Shortly before the entry of this country into the war it was realized that we were in a very vulnerable position with respect to the control of rats and rat borne epidemics. Red squill, the staple rat poison, was no longer available in adequate amounts because the Axis powers held the sources of supply along the Mediterranean seaboard. Other possible poisons were eliminated by critical requirements or potential hazards in use.

The wide and prolonged use of phenyl thiourea for taste and inheritance tests without any accidents indicated that it probably does not have any toxic action on man. This probability, coupled with its high toxicity to rats, made it seem an excellent candidate as a substitute for red squill. Through the interest of Colonel Perrin Long, at that time chairman of the Committee on Chemotherapeutic and Other Agents of the Division of Medical Sciences of the National Research Council, a grant was given to this laboratory to test phenyl thiourea as a rat poison and also to determine which baits would serve most effectively in its use. The work was begun in January 1942.

FIELD TRIALS AND METHODS OF SYSTEMATIC RAT CONTROL

Preliminary tests with phenyl thiourea on several city dumps and large grocery stores in Baltimore were not satisfactory. Some rats were killed but many survived, as shown by consumption of plain baits offered subsequently. A number of wild rats were therefore trapped, brought into the laboratory and offered phenyl thiourea baits along with unpoisoned food. A definite discrimination against poisoned baits was immediately apparent, and it was concluded that the bitter taste was responsible for the poor results obtained in the field.

A search was accordingly started for a thiourea derivative which would have the same high toxicity as phenyl thiourea without its bitter taste. A request to the E. I. du Pont de Nemours Company for thioureas and related compounds which might possess the desired characteristics brought a prompt and helpful response. Over one hundred samples were sent within a short time. These were screened by administering 100 mg. doses to laboratory rats by stomach tube, followed by progressively lower doses whenever the compound killed the rats. In this way nine compounds were found which possessed toxic values comparable to phenyl thiourea. These were then offered to rats in 1 per cent mixtures with finely ground yellow corn. Of the nine, alpha-naphthyl thiourea (a fine gray insoluble powder with very little odor or taste) was most readily accepted. Further tests in which alpha-naphthyl thiourea poisoned baits were offered to groups of laboratory rats showed

that complete kills were generally obtained, even when unpoisoned food was available at the same time. Laboratory tests were then made with captive wild Norway rats and equally satisfactory results obtained.

Following these encouraging observations, further trials in the field were instituted. Recognizing the inadequacy of individual houses and yards as test areas, it was decided to adopt the city block as a minimum unit for poison treatment. Subsequent observation showed the wisdom of this decision, since the four streets surrounding a block were found to form natural barriers which rats rarely crossed, except under special circumstances, while local movements from yard to yard within a block were common.

During the next three years a number of experimental campaigns were undertaken in different parts of the city of Baltimore, some on a small and others on a large scale. In general the smaller campaigns were directed toward solving problems of technic, such as optimum concentrations of alpha-naphthyl thiourea in bait and most suitable baiting procedures, while the larger ones were aimed more at elucidation of problems dealing with workers and assistance from various civic and social organizations. For the information of those who may want to undertake similar campaigns in other cities, a brief chronologic account is given here of the results obtained in each of these undertakings.

Eight blocks in the city of Baltimore were treated in the first trial. Baits composed of yellow corn meal with 1 per cent alpha-naphthyl thiourea and sections of fresh ears of corn with the grains split and lightly dusted with alpha-naphthyl thiourea were distributed to every house, cellar and yard by Boy Scouts. The results were promising. Large numbers of dead rats were recovered, and inhabitants reported very few survivors.

More extensive tests now seemed to be warranted with a view to working out a plan and method for a citywide campaign. Questions of personnel, poisoning technic, type of bait and precautions for protecting the public were therefore discussed with municipal authorities of Baltimore. An appropriation of \$5,000 was provided by the city in October 1942 for the hiring of men; the Office of Scientific Research and Development continued to provide the bait and poison.

The Eastern Health District, a densely populated and heavily rat infested area, covering about two hundred blocks around the Johns Hopkins Hospital, was selected for the first large scale test. A crew of men was procured and a standardized bait of finely ground corn with 1 per cent alpha-naphthyl thiourea was decided on. The men worked in pairs distributing the bait in paper cups in the houses, cellars and yards of each block. Dead rats were picked up on the following days, and a house to house survey was made several weeks later to secure reports from the residents on the persistence of rats.

The results obtained were irregular. Some blocks reported very few survivors, others reported many. Up to 100 dead rats were recovered in certain blocks, while in others only a few were found. An investigation of the causes of failure at this time showed that many houses had been missed or hastily treated by unreliable crew members. At least some of the low kills could be attributed to this.

A series of more intensive and careful block campaigns was organized in another section in May 1943, using a group of fifteen young and enthusiastic air raid war-

5. Richter, C. P., and Clisby, Kathryn H.: Toxic Effects of the Bitter Tasting Phenylthiocarbamide, *Arch. Path.* 33: 46 (Jan.) 1942.

dens as volunteer workers. Preparations included the distribution of typewritten notices and the initiation of a general clean-up campaign culminating in a special garbage collection immediately preceding the poisoning.

This time alpha-naphthyl thiourea was used in three types of bait: it was dusted over diced apples and sweet potatoes, offered in spoonful piles of a 1 per cent mixture with cornmeal, and put out in protected places (inaccessible to children and pets) as a suspension in water. Emphasis was placed on thoroughness, and it was believed that very few rat infested places were missed. Dead rats were collected two days later and all burrows firmly closed on the third and fourth days. More poison baits or traps were promptly set out wherever holes reopened or other fresh rat signs were seen.

Results in this campaign were good. Many dead rats were recovered even where they had not been suspected and very few holes were reopened. Residents and air raid wardens, acting as inspectors, found very few rat signs in this area for many months; a few blocks have remained clear of rats up to the time of this writing, two and one-half years later, as determined from reports and from surveys conducted by trained men.

The good kill obtained in all of these blocks and the outstanding success obtained in a few indicated that satisfactory results were attainable with alpha-naphthyl thiourea as a field rodenticide. The thoroughness of distribution, the use of several alternate baits and the preliminary clean-up were all considered to have contributed materially to the success of the campaign.

A more extensive experimental program was next set up under city appropriations of \$55,000⁶ which provided for a centrally located rodent control office with a director, office help, field workers, a health inspector and technical assistants for an eighteen month period. New blocks were treated following the pattern set in earlier tests but with several added features. Printed notice cards were prepared and large posters of two types were made to be placed in conspicuous parts of the blocks; one type, printed in red, announced the campaign for the block; a second, in black, which was substituted for the red poster after the campaign had been completed, reported that the job had been done and requested residents to communicate any recurrence of rats to their block inspector, whose name and address appeared at the bottom. Special attention was also given to the reappearance of rats in previously treated blocks. For this purpose a force of volunteer block inspectors was organized. Each inspector was asked to make a monthly door to door canvass of his or her block and submit a report on sites of persisting or reappearing trouble. A field crew was then dispatched to the scene to distribute poison, set traps or fumigate burrows with cyanogas dust.

In all about 1,360 city blocks were treated with alpha-naphthyl thiourea during this eighteen month period. The results in general were fairly good although still far from perfect: in most blocks the kill was about 90 per cent, based on estimates of total rat populations obtained in intensive trapping campaigns.

Budget limitations and the wartime scarcity of capable field workers demonstrated that any expansion of

the program during 1945 would have to depend on volunteer participation. Experience had shown furthermore that there were many advantages to be gained by the continuous personal attentions which could be devoted to a block by its interested residents. A system of volunteer workers was accordingly organized and a new twelve month budget of \$49,000 was appropriated by the city for office personnel, a limited field force and the purchase of grain bait; alpha-naphthyl thiourea was again furnished by the Office of Scientific Research and Development in return for reports on results.

At the present time, up to Aug. 1, 1945, over 1,500 citizens have volunteered to do the work of treating and repeatedly checking for rats in their home blocks and have been given detailed instructions and baiting materials by the City Rodent Control Office. They have, to date, treated and placed under their permanent supervision about 2,830 blocks comprising about three fourths of the heavily populated portion of the city. An effective procedure has been developed by which volunteer workers can be recruited, organized, instructed and put to work through circulars and petition forms distributed by the Rodent Control Office and through talks and field demonstrations by trained city employees.

At present, alpha-naphthyl thiourea is being effectively used in five different ways: (1) in a mixture (2 to 5 per cent) with finely ground grain such as corn or wheat, (2) as a spray or dust on ground grain or on fruit or vegetables such as diced apples, sweet potatoes or tomatoes, (3) as a dust in pure form or mixed half and half with flour, to be placed on floors and runways, (4) as a dust on the surface of water and (5) as a dust blown into the burrows and holes with a standard cyanogas dust pump.

At no time in the course of this rather extensive field trial have toxic symptoms attributable to alpha-naphthyl thiourea been observed in the workers or in the more than 500,000 residents of Baltimore who have come in contact either with the poison as such or with poisoned baits, and this despite what at times was undoubtedly very casual handling. Some dogs have, however, been accidentally killed. When alpha-naphthyl thiourea was administered in food to dogs under laboratory conditions a number were observed to vomit and so rid themselves of the poison. Retching has also been observed in dogs after intravenous administration of alpha-naphthyl thiourea; so it may be assumed that alpha-naphthyl thiourea has an emetic quality which would protect dogs under favorable conditions but not rats, since rats are not able to vomit.

There is doubtless still much to be learned on the effective use of alpha-naphthyl thiourea as a rodenticide, but we believe, on the basis of experiences described in this report, that procedures have been developed by which in an emergency the rat population of a city could be brought under control in a very short time.

LABORATORY OBSERVATIONS

Parallel to trials in the field, intensive studies were carried out in the laboratory. Some of these were directed toward the development of specifications for the product while the rest involved testing of various baits, comparison of alpha-naphthyl thiourea with other poisons and investigating the mechanism of action with a view to developing an antidote.

Of special importance, particularly during wartime, is the fact that the manufacture of alpha-naphthyl

6. The appropriations were made largely through the efforts of Mayor Howard B. Jackson and Mayor Theodore McKeldin and Dr. Huntington Williams, the commissioner of health.

thiourea does not involve any expensive materials or any of those on the critical list.

It has been found that the effectiveness of alpha-naphthyl thiourea depends to some extent on particle size: an average diameter of 5 to 10 microns has proved best for dusting work, while a larger size, approximately 100 microns, gives best results in food mixtures.

Alpha-naphthyl thiourea is very stable and does not deteriorate on prolonged storage. Because of its high melting point, 184 C., it is unaffected by temperatures well above those normally encountered. It is also practically insoluble in most liquids. Its solubility in water is somewhat higher in the presence of alkalis than in neutral or acid solutions but is still only a few milligrams per hundred cubic centimeters.

The bioassays and other tests were performed in large part with trapped wild rats provided by the city in partial return for the poison supplied by the Office of Scientific Research and Development. Special methods were developed for handling and housing large numbers of wild rats. An effective device was worked out for handling these rats without anesthesia,⁷ by means of which wild rats taken from the streets could be removed from their cages, weighed, injected or tube fed and then returned to their cages at the rate of 20 or 30 per hour; this is only slightly longer than would be required to carry out the same operations on tame rats.

Large cylindric metal pens 10 feet in diameter and 4 feet high were constructed for use in observing the reactions of rats to various baits, poisoned and unpoisoned, in which the effectiveness of alpha-naphthyl thiourea and other poisons could be studied under controlled conditions. The results obtained in these pens on the voluntary acceptance by wild rats of various poison baits have proved fundamental to our work and have disclosed a number of previously unsuspected facts about the eating habits and general behavior of wild rats. In these pens we have found that alpha-naphthyl thiourea bait is eaten without hesitation by the rats, even in concentrations as high as 20 per cent; it has also been observed that the voluntary acceptance of alpha-naphthyl thiourea compares very favorably with other standard rodenticides.

Comparisons were made between the toxicity of alpha-naphthyl thiourea and other poisons that have been or are being used to exterminate rats. The poisons were administered to wild Norway rats by stomach tube. Alpha-naphthyl thiourea at an LD₅₀ level of 7 mg. per kilogram was found to compare favorably with thallium sulfate at 16, zinc phosphide at 40, arsenic trioxide at 140, fortified red squill at 150 to 300 and barium carbonate at 1,500 mg. per kilogram of body weight. It is not so toxic to rats as 1080, the new rodenticide recently announced by the Fish and Wildlife Service,⁸ but it has a much higher safety factor, because 1080 is much more toxic to all other animals, including man.

A number of experiments have been made on the toxicity of alpha-naphthyl thiourea to other animals. Only the Norway rat, the mouse and the dog were killed by doses less than 100 mg. per kilogram of body weight. The Alexandrine rat, the squirrel and the guinea pig required doses between 100 and 400 mg. per kilogram to succumb, while monkeys, rabbits and chickens were even more resistant: 5 Gm. per kilo-

gram was required to kill 100 per cent of groups of chickens and monkeys.

A most interesting, but in some ways very disappointing, finding was that alpha-naphthyl thiourea does not have the same high toxicity for the Alexandrine or black rat, a common species of rat in many parts of the world but rarely found in Baltimore. It would appear that in general alpha-naphthyl thiourea is more effective on carnivorous than on herbivorous animals. In this connection may be mentioned the great differences in the toxicity of the parent compound thiourea which we have recently observed in three strains of Norway rats belonging to the same species but living on different diets.⁹ With an LD₅₀ of 4 mg. per kilogram for our stock of domestic rats, the value for another domestic colony was found to be 640 while for wild rats from the field it was 1,830 mg. per kilogram. When all three strains were fed our stock diet for extended periods of time, however, these differences in susceptibility were almost if not completely overcome and the same low LD₅₀ value was approached by the two more resistant strains.

Since it had been observed that tolerance to phenyl thiourea could be built up in laboratory rats,⁵ studies were initiated to investigate the same phenomenon with alpha-naphthyl thiourea and wild rats. It was found that wild rats develop a tolerance to alpha-naphthyl thiourea quite readily; in fact, some of our experiments indicate the existence of some degree of tolerance as early as two or three hours after ingestion. This tolerance disappears completely, however, in thirty to forty days after discontinuance of the poison. The basis for the development of tolerance in the wild Norway rat and the relation to the natural tolerance in the Alexandrine rat and in the other herbivorous animals has not been determined. It has been found, however, that young wild Norway rats, that is, below the age of puberty, have up to seven times as much natural resistance as is found in the same rats when they are mature.

Extensive experiments were undertaken on the mechanism of action and pathology of alpha-naphthyl thiourea, in part to work out an antidote and in part to determine whether information could be obtained to make the compound even more effective and possibly to discover new and more effective thioureas. From experiments that have been carried out on Norway rats and on dogs it is clear that in these two species death is due to the development of a drowning pulmonary edema. This edema results from a greatly increased permeability of the lung capillaries and possibly also from some slight damage to the lung capillaries. Neither the heart nor any other organ appears to be affected. The amount of the fluid which permeates the capillary walls and the speed with which it goes through the walls after the administration of the poison was beautifully demonstrated by experiments on dogs carried out by Dr. Cecil Drinker, who observed the lymph flow from the lungs and heart.¹⁰ The flow of lymph began to increase within slightly more than ninety minutes after alpha-naphthyl thiourea was injected into the dog's vein and continued to increase at a rapid rate until at the end of eight hours it attained a level eighty times higher than

7. Emilen, J. T., Jr.: *J. Wildlife Management* 8: 264 (July) 1944.

8. Kalmbach, E. R.: *Science* 102: 232 (Aug. 31) 1945.

that present before the administration of alpha-naphthyl thiourea. Dr. Drinker stated that in all his studies of lymphatic flow he had never seen anything to compare with it.

The mechanism involved in this increased permeability of the capillary membranes has not been determined. It is possible that alpha-naphthyl thiourea acts adversely on some enzyme system. The antioxidant action, which may be a property of alpha-naphthyl thiourea as well as of phenyl thiourea and thiourea, could also play a part. It is possible that alpha-naphthyl thiourea may act on some amino acids in the body, particularly cystine, since experiments in this laboratory have shown that, while small amounts of alpha-naphthyl thiourea administered chronically cause cessation of hair growth, this effect is counteracted by feeding suitable amounts of cystine.

The factors involved in the absorption of alpha-naphthyl thiourea in the body remain unknown. Despite its very low solubility in water alpha-naphthyl thiourea seems to be fairly rapidly absorbed in the body whether introduced orally or parenterally. The toxicity of alpha-naphthyl thiourea depends to a certain extent on the rate of absorption: the more rapidly it is absorbed, the more certain the animal is to die.

Thus in case of accidental or intentional human poisoning with alpha-naphthyl thiourea we recommend first of all immediate stomach lavage, secondly administration of oxygen possibly under increased pressure and thirdly the avoidance of fluids, particularly alkaline fluids. It may also be wise to avoid fats, since some of our evidence indicates that alpha-naphthyl thiourea may be more readily absorbed in their presence.

At this point attention may be drawn briefly to certain aspects of the chronic action of alpha-naphthyl thiourea, phenyl thiourea, and also of thiourea, which are of general physiologic interest quite apart from their relation to the problem of killing rats. All three drugs produce hyperplasia of the thyroid gland. This hyperactive condition of the gland apparently results from interference with the production of thyroid hormone. Mainly through the efforts of Dr. E. B. Astwood thiourea and more recently the closely related compound 2-thiouracil have come to be widely used clinically in the treatment of hyperthyroidism.¹¹ For this purpose it is obvious that the less toxic the thiourea derivative the greater advantage it has.

All the mono substituted thiourea derivatives we have tested produced pulmonary edema and pleural effusion in the laboratory rat. Apparently an inverse relationship exists between the pulmonary edema and the effusion, since we have observed that the edema is greatest during the first few hours after the poisoning and at a time when there is little pleural effusion. The longer the animals survive, the greater the effusion becomes and the less pronounced is the edema. It is interesting to note that administration of these thioureas to rats is followed within two hours by a definite and persistent lowering of body temperature; values below 94 F. are regularly observed.

The effects produced by the thioureas on the pigmentation of the skin and hair and on hair growth in black Norway rats are also very interesting. It has been observed in this laboratory that, while in nonlethal con-

centrations thiourea has little or no effect either on pigmentation or on hair growth, phenyl thiourea definitely destroys the pigment both in the skin and in the hair without affecting hair growth while alpha-naphthyl thiourea completely stops both pigment production and hair growth. Withdrawal of phenyl thiourea is followed in less than ten days by greatly increased pigment production, and similarly cessation of alpha-naphthyl thiourea treatment is followed by renewed pigment production and hair growth. These observations open up a wide field of investigation of the action of the compounds on enzyme systems and also on dietary constituents.

SUMMARY

A new rat poison, alpha-naphthyl thiourea (abbreviated ANTU) has been discovered which compares very favorably with other rodenticides at present available as to cost, toxicity and voluntary acceptance by rats.

It is a relatively specific poison for Norway rats, being less toxic to all other species tested. Its emetic property protects dogs in most cases. No human fatalities or toxic symptoms in human beings have been observed during three years of extensive use in a city.

Experience gained from large scale municipal rat control campaigns, using alpha-naphthyl thiourea as the exclusive poison, indicates that observance of the following points is essential to success: 1. Poisoning should not be attempted in any area smaller than a whole city block at a time. 2. The coverage with poisoned bait must be scrupulously complete throughout the block. 3. The cooperation of residents is essential to the permanent control which must follow any intensive campaign. With suitable publicity, materials and cooperation the rat population of a large city can be substantially reduced in a short time should circumstances require it.

Alpha-naphthyl thiourea kills rats and dogs by its action on the capillaries of the lungs, producing drowning pulmonary edema. No antidote is yet available, but the great insolubility of alpha-naphthyl thiourea makes prompt stomach lavage a useful countermeasure. Should pulmonary edema develop following accidental human poisoning, oxygen should be administered but no fluids should be given either by mouth or intravenously.

Furthermore, alpha-naphthyl thiourea provides a valuable new tool for research, both in its acute effects involving so specific a site of action and such a rapid increase in lymph flow, and in its chronic effects, which parallel those obtained with thiourea and 2-thiouracil and in addition include disappearance of pigment and cessation of hair growth in black Norway rats.

Epidemic Typhus.—Epidemic typhus, as it is seen in eastern Europe or North Africa, is a fully established human infection, but there is fairly strong historical evidence that the typical disease has been known in Europe only since the fifteenth century. Zinsser's assumption that the typhus rickettsia is an ancient parasite of the rat and its fleas, and that the murine form is ancestral to the classical type spread from man to man by the louse, is fairly generally accepted. But in these rickettsial diseases we have a complex evolutionary problem in which the part played by the arthropod vector dominates the picture. There are good reasons for believing that the rickettsias are organisms which developed originally as saprophytes or semi-parasites in the gut of the arthropod and were transmitted to the next generation through the egg.—Buriet, Frank MacFarlane: *Virus as Organism*. Cambridge, Mass., Harvard University Press, 1945.

11. Astwood, E. B.: Treatment of Hyperthyroidism with Thiourea and Thiouracil, *J. A. M. A.* 122: 78 (May 8) 1943.

1 patient with a metastatic mediastinal tumor and primary hyperthyroidism, 1 patient with recurrent primary hyperthyroidism and 1 patient, thyrocardiac with an adenomatous goiter, who refused operation after thiouracil preparation. One patient with severe recurrent primary hyperthyroidism was prepared for operation but refused it, so the medication was discontinued. One patient who was fever sensitive to thiouracil received thiobarbital for only eight days, when fever developed and treatment had to be discontinued.

Thiobarbital has been given to 9 patients who could not tolerate thiouracil because of the development of fever in 6, leukopenia and granulocytopenia in 1, granulocytopenia in 1 and swollen salivary glands in 1. Of the 6 patients in whom fever developed from thiouracil, 3 tolerated the thiobarbital (chart 2) but 1 patient developed both leukopenia and granulocytopenia after eight days of treatment, 1 patient had fever on the eighth day and 1 patient (chart 1) developed a mild fever after prolonged administration. The 2 patients (chart 3) in whom changes in the white blood cells took place and the 1 patient who developed swollen salivary glands (chart 4) from thiouracil were able to tolerate thiobarbital until maximum preoperative treatment was obtained.

Of the 19 patients given thiobarbital as initial therapy, 5 developed toxic reactions. One developed fever on the eighth day and 1 on the twelfth day; the latter patient tolerated a reduced dose of 0.1 Gm. (chart 6) the initial dose being 0.2 Gm. Two patients developed agranulocytosis,⁴ 1 on the fourteenth and the other on the twenty-fifth day of treatment. Moderate leukopenia and granulocytopenia (white blood cells 2,200, polymorphonuclear cells 39 per cent) developed in 1 patient on the twenty-first day. The 2 patients who developed agranulocytosis were treated successfully with penicillin (chart 5). The patient with moderate white cell changes was asymptomatic but she was also given penicillin. The white blood cells returned to normal in eight days. The 4 patients in whom the thiobarbital was stopped received Lugol's solution to complete the preoperative preparation.

Of the total 28 patients (9 patients receiving thiobarbital after thiouracil and 19 receiving thiobarbital initially) 8 (table 2), or 28 per cent, developed toxic symptoms. In 7 patients the treatment was discontinued; 1 patient tolerated a reduced dose. This percentage of reactions from thiobarbital is about three times as great as that which we observed from the administration of thiouracil, with which 23 reactions occurred in 196 patients, or 11 per cent.

The reactions to thiobarbital were found to be just as prevalent on a dose of 0.2 Gm. as on a dose of 0.1 Gm., 4 in each instance. One patient (chart 6), however, was found to tolerate a dose of 0.1 Gm. after fever developed from the 0.2 Gm. dose. Seven patients who received 0.05 Gm. had no toxic manifestations. Further observations of a large series will be necessary to determine whether there is a relation between size of dose and chance of a toxic reaction which was not found with thiouracil when reactions occurred on very small doses. As with thiouracil, no relationship was noted between duration of treatment and onset of reaction. With thiouracil most fever reactions occurred on the ninth to

Chart 3.—Blood changes following thiouracil, with subsequent thiobarbital administration, in a woman aged 29, with severe primary hyperthyroidism.

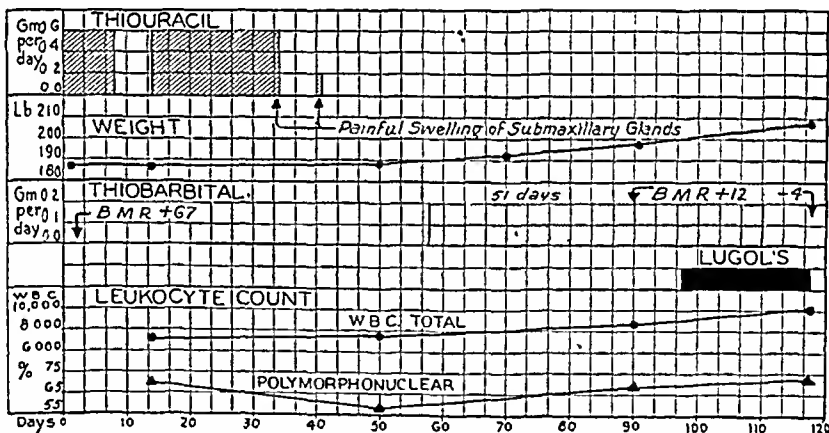

Chart 4.—Development of swollen salivary glands from thiouracil, with subsequent thiobarbital administration, in a woman aged 40, with recurrent primary hyperthyroidism (severe).

tenth day, with thiobarbital on the eighth to twelfth day and in 1 case after five months of treatment. This experience with the increased frequency of reactions to thiobarbital has led to the therapeutic policy of resorting to thiobarbital only for patients who have reactions to thiouracil. In this role it has been of great help.

DURATION OF TREATMENT

Response to treatment was found to be similar in every respect to that observed with thiouracil. Improvement occurred within seven days of starting therapy and continued until full control of all objective and subjective signs and symptoms of hyperthyroidism was obtained. In the use of thiobarbital as with thiouracil, it was found that it took approximately one day of treatment for each percentage of elevation of metabo-

4 Of the 2 patients developing agranulocytosis, 1 received pyridoxine and the other folic acid with the thiobarbital. Neither substance seems to prevent the development of blood changes.

5 Bartels, E. C., and Blizard, E. C. Toxic Reactions to Thiouracil. *Lancet Clin. Bull.* 4: 150-155 (July) 1945.

lism, as shown by 9 cases with an average initial basal metabolic rate of +46. The average final basal metabolic rate was +8 after an average of forty-one days of treatment. Previous iodine therapy retarded the action of thiobarbital as it did with thiouracil. The dose of 0.2 Gm. daily was used for the first patients treated, but at the suggestion of Dr. Astwood the dose was cut to 0.1 Gm. a day. The response seemed as prompt and satisfactory, so now a dose of only 0.05 Gm. is being used, with speed of improvement comparable to that observed with the larger doses. The length of time thiobarbital was administered to the 28 patients varied from eight to one hundred and seventy-three days.

Those patients having thyroidectomy after optimum preparation with thiobarbital had an anesthesia and a postoperative course equally satisfactory to those patients receiving thiouracil preparation. Of the patients having operation, 21 had subtotal thyroidectomy. There was no postoperative death. The pathologic report on the thyroid tissue removed was in no way different from that after treatment with thiouracil.

The thiobarbital treated patients were given iodine for three weeks preoperatively to accomplish involution of the thyroid gland, as with thiouracil management.⁶ No surgical difficulty was encountered in the removal of these thyroid glands.

SUMMARY

1. Twenty-eight patients with hyperthyroidism have received thiobarbital, and definite and satisfactory antithyroid response was obtained in all.

2. Of 9 patients in whom toxic reactions to thiouracil developed, 7 tolerated thiobarbital, accomplishing complete relief of hyperthyroidism.

TABLE 2—Reactions to Thiobarbital

	Cases
A Level	
a 12th day	1
b 8th day	2
d Fever late (after 5 months of treatment)	1

Bull.* 4:23 (July) 1944; Thiouracil, editorial, *Surg., Gynec. & Obst.* 81:335-336 (Sept.) 1945. Lahey, F. H.; Bartels, E. G.; Warren, Shields, and Meissner, W. A.: Thiouracil: Its Use in the Preoperative Treatment of Severe Hyperthyroidism, *Surg., Gynec. & Obst.* 81:423-419 (Oct.) 1945.

uracil treated patient. The combined use of thiobarbital and iodine produced satisfactory involution of the thyroid gland.

6. The high percentage of reactions to thiobarbital has led to the use of thiobarbital for only those patients unable to tolerate thiouracil.

DIAGNOSIS OF CHANCROID

THE RELATIVE EFFICIENCY OF BIOPSIES, CULTURES,
SMEARS, AUTOINOCULATIONS AND SKIN TESTS

ALBERT HEYMAN, M.D.

PAUL B. BEESON, M.D.

AND

WALTER H. SHELDON, M.D.

ATLANTA, GA.

The methods employed at present for the diagnosis of chancroid are far from satisfactory. Current textbooks indicate that accurate diagnosis can be based on the clinical features, on the results of skin tests or on examination of stained smears. Most venereologists, however, know that each of these methods is subject to major limitations and errors. Actually at present the diagnosis is usually based on negative dark field examinations for spirochetes and on clinical improvement after institution of sulfonamide therapy. The establishment of reliable criteria for a positive diagnosis of chancroid would unquestionably be of value.

The present article is a report on the relative efficiency and usefulness of a number of diagnostic procedures in chancroid. These findings were obtained during an intensive study of a group of 125 patients suspected of having either chancroid or lymphogranuloma venereum. Efforts were made to culture the *Ducrey* bacillus or to demonstrate the presence of the virus of lymphogranuloma venereum whenever feasible. In addition, most of the commonly recommended diagnostic procedures for both diseases were carried out. A positive diagnosis of chancroid was established in 60 of the 125 cases by culture, by biopsy or by both methods. It is our purpose to discuss the practical value and limitations of these two procedures and to compare them with such methods as smears, skin tests and autoinoculations. To our knowledge there has been no comparable study in which evaluation of diagnostic tests has been based on proved cases of chancroid.

METHOD OF STUDY

Patients selected for this study were admitted to a special clinic in the Genitoinfectious Disease Department of Grady Hospital. At the first visit a complete history was taken and physical examination was made; blood specimens were collected and dark field examinations, smears, cultures, autoinoculations, skin tests and biopsies were carried out. Patients were instructed to return at the end of forty-eight hours for a reading of skin tests and autoinoculations and for repetition of smears and cultures. Chemotherapy was begun at that time. Patients then returned at weekly intervals for the first month and every two or three weeks thereafter for a period of at least ten weeks. At each visit blood was taken for Kahn and Wassermann tests, protein determinations and complement fixation tests for lympho-

granuloma venereum. Skin tests were also repeated when indicated.

Of the 125 patients admitted to the study, a diagnosis of chancroid was regarded as established in 60 by biopsy, by culture or by both methods. All of these 60 patients were Negroes; 38 were males and 22 were females. The duration of symptoms ranged from three to forty-two days, the average being sixteen days. Of the remaining 65 patients 14 were proved to have lymphogranuloma venereum by virus isolation, 6 were contacts of these cases and 14 had other genital lesions such as syphilis, granuloma inguinale and herpes. Eight patients became delinquent before sufficient laboratory studies had been obtained. The diagnoses in the remaining 23 cases (in 20 of which there were no primary lesions) could not be established with certainty. Eighteen of them appeared clinically to be lymphogranuloma venereum while 5 appeared to be chancroid.

BIOPSY

The histologic changes occurring in chancroid are generally believed to be nonspecific. For this reason biopsy has seldom been employed as a diagnostic method. In addition, the removal of tissue from the genitalia has been regarded as too formidable a procedure for routine clinic practice. Greenblatt,¹ however, has recently indicated that the histologic changes occurring in chancroid may occasionally suggest the diagnosis and that biopsy may at times be of value.

In this investigation the histology of chancroid has been carefully studied and we believe that the histologic pattern of this infection is sufficiently distinct to permit a reasonably certain diagnosis in nearly every instance. In fact, in our experience biopsy appeared to be the most efficient single method of diagnosis. Biopsy can be performed in an outpatient clinic with relative ease. Our practice was to remove a portion of tissue from the ulcer or wall of a ruptured bubo with a Gaylors biopsy forceps. No anesthesia was used, and it was possible to obtain a fragment of tissue averaging 3 mm. in diameter with little pain and without troublesome bleeding. Biopsies were done in 59 of the 125 cases in this series, and a histologic diagnosis of chancroid was made in 45 instances. In 35 of these the diagnosis of chancroid was confirmed by positive culture for the *Ducrey* bacillus. In all 10 cases in which the organism could not be cultured the clinical features were consistent with the diagnosis of chancroid. In the remaining 14 cases lymphogranuloma venereum was diagnosed in 7, granuloma inguinale in 2, syphilis in 2 and nonspecific inflammatory process in 3.

A description of the technic for histologic diagnosis of chancroid has been given in detail in another article.² For good results it is essential that care be observed in the fixing and staining of the tissue. On examination of the sections, the lesion is found to consist of three zones. The surface zone or base of the ulcer is rather shallow and is made up of polymorphonuclear leukocytes, fibrin, red blood cells and necrotic tissue. Below this is a fairly wide layer of edematous tissue in which endothelial cells in various stages of proliferation outnumber all other cellular components. Newly formed blood vessels are numerous and may show palisading with occasional degeneration of the vessel walls and thrombosis. Finally there is a deep zone in which

there is a dense infiltration by plasma cells and lymphocytes. Demonstration of Ducrey bacilli in the tissue is occasionally possible.

CULTURE

Demonstration of the etiologic agent is obviously a desirable method of diagnosis but is rarely employed. Teague and Deibert³ in 1920 reported very favorably on the possibilities of culture diagnosis, but more recent writers have not recommended it. During the present study considerable attention was devoted to the possibilities of the cultural method of diagnosis, and some success was attained. The technique eventually adopted, a modification of that used by Teague and Deibert, has been described in detail elsewhere.⁴ Whole defibrinated rabbit blood was used as a culture medium, and diagnosis was based on recognition of the typical morphology and staining of the Ducrey organisms in smears of the culture after twenty-four to forty-eight hours' incubation.

In this series cultures were made of all genital lesions and of all material aspirated from buboes. Cultures were positive for the Ducrey bacillus on one or more occasions in 50 patients. In 10 additional patients culture was negative but biopsy revealed the typical microscopic appearance of the chancroid lesion. In these 10 cases the lesions were either in the vagina or on the cervix or had been present for a long time. Since such lesions are nearly always heavily contaminated by other bacteria, cultural demonstration of the Ducrey bacillus is difficult.

Cultures of primary lesions were positive more frequently than were cultures of the associated buboes. Only 11 of 24 bubo cultures in the 60 proved cases of chancroid were positive.

SKIN TEST

Although opinions have varied as to its specificity and sensitivity, the skin test with Ducrey vaccine has been widely used as a specific diagnostic test for chancroid. Some workers⁵ have reported positive skin reactions in approximately 95 per cent of the cases of chancroid. Others⁶ found that only 70 to 80 per cent of the cases showed positive skin tests. It is noteworthy that these reports were based on clinical diagnosis only.

In the present study all patients were tested with a commercial Ducrey vaccine (Lederle). The development of an area of induration 6 mm. or more in diameter forty-eight hours after the inoculation was regarded as a positive reaction. Positive skin tests were found in only 46 of the 60 proved cases of chancroid. In 10 of the 14 patients who originally showed negative reactions, skin tests were repeated four to ten weeks later and were still negative.

A further limitation of the value of the skin test for chancroid lies in the fact that the positive reaction persists for years after its development. One cannot be certain, therefore, whether a positive test represents the existing infection or a previous one. In this connection we have recently carried out a skin test survey

on 473 Negro hospital patients, none of whom were known to have had chancroid recently. Approximately one third of adults over 25 years of age gave a positive reaction.⁷

Even when skin tests for both chancroid and lymphogranuloma venereum are done, the results may be confusing. Positive reactions for lymphogranuloma venereum are very commonly encountered in Negroes. In the group of 60 proved cases of chancroid, 20 patients gave positive skin reactions for both diseases. Twenty-six patients reacted only to the Ducrey vaccine, while in 4 patients the results of the skin tests were entirely misleading, the Ducrey reaction being negative and the lymphogranuloma venereum test being positive. It is obvious, therefore, that skin tests alone are of limited value in the differential diagnosis of chancroid.

AUTOINOCULATION

The value of autoinoculation as a diagnostic method was investigated in 36 of the 60 proved cases of chancroid. In this procedure a loopful of exudate from the genital ulcer is rubbed into a scarified area on the forearm. The area is then bandaged and kept covered for forty-eight hours, at which time the result is determined. A take is indicated by the development of small pustules or ulcerations in which Ducrey bacilli can be identified either by smear or by culture. In 20 of the 36 cases a positive diagnosis was possible from the autoinoculation; in the remaining 16 cases no lesion developed in forty-eight hours. There were only 2 cases in the entire series wherein the Ducrey bacillus was cultured successfully from the autoinoculation and not from the primary lesion.

Autoinoculation has several disadvantages. As noted in the foregoing paragraph, lesions do not always develop at the site of the inoculation. Furthermore, the development of a pustular lesion is not proof of the diagnosis of chancroid, since pyogenic bacteria may be transferred from the genital lesion. Autoinoculation therefore still imposes the necessity of proving the diagnosis by the use of smears or cultures. Moreover, the establishment of a new area of infection is not devoid of danger. While the lesion is inconsequential at the end of forty-eight hours and recedes promptly with sulfonamide therapy, it may, without treatment, develop into a serious infection. A few patients in this series neglected to return to the clinic for a week or more, at which time large chancroidal infections of the arm had developed. Another disadvantage of autoinoculation is that it necessitates delay in treatment, which must be withheld until the result can be determined. For these reasons we believe that autoinoculation is of limited value as a method of diagnosis and that it cannot be recommended for general use.

SMEARS

It would indeed be convenient if a diagnosis of chancroid could be made in a majority of cases simply by demonstrating Ducrey bacilli in stained smears from genital lesions. Different workers have reported varying success with the method. Among recent favorable reports are those of Greenwald,⁸ who obtained positive smears in 65 per cent of 76 soldiers thought to have chancroid, and of Kornblith, Jacoby and Chargin,⁵ who

claimed a positive diagnosis from smears in 88 per cent of 175 cases. On the other hand, many workers are less enthusiastic about this method. In the U. S. Army, for example, smears are not recommended.⁹

The diagnosis of chancroid by means of direct smears is based on certain characteristics of morphology, staining and arrangement of the Ducrey bacilli. The organisms are short, plump, gram negative bacilli with rounded ends. When stained by the method of Pappenheim or Sellers they exhibit a tendency to bipolar staining which gives some of them the "closed safety-pin" appearance. The Ducrey bacilli may be situated intracellularly, but more often they lie outside the cells, singly or in small clusters, as shown in the photomicrograph. Greenblatt¹ and Kornblith, Jacoby and Chargin⁵ have stressed the "school of fish" arrangement in which the bacilli are grouped in long parallel columns between cells or shreds of mucus. This arrangement was noted in only a few cases in this series.

Another feature of the direct smear which is often mentioned¹⁰ is the finding of Ducrey bacilli in long chains. In our experience this is also a very rare occurrence.

The positive smears in chancroid usually show relatively few organisms, particularly in early lesions. In advanced cases, especially in female patients, smears are frequently crowded with different bacteria, and under these circumstances it is impossible to make a diagnosis. Some writers have advised that in such cases cleansing soaks should be applied for a day or two and the smear examination then repeated. We have not regarded this practice as desirable, since it would necessitate withholding therapy for one or more days.

In this study smears were made from lesions and bubo material whenever possible. We were able to obtain a positive diagnosis of chancroid by examination of smears in 31 of the 60 proved cases. Ducrey bacilli were seldom found in smears of bubo pus, even when their presence was subsequently established by culture.

In examining smears it was found advantageous to use both Gram and Pappenheim stains. The Gram stain gives a comprehensive picture of the bacterial flora present in the lesion. When organisms showing the typical morphology, staining and arrangement of Ducrey bacilli are seen in the Gram stain, and when the Pappenheim stain subsequently reveals the presence of "safety-pin" forms, the diagnosis of chancroid is reasonably certain.

COMMENT

A positive diagnosis of chancroid can be made in a high proportion of cases by the use of appropriate diagnostic procedures. No one method will be applicable in all cases, and the diagnostic procedure must be selected for individual cases.

The choice of diagnostic tests in the presence of a primary lesion depends principally on the size of the ulcer and duration of the infection. In small early lesions removal of tissue for biopsy is likely to be painful and is therefore inadvisable. Fortunately, in these cases the diagnosis by culture or smear is most likely to be successful, since there is usually little secondary bacterial invasion. In more advanced lesions biopsy is

feasible and efficient, and in these cases secondary contamination impairs the efficiency of culture and smear diagnosis.

In patients who exhibit inguinal adenopathy without primary genital lesions, a differential diagnosis between chancroid and lymphogranuloma venereum may be impossible. Biopsy is not applicable and, as shown in the foregoing section, cultural demonstration of the Ducrey bacillus often fails. Even when laboratory facilities for demonstration of the virus of lymphogranuloma venereum are available, as in this investigation, the etiologic agent may not be found. It is our belief, nevertheless, that the majority of these cases are lymphogranuloma venereum infections.

SUMMARY

An intensive study was made of a group of 125 cases suspected of being either chancroid or lymphogranuloma venereum. A positive diagnosis of chancroid was made in 60 of them. Of the various methods, biopsy appears to be the most efficient single method of diagnosis and can be depended on to give a diagnosis in over 90 per cent of the cases in which it is applicable. Its use

Ducrey bacilli in a smear of a primary genital lesion. Methylene blue stain. Magnification 1,100 diameters.

is limited to cases in which there are primary genital lesions. The removal of tissue for biopsy is in most instances a simple procedure, well suited to outpatient work. It is undesirable, however, in patients with small lesions because of the pain involved.

Cultural demonstration of the Ducrey bacillus can be accomplished in at least 75 per cent of all cases. The technic is not difficult and can be carried out by a competent technician. Culture is less likely to be successful in advanced lesions which are heavily contaminated with other bacteria. It is the only means of obtaining a positive diagnosis in patients with buboes but without primary lesions.

Diagnosis by direct smears of genital lesions is possible in approximately 50 per cent of cases. This method has the advantage of simplicity and immediate diagnosis. Unfortunately, it is likely to be useless in advanced lesions, in which there is a heavy growth of other bacteria.

Autoinoculation has several disadvantages and does not take with sufficient frequency to make it of value in routine work.

The skin test for chancroid should never be relied on as the sole method of diagnosis, although it may

be of limited value as an adjuvant to other procedures. In this group of 60 proved cases of chancroid, positive skin tests were found in only 46 cases (77 per cent). A further disadvantage lies in the fact that a positive skin reaction persists for many years after an infection and therefore may not be significant in reference to the present illness.

The diagnosis of chancroid can in the majority of cases be established by suitable laboratory procedures.

ADDENDUM

After this paper was submitted for publication, a relevant report on chancroid was published.¹¹ In this study Strakosch and his associates based the diagnosis of chancroid on the history and clinical manifestations. Among 370 cases so diagnosed they obtained positive skin tests in 70 per cent, positive cultures in 59 per cent and positive smears in 43 per cent. They did not do autoinoculations or biopsies.

ELECTROENCEPHALOGRAPHIC FINDINGS IN CENTRAL NERVOUS SYSTEM SYPHILIS

BEFORE AND AFTER TREATMENT WITH PENICILLIN

DURHAM, N. C.

Several authors¹ have published reports on the cerebral electroactivity of patients with syphilis of the central nervous system. They agree that no correlation exists between the degree of abnormality of the electroencephalographic pattern and the type, the severity or the duration of the disorder. In the majority of the cases a definitely but nonspecifically abnormal electroencephalogram, or an electroencephalogram on the borderline between normal and abnormal, is found. However, enough patients with various types of neurosyphilitic disorders present electroencephalographic records "within normal limits" to detach from this procedure any immediate diagnostic significance.

After fever treatment has been completed, the abnormal cerebral electroactivity of neurosyphilitic patients often returns to normal or at least improves greatly. The changes of a previously abnormal pattern to normal seem to be correlated with the therapeutic success. Patients whose pathologic process is arrested by the

fever but who retain residual symptomatology also retain many of the electroencephalographic abnormalities. Patients who recover without easily demonstrable signs present electroencephalograms with essentially normal qualities. Thus, although the presence in the electroencephalogram of moderate or pronounced abnormal features possesses no specific value for the initial diagnosis or prognosis of neurosyphilis, the change of the previously abnormal pattern can be used to advantage to determine the effect of antisyphilitic treatment in some instances.

To determine whether treatment with penicillin has any influence on the cerebral electroactivity, patients suffering with neurosyphilis and receiving treatment with penicillin in Duke Hospital were given electroencephalograms before and directly after treatment with this therapeutic agent. Many of the patients were reexamined at intervals after their discharge from the hospital.

The records of 38 patients are included in this study. Of these, 26 had dementia paralytica, 7 patients dementia paralytica with tabes, 1 tabes dorsalis, 1 meningovascular syphilis and 3 asymptomatic neurosyphilis.

The electroencephalograms were obtained with the standard method now employed in many laboratories. Silver disk electrodes were placed over the anterior frontal region, the posterior frontal region, the parietal region and the occipital region, on both sides, 2 to 4 cm. from the midline. These were connected with amplifiers (electroencephalographs) built by Mr. A. M. Grass. Six monopolar tracings or six dipolar tracings in different relative arrangements were recorded simultaneously. If cooperation could be obtained, the patient was asked in each case to overventilate for five minutes.

The records are classified into eight categories: 1. Regular rhythmic-repetitive activity; stable to over-ventilation. 2. "Within normal limits," i. e., a pattern showing normal amplitude with some irregularity of form and occasional sudden changes of frequency; stable to overventilation. 3. "Within normal limits" during the resting state but during overventilation showing occasional bursts of large waves of abnormal form and of shifting frequency. 4. "Within normal limits" during the resting state but affected by five minutes of overventilation to the point of complete disorganization of the pattern lasting for more than thirty seconds after the end of the procedure. 5. During rest a pattern consistently irregular with unstable and frequently enlarged amplitude, with shifting frequency but without further pronounced disorganization during and after five minutes of overventilation. 6. Severely irregular pattern during rest, with further pronounced disorganization during and after overventilation but still with occasional vestiges of relatively organized activity. 7. Continued cerebral dysrhythmia without any trace of "normal" pattern, characterized by large slow and fast waves of consistently erratic form. 8. Focal disturbance of abnormal hemispheric asymmetry.

When classified in this manner twelve electroencephalograms fell within groups 1 to 4 inclusive while twenty-six records showed definite abnormalities of varying degrees. In agreement with previous reports, no correlation existed between the severity of the clinical manifestations and the measure of electroencephalographic abnormality. However, without knowing the clinical history it was possible, because of certain electroencephalographic patterns, to divide the patients roughly into two groups. In the 34 patients with

Studies in

encephalitic involvement (dementia paralytica, meningovascular syphilis and dementia paralytica with tabes) all but 3 showed moderate to decidedly abnormal electroencephalograms. The 1 patient with meningovascular syphilis showed unilateral abnormal electroactivity. The 4 patients without encephalitic involvement (tabes dorsalis and asymptomatic neurosyphilis) showed essentially normal electroencephalographic patterns.

Immediately after treatment with 4,000,000 units of penicillin, 50,000 units being given intramuscularly every three hours for eighty consecutive injections, twenty-four records alined themselves within groups 1 to 4 and only fourteen tracings remained with definitely abnormal cerebral electroactivity. However, before treatment group 7 contained eleven records while after treatment this most severely disturbed electroactivity was found in only 1 patient, and this patient had a severe clinical Herxheimer reaction.

The following case report may serve as an illustration of a patient with dementia paralytica:

D. P. D., a white man aged 33, single, developed a penile sore in 1938 and from October 1940 to November 1944 received a total of 54 injections of bismuth, 54 injections of neoarsphenamine and 74 injections of oxophenarsine hydrochloride (mapharsen). In spite of this antisyphilitic therapy there had been a progressive loss of memory, loss of judgment, incoherence of speech, severe headache and inability to take care of his own personal needs, such as shaving and dressing. This finally progressed to incontinence of feces and urine.

Examination revealed that the superficial and deep reflexes were equal, active and physiologic. Plantar response was extensor bilaterally. The Romberg test was negative. The Hoffmann test was positive bilaterally. Speech was slow and slurred, and the patient could not enunciate words or phrases. His memory was very poor. There was an inability to obey simple orders, and as a result visual field examination and sensory examinations were impossible. Blood serologic tests for syphilis were consistently positive.

The tracing shows the electroencephalograms of the patient before treatment, immediately after treatment with penicillin and about two months later. A normal electroencephalogram is reproduced for comparison.

Clinically after treatment with penicillin the patient showed much improvement, which has persisted. When seen on April 10, 1945 he was holding down a fairly responsible job in a bakery.

In some cases the clinical results were not necessarily manifested in their electroencephalographic findings. Cases with pronounced clinical improvement and con-

processes are apparently permanently reversible. In other cases irritation due to scarring or local intermittent anoxia may well prevent the cerebral electroactivity from reverting to regularity. Ross² has recently shown that months after clinical recovery patients with non-syphilitic encephalitis and meningoencephalitis have

Tracings before treatment, immediately after treatment with penicillin and about two months later, contrasted with a normal encephalogram.

electroencephalograms that vary in the regularity or irregularity of pattern independently of the clinical picture. It should also be borne in mind that unquestionably abnormal electroencephalograms are found in a considerable percentage of the general population although these persons may have no subjective complaints, and neurologic and psychiatric examinations reveal no abnormal findings. Mental status and brain-wave pattern, at least at the level of today's interpretation, are incommensurable.

SUMMARY

1. The electroencephalograms of 38 patients suffering from neurosyphilis were studied before and after penicillin treatment.

2. In agreement with previous reports by other authors, no correlation is found between the severity of the neurosyphilitic disorder and the presence or absence of electroencephalographic abnormalities.

3. After penicillin treatment (4 million units within ten days) many formerly abnormal electroencephalograms became normal and most of the remaining records show varying degrees of improvement. No invariable correlation exists between the clinical results of the treatment and the electroencephalographic changes.

4. The abnormal electroencephalograms are interpreted as the consequence of local cerebral anoxia and of generalized or localized cerebral inflammation. Many of these abnormalities are apparently reversible.

5. The presence of abnormal cerebral electroactivity seems to indicate definite encephalitic involvement.

6. Our findings indicate that the electroencephalogram can often be used as a valuable adjunct in determining the effect of penicillin treatment in central nervous system syphilis.

MEDICAL CORPS, ARMY OF THE UNITED STATES

Of various methods described for prolonging the action of penicillin by delaying its absorption or excretion,¹ one of the most promising appears to be the intramuscular injection of penicillin-beeswax-peanut oil mixtures. First described by Romansky and Rittman,² this method is an adaptation of the technic of Code and his associates,³ who obtained extended prolongation of the action of histamine, desoxycorticosterone acetate and heparin by mixing them with various oils and beeswax. In the original communications of Romansky and Rittman² it was noted that assayable levels of penicillin could be maintained in the blood stream for seven to ten hours following single intramuscular injections of penicillin-beeswax-peanut oil mixtures. Favorable clinical results have since been reported in the treatment of gonococcic urethritis⁴ and pneumococcic pneumonia.⁵

During the past nine months mixtures containing various concentrations of penicillin, beeswax and peanut oil have been prepared and investigated in this hospital to determine which would produce the greatest prolongation of assayable blood levels and the most favorable clinical results. Detailed descriptions of these studies, which form the background for the present report, will be presented elsewhere.⁶

Factors of importance in the preparation of penicillin-beeswax-peanut oil mixture may be mentioned briefly. The peanut oil and beeswax should be of the highest

purity; totally unsatisfactory mixtures have resulted from the use of peanut oil with a high moisture content.⁷ With the original handshaken mixtures of Romansky and Rittman, calcium penicillin was considered superior to the sodium salt because it was less hygroscopic and produced finer suspensions. However, the somewhat greater attraction of sodium penicillin for water has been found to be of no consequence if the peanut oil and beeswax are added quickly to the dried powder, and it has been further found that, if a mechanical blender is used for mixing, equally fine suspensions can be obtained with both sodium and calcium penicillin.⁷ No significant differences in the duration of blood levels or in clinical results have been found between the sodium and calcium salts when the mixtures were prepared in this manner.⁸ Concentrations of beeswax varying from 4 to 12 per cent produced essentially the same degree of prolongation of assayable blood levels, but the lower concentrations may be considered preferable since mixtures containing only 4 to 6 per cent beeswax are less viscid and contain smaller amounts of foreign material.⁷ It has been recently pointed out by Romansky that the higher the concentration of penicillin per unit volume the greater the prolongation of measurable blood levels.⁹

Penicillin-beeswax-peanut oil mixtures are now being prepared by several commercial companies for experimental study and will soon be available for general use. One such preparation containing 4.8 per cent beeswax and 300,000 units of calcium penicillin per cubic centimeter is under investigation in this hospital at the present time. Our purpose in this report is to present data concerning the absorption and excretion of penicillin following the administration of this preparation to patients with syphilis and with acute gonococcic urethritis. The relation of these observations to dosage and mode of administration of penicillin-beeswax-peanut oil mixtures for therapy will be considered.

METHODS AND MATERIALS

The penicillin-beeswax-peanut oil mixture was very viscid, even after being warmed in the incubator (37 C.) for thirty to sixty minutes. Into a 5 cc. Luer-Lok syringe 1.15 cc. was withdrawn, the extra 0.15 cc. being added to allow for the amount lost in the needle during injection. A number 20 gage needle, 1½ inches in length, was used for the actual injection, and considerable pressure was required on the plunger to force the thick material into the tissues. Injections were made into the gluteal or deltoid muscles and into the subcutaneous tissue overlying the insertion of the deltoid muscle.

Seventy-nine men with gonococcic urethritis received single intramuscular or subcutaneous injections of 300,000 units (1 cc.) of the penicillin-beeswax-peanut oil mixture. Blood was obtained for assay one-half, one, four, eight, twelve, sixteen, twenty, twenty-four and twenty-eight hours after the injection, and urine was collected in twelve hour periods for from forty-eight to seventy-two hours. Follow-up clinical observations and urine cultures were performed at intervals for a minimum of twenty-one days.

Thirty-five men with primary or secondary syphilis received 300,000 units (1 cc.) of the mixture once daily

From the Medical Service, ASF Regional Station Hospital, Fort Bragg, North Carolina, and the Commission on Acute Respiratory Diseases.

Technical assistance in the performance of penicillin assays was given by Mrs. Mary S. Watson, Mrs. Lenore H. Freyer and T/5 Jewel M. Patton.

Dr. Rammelkamp is a member of the Commission on Acute Respiratory Diseases, Board for the Investigation and Control of Influenza and Other Epidemic Diseases in the Army, Preventive Medicine Service, Office of the Surgeon General, United States Army, Washington, D. C.

for eight injections, a total of 2,400,000 units in eight days. Blood was obtained for assay twenty-four hours after each injection, just prior to the next injection.

Penicillin assays were performed by the Kirby-Rantz modification of the Rammelkamp serial dilution technic.¹⁰ Since there are differences in the standardization of various assay procedures,¹¹ it may be stated that growth of the hemolytic streptococcus (number 98) used for the present tests was completely inhibited by 0.02 unit of penicillin per cubic centimeter. By this method the smallest amount of penicillin measurable in the blood serum (0.5 cc. of undiluted serum plus 0.5 cc. of inoculum containing 1,000 to 5,000 organisms per cubic centimeter) was 0.04 unit per cubic centimeter. This value, 0.04 unit per cubic centimeter, represents the smallest concentration of penicillin measurable in the blood by any of the methods available at present, although with other methods of standardization it may be referred to as 0.02 unit per cubic centimeter or even as a "trace" of penicillin.

TOXICITY

Moderate soreness was noted at the site of injection in almost every instance for from twenty-four to forty-eight hours and was less severe following subcutaneous than following intramuscular injections. Except that it persisted for nine or ten days, the local discomfort was no more severe in the patients receiving multiple injections than in those who received a single treatment. Aside from the local soreness the only toxic manifestation noted was generalized urticaria, which appeared three days after the completion of treatment in two and four days after treatment in 1 of the 35 patients treated for syphilis. It is especially to be noted that with the subcutaneous route no induration, nodule formation or sterile abscesses occurred.

RESULTS

Intramuscular Route.—Results of assays of the blood in 54 patients with acute gonococcal urethritis treated with single intramuscular injections of the penicillin-beeswax-peanut oil mixture are presented in table 1. For convenience, the cases are arranged according to the total duration of assayable levels in the blood serum.

The most striking observation was the variability in absorption of penicillin from the muscle, as reflected by the presence of penicillin in the blood stream. The duration of assayable levels varied from four to twenty-eight hours. In 1 patient the duration was four hours, and in another penicillin was present in measurable quantities on only one occasion, at sixteen hours. In 14 (26 per cent) of the patients an assayable level was present for eight hours and in 22 (41 per cent) for twelve hours. In 37, or 69 per cent, of the patients, then, assayable levels of penicillin were obtained for no longer than twelve hours.

Of the other 17 patients, 6 had measurable concentrations for sixteen hours, 8 for twenty hours, 2 for twenty-four hours and 1 for twenty-eight hours. In 9 of the 17, however, there were one or more occasions on which assayable levels were not present. In case 47, for example, assayable levels were present at one-half, one, four, eight and twenty hours but not at twelve and sixteen hours. Of the 8 cases with levels persisting for twenty hours, 4 showed this irregularity, and of the

3 persisting for more than twenty hours it was present in every instance. By contrast, in the patients in whom penicillin was present in the blood for only twelve hours this irregularity occurred only once (patient 32). Of the whole series of 54 patients, the irregularity was present in 10, or 18.5 per cent.

The explanation of this irregularity of absorption is not clear, but it was thought that it might be related

to muscular activity of the patient. It seemed possible that an absence of measurable levels at twelve and sixteen hours might occur while the patient was in bed asleep and that muscular activity during the daytime might cause enough gentle massage at the local site to produce measurable levels at eight hours and again at twenty hours. Consequently the data were analyzed from this standpoint. In all 54 patients the injections were made at 9 a. m., and the patients went to bed after the twelve hour blood was obtained. The irregularity, i. e., an absence of penicillin on one or more occasions followed by a measurable level, occurred in

10. Kirby, W. M. M., and Rantz, L. A.: Methods of Measuring Penicillin Concentrations in Body Fluids. *J. Bact.* 48: 603 (Nov.) 1944.

10 patients on twenty occasions, as follows: one occurred one-half hour after the injection, one at one hour, one at four hours, two at eight hours, six at twelve hours, six at sixteen hours, two at twenty hours and one at twenty-four hours. Thus, an absence of assayable levels occurred with roughly equal frequency during the day-

time and at night. Another factor to be considered is that a fairly large portion of the penicillin injected was absorbed during the first twelve hours and that therefore absorption of the relatively small amount of penicillin remaining in the depot in the tissues could be expected to occur much more irregularly during the second twelve hours. To settle finally the influence of activity it will be necessary to study a group of patients in which the mixture is injected shortly before bedtime and to determine the frequency of irregularity during the night and the next day.

TABLE 3—*Assays of Blood (Units of Penicillin per Cubic Centimeter) Obtained Twenty-Four Hours After Each Intramuscular Injection of 300,000 Units (1 Cc.) of the Penicillin-Beeswax-Peanut Oil Mixture in Patients Who Received 300,000 Units Daily for Eight Days*

Thirteen patients were studied, but only the 15 in whom measurable concentrations of penicillin were present on one or more occasions are included in the table

In 13 of the 54 patients in whom the mixture was injected into the deltoid muscle there was no greater prolongation of action, and variability was as frequent as in those who received treatment in the gluteal muscles. Only 3 had measurable levels for more than twelve hours, and in 3 there was an absence of detectable quantities of penicillin on one or more occasions.

The height of the blood concentrations varied from 0.04 to 2.0 units per cubic centimeter. Of a total of 256 levels, 208, or 81.2 per cent, were 0.10 unit per cubic centimeter or higher, and the remainder, forty-eight, or 18.8 per cent, varied from 0.04 to 0.1 unit per cubic centimeter.

Urinary excretion of penicillin in 15 of the 54 patients is presented in table 2. The amount recovered in from forty-eight to seventy-two hours varied from 68,000 to 150,000 units. During the first twelve hours excretion varied from 54,000 to 140,000 units and during the second twelve hours from 8,000 to 79,000 units. The amounts excreted after twenty-four hours were small, declining to only a few hundred units from the sixtieth to the seventy-second hour.

In 35 patients treated for syphilis with eight daily intramuscular injections of 1 cc. (300,000 units) of the mixture, blood was obtained for assay twenty-

four hours after each injection on 275 occasions. Of these, assayable levels were present in 20 specimens, or approximately 7 per cent of the total. The results in the patients in whom measurable levels were present are shown in table 3. Penicillin was not found in the blood any more frequently as treatment progressed; i. e., there was no evidence of significant cumulation. This is further borne out by the close agreement of the 7 per cent of twenty-four hour levels among the syphilitic patients, and the 5.5 per cent (3 of 54 patients) noted in the patients who received a single intramuscular injection for the treatment of gonococcal urethritis.

SUBCUTANEOUS ROUTE

Results of assays of the blood serum in 25 patients who received 1 cc. of the mixture subcutaneously are presented in table 4. Prolongation of measurable concentrations of penicillin in the serum was much more satisfactory than with the intramuscular injections. In every instance penicillin was detected in the blood for at least sixteen hours, and in 16, or 64 per cent, of the cases assayable levels were present for twenty hours or more. Of 156 levels, 119, or 76.3 per cent,

were 0.1 unit per cubic centimeter or higher, and of the remainder 37, or 23.7 per cent, varied from 0.04 to 0.1 unit per cubic centimeter. As with the intramuscular injections, instances in which penicillin could not be detected occurred frequently. The urinary excretion confirmed the evidence of superiority of the

TABLE 5.—Urinary Excretion of Penicillin (Units $\times 1,000$) Following Single Subcutaneous Injections of 300,000 Units (1 Cc.) of the Penicillin-Beeswax-Peanut Oil Mixture

subcutaneous over the intramuscular route (table 5). Less penicillin, on the average, was excreted during the first twelve hours and more during the second twelve hours following subcutaneous injections.

Typical curves of blood and urinary levels with 300,000 units of penicillin in saline solution (37,500 units every three hours for eight doses), and with 300,000 units (1 cc.) of the penicillin-beeswax-peanut oil mixture injected intramuscularly and subcutaneously, are presented in the chart for purposes of comparison.

COMMENT

The present studies indicate that penicillin-beeswax-peanut oil mixtures provide an effective and safe method of prolonging the action of penicillin in the body. Aside from soreness at the site of injection, the only toxic manifestation noted was generalized urticaria, which occurred in 3 of the 40 patients treated for early syphilis with eight daily injections. It is not known as yet whether these reactions represent a sensitivity to beeswax, peanut oil or penicillin.

One of the most striking observations was the variability of absorption and excretion of penicillin following intramuscular injections of the penicillin-beeswax-peanut oil mixture. The location of the injected material in relation to the muscle tissue and fascial planes was probably the most important single factor responsible for this variability. When surrounded by highly vascular muscle tissue, release of penicillin from the oily, waxy mixture occurs rapidly, whereas when it is located between the relatively avascular fascial spaces absorption is slow and irregular. Since the mixture was probably never located in exactly the same place in different patients, it is not surprising that variability should occur. Of importance in this connection is the fact that in order to maintain minimal assayable concentrations of penicillin in the blood stream there must be continuous absorption from the muscle of a relatively large amount of penicillin (at least 2,500 units per hour).¹² Other factors, such as the activity of the patient (sleeping or walking) and the muscle employed (deltoid or gluteal) seemed to have little effect on the rate of absorption. The factor of activity needs further study, however, especially from the standpoint of administering the injection in the evening rather than in the morning.

Ideally, it should be possible to administer a whole day's supply of penicillin in a single injection of a beeswax-peanut oil mixture, with the maintenance of effective therapeutic concentrations in the blood stream for a period of twenty-four hours. Unfortunately, it is evident from the present studies that this is not possible with 300,000 units, and from this standpoint the injection of the mixture is a relatively inefficient method of administration. As indicated in the chart, a single intramuscular injection of 300,000 units of penicillin in beeswax-peanut oil produces in most instances a measurable level of penicillin for only twelve hours, whereas with 300,000 units of penicillin in saline solution given in divided doses of 37,500 units every three hours assayable levels are maintained almost continuously for a period of twenty-four hours. This relative inefficiency is partly due to the fact that with the mixtures penicillin is gradually absorbed from the depot in the muscle for a period of several days. After twenty-four hours, however, and indeed in most instances after twelve hours, the amounts which appear in the urine are too small to be indicative of the presence of therapeutic concentrations in the blood and tissues. Even when the mixtures are injected daily for several days, the amounts of penicillin being slowly absorbed from several depots are too small to produce a significant cumulative action. This was well illustrated in the patients with syphilis, in whom assayable levels were present no more frequently following several doses than after a single injection.

Typical blood levels and urinary excretion in patients receiving 300,000 units of penicillin in saline solution (37,500 units every three hours for eight doses) and with 300,000 units (1 cc.) of the penicillin-beeswax-peanut oil mixture injected intramuscularly and subcutaneously.

Evaluation of these results in terms of clinical therapy is difficult, since the amount of penicillin necessary to bring about a cure in various types of infections is not definitely established. It would appear, however, that since the penicillin-beeswax-peanut oil mixture under investigation produced assayable concentrations of penicillin for only twelve hours in most instances, intra-

12. Rantz, L. A., and Kirby, W. M. M.: The Absorption and Excretion of Penicillin Following Continuous Intravenous and Subcutaneous Administration, *J. Clin. Investigation* 23: 789 (Sept.) 1944

muscular injections of the mixture should be made twice a day for the treatment of infections in which it is desirable to maintain therapeutic concentrations of penicillin throughout the duration of therapy. Examples are severe infections with bacteremia, especially those caused by staphylococci; subacute bacterial endocarditis, and possibly syphilis. The necessity of injecting 600,000 units of penicillin to obtain assayable levels in the blood stream for twenty-four hours again emphasizes the fact that the convenience of fewer injections is achieved only at the sacrifice of fairly large amounts of penicillin. This is further borne out by the fact that 300,000 units of penicillin in saline solution given in a twenty-four hour period (37,500 units every three hours) is a larger dose than is usually administered even in the treatment of the most severe infections.

Clinical results so far obtained are in agreement with the evidence indicating that larger amounts of penicillin are necessary when penicillin-beeswax-peanut oil mixtures are employed. Relapses have been noted in cases of pneumococcal pneumonia treated with 400,000 units of penicillin in beeswax-peanut oil (100,000 units daily), while in a control series no failures occurred with a total dose of only 120,000 units of penicillin in saline solution given in divided doses.⁵ In gonococcal urethritis a single injection of 300,000 units of penicillin-beeswax-peanut oil produced results no better than those obtained with 100,000 units of penicillin in saline solution (20,000 units every three hours for five doses).¹³ In the present study, three failures have occurred among 40 patients with gonococcal urethritis followed clinically and bacteriologically for a period of twenty-one days. Similarly, two mucocutaneous and serologic relapses have occurred among 35 patients treated for syphilis and followed for a period of eight weeks or more. A larger number of patients and a longer period of follow-up are obviously necessary before these figures will become statistically significant. In general, however, it appears that in order to obtain the best results in severe infections with intramuscular injections of penicillin-beeswax-peanut oil mixtures it is desirable to administer 300,000 units twice daily. With milder infections one injection a day will probably be adequate in many instances.

From the standpoint of prolongation of blood levels and uniformity of absorption, results obtained after subcutaneous administration of the penicillin-beeswax-peanut oil mixture were superior to those following intramuscular injections. The mixture was injected into the subcutaneous tissue directly over the tendinous insertion of the deltoid muscle, since at this point the possibility of introducing some of the material into the muscle was minimized. The presence of fewer and smaller blood vessels in the subcutaneous tissue probably accounts for the slower, more uniform absorption from this site. Since in approximately two thirds of the patients penicillin was present in the blood for a period of twenty hours or more, the likelihood of a single injection daily being adequate for most infections would appear to be much greater than with intramuscular injections. The subcutaneous route has been employed in only 25 cases, and the period of follow-up has not been completed; therefore, clinical results are not yet available.

13. Leifer, W.; Martin, S. P., and Kirby, W. M. M.: *The Treatment of Gonococcal Urethritis with Single Injections of Penicillin-Beeswax-Peanut Oil Mixtures*, New England J. Med., to be published.

SUMMARY AND CONCLUSIONS

1. The absorption and excretion of penicillin was studied following 359 intramuscular and subcutaneous injections of a commercially prepared penicillin-beeswax-peanut oil mixture containing 4.8 per cent beeswax and 300,000 units of penicillin per cubic centimeter.

2. There was wide variability of absorption and excretion of penicillin. In 54 patients with acute gonococcal urethritis who received single intramuscular injections of 300,000 units (1 cc.) of the mixture the total duration of assayable levels of penicillin in the blood stream varied from four to twenty-eight hours. In 37 (69 per cent) of the patients, levels were present for no longer than twelve hours, and in the other 17 (31 per cent), in whom levels were present for sixteen to twenty-eight hours, irregularity of absorption during the second twelve hours was noted in 9; i. e., there were one or more occasions on which assayable levels were not present.

3. Excretion of penicillin in the urine declined rapidly after the first twelve hours, but small amounts could be detected for seventy-two hours or more.

4. In 35 patients treated for syphilis with intramuscular injections of 300,000 units (1 cc.) of the mixture daily for eight days, assayable levels of penicillin were present twenty-four hours after each injection on 20 of 275 occasions, or approximately 7 per cent. There was no evidence of significant cumulation; i. e., assayable levels were present at twenty-four hours no more frequently following several doses than after a single injection.

5. Results with subcutaneous administration in 25 patients were superior to those following intramuscular injections, both in uniformity of absorption and in prolongation of blood levels. In approximately two thirds of the patients penicillin was present in the blood in detectable quantities for twenty hours or more.

6. From the preliminary clinical results it is concluded that, although larger amounts of penicillin are required than with penicillin in saline solution, penicillin-beeswax-peanut oil mixtures provide an effective and apparently safe method of prolonging the action of penicillin in the body.

ADDENDUM.—Since the completion of this manuscript it has been found that in most patients assayable levels of penicillin are present in the blood for twenty-four hours or more following single subcutaneous injections of 600,000 units (2 cc.) of the penicillin-beeswax-peanut oil mixture.

Inebriety and Crime.—An investigation was undertaken of 3,135 offenders committed to Sing Sing Prison in the two year period 1938 to 1940. The prisoners were classified as inebriates and noninebriates. The classification "inebriate" was based on statements by impartial observers, or admissions to a general hospital for an alcoholic disease, or admission to a state hospital for an alcoholic mental disorder. Of 3,135 prisoners 697, or 22 per cent, were found to be inebriates. In the first year of the period the proportion of inebriates was around 24 per cent and in the second year around 21 per cent. Allowing for random variations, one may say roughly that in a prison population such as that of Sing Sing the incidence of inebriety would be around 25 per cent. On the basis of proper standards one thus arrives at a much lower estimate of 60 per cent based on the indiscriminate use of data.—Banay, Ralph S., in *Alcohol, Science and Society*, New Haven, Quarterly Journal of Studies on Alcohol, 1945.

Special Article

MEDICAL CARE FOR THE AMERICAN PEOPLE

LOUIS H. BAUER, M.D.

Member, Board of Trustees, American Medical Association
HEMPSTEAD, N. Y.

We are concerned with a problem on which there are sharp differences of opinion. In fact, were there not these differences of opinion there would be no problem.

As to the ultimate aim we are all agreed. I believe no one can quarrel with the platform of the American Medical Association, adopted in June 1944, which calls for "availability of medical care of a high quality to every person in the United States." The differences of opinion arise as to how this aim is to be achieved.

As doctors we see the problem in a way no one else can possibly see it. It pertains to our daily work and we are naturally closer to it than any one else. One does not consult a doctor if one wishes to draw up a will. One goes to a lawyer. Neither does one consult a lawyer if one wishes to build a house. One goes to an architect. Yet there are many who think it is not necessary to consult the doctors on any problems related to medical care but that legislators, those engaged in social welfare and other laymen can draw up a complete program, have it adopted and then expect the doctors to make it work. It should be borne in mind that, no matter what system is eventually evolved in this country for delivering medical care, the doctor is the one who is going to have to deliver it. It cannot possibly be delivered by a "social lifter." Hence it would be better for all concerned if the plan adopted is one which will enlist the cooperation and enthusiasm of the medical profession.

Another point usually lost sight of is that the mere delivery of a quantity of medical care is not solving the problem. The homeopathic precept that the more a thing is diluted the greater its effectiveness went into the discard long ago. What we want is not just more medical care but more medical care of a high quality.

The answer to any complex problem is usually not simple but also complex. So, in our problem of medical care, the answer is not a single one but a multiple one. Yet the Social Security Board and Senators Wagner and Murray and Congressman Dingell refuse to admit there is any possible answer but the single one of a national compulsory sickness insurance, regardless of the fact that nowhere has it been as satisfactory as our own system of private medical care.

A careful analysis of the situation would seem to indicate that there are certain elemental factors which are responsible for our problem. These factors are (1) improper distribution of doctors, (2) lack of proper diagnostic facilities in certain areas, (3) the costs of illness—particularly so-called catastrophic illness—and (4) a general economic factor. These factors are closely related and cannot be considered separately. Why are certain areas devoid or short of doctors? There are two reasons. One is that certain areas are so sparsely settled that there is no attraction for a doctor, not

only because he will have insufficient patients, but because there are no educational or social facilities for him to bring up his children. The other is really the second factor (namely, the lack of proper diagnostic facilities) so that he cannot practice good medicine. In the latter case he either leaves and goes elsewhere or else he does what to my mind is worse, he stays and practices poor medicine. With further reference to the lack of diagnostic facilities, this lack is usually because the community by itself cannot support the necessary facilities.

The third factor, the costs of illness, again is tied up partially with the second: availability or nonavailability of proper diagnostic facilities. The high cost of illness is not in ordinary intercurrent illness but in the cost of diagnosis in the more complicated illnesses, in hospitalization and in private nursing care. Also in sparsely settled areas in long distances a doctor may have to go increase the cost of his services. Still another important reason is the cost of care of the chronic invalid.

The fourth factor—the general economic one—is the matter of housing, clothing, nutrition and sanitation. This is a social problem of the community and not a medical problem, although the neglect of it results in an increase in the prevalence of disease and the necessity for medical care. The solution, however, is not the pouring in of medical care but preventing the necessity for it.

With this as a general background, let us now see how the American Medical Association proposes to solve this problem. On June 22, 1945 the Board of Trustees and the Council on Medical Service and Public Relations of the Association adopted jointly a fourteen point constructive Program for Medical Care.

This program is as follows:

Preamble

The physicians of the United States are interested in extending to all people in all communities the best possible medical care. The Constitution of the United States, the Bill of Rights and the "American Way of Life" are diametrically opposed to regimentation or any form of totalitarianism. According to available evidence in surveys, most of the American people are not interested in testing in the United States experiments in medical care which have already failed in regimented countries.

The physicians of the United States, through the American Medical Association, have stressed repeatedly the necessity for extending to all corners of this great country the availability of aids for diagnosis and treatment, so that dependency will be minimized and independence will be stimulated. American private enterprise has won and is winning the greatest war in the world's history. Private enterprise and initiative manifested through research may conquer cancer, arthritis and other as yet unconquered scourges of humankind. Science, as history well demonstrates, prospers best when free and unshackled.

Program

The physicians represented by the American Medical Association propose the following constructive program for the extension of improved health and medical care to all the people:

1. Sustained production leading to better living conditions with improved housing, nutrition and sanitation, which are fundamental to good health; we support progressive action toward achieving these objectives.

In this connection the American Medical Association has previously stated that "it is not in the public interest that the removal of economic barriers to medical science should be utilized as a subterfuge to overturn the whole order of medical practice. Removal of economic barriers should be an object in itself." To illustrate this point, there appeared in a popular magazine a few years ago a drawing showing a woman in a state of malnutri-

This paper, except for the paragraphs devoted to the implementation of the program, was presented before the Jackson County Health Forum, Kansas City, Mo., on Oct. 17, 1945. The interpretations of the program were endorsed by the Council on Medical Service and Public Relations on October 18. The details of implementation of the program were drafted and approved at the Conference on Public Relations held at Chicago on October 19 and 20.

tion, clad in rags, surrounded by children also undernourished, likewise clad in rags, standing before a hovel. The picture had as its topic "These people need medical care." Of course they needed medical care, but had they been properly housed, fed and clothed they probably would have needed very little. Yet this picture was used as propaganda to call for a new system of medical care, whereas the fault was not primarily medical but a social fault of their community.

Prevention of disease by inoculation and curing disease in its early stages are excellent, but it must be remembered that good living conditions, including good nutrition, housing and sanitation, are equally important. We have as a shining example of this the condition of some of our prisoners of war, who were released not only in a state of malnutrition but often afflicted with deficiency diseases such as beriberi, diseases influenced by overcrowding such as tuberculosis and diseases due to cold and damp such as arthritis and rheumatic conditions. Again, faulty sanitation may be the main factor in the spread of typhoid, overcrowding and lack of cleanliness in the spread of typhus. The mere provision of a quantity of medical care does not affect the cause of these diseases. The real cause is often economic and not medical.

The implementing of this first point must be by education of the public. There are constant attempts to overthrow the whole order of medical practice on the theory that the people in this low economic group have inadequate medical care, whereas the solution is in raising the economic level of these people.

Constant publicity is recommended on the facts of this particular problem through the American Medical Association, the state associations, the county societies and the women's auxiliaries, by addresses and articles not only in the medical journals but also in the lay press.

2. An extended program of disease prevention with the development or extension of organizations for public health service so that every part of our country will have such service, as rapidly as adequate personnel can be trained.

Not over half of the counties in the United States have a full time public health service. In some cases where a full time service does exist, it is subject to political control, there is no continuity in administration and an inefficient health department results. Now it would not be feasible for every county to have a full time health department of its own because of the expense. However, neighboring counties could form a district health department with a traveling health service and laboratory. The protection of the water, milk and food supplies, proper sewage disposal and mosquito and fly control will practically eliminate many diseases with not only no increase but an actual decrease in the amount of medical care necessary. To do this public support must be secured and in some instances funds from outside the community must be obtained. The medical profession has no objection to the use of federal funds where necessary to establish health departments but believes that the administration of these activities should be under local control, except as to meeting general high standards.

Training of public health officials is important, and when they are trained they should be adequately compensated. At present many public health officials do not receive the income of men engaged in private activities or often in other fields of government.

The implementing of this second point is by means of legislation. Such legislation should also be of interest to the American Public Health Association, the State and Territorial Health Officers Association and the U. S. Public Health Service. It is recommended that the American Medical Association sponsor a conference with these groups in an endeavor to enlist their cooperation in legislative efforts to accomplish the purpose of this item.

3. Increased hospitalization insurance on a voluntary basis.

4. The development in or extension to all localities of voluntary sickness insurance plans and provision for the extension of these plans to the needy under the principles already established by the American Medical Association.

5. The provision of hospitalization and medical care to the indigent by local authorities under voluntary hospital and sickness insurance plans.

These three may be considered together. At present over 19,000,000 people are insured under Blue Cross hospitalization plans and about an equal number are insured through their industries, although there are probably many duplications so that the total is not twice 19,000,000. This method has grown rapidly and tremendously and seems to meet the needs for hospitalization where it is in operation. It would seem, therefore, that extension of this insurance on a voluntary basis so that it is available to every one who desires it should be our aim and that every support should be given it.

Voluntary sickness plans now cover nearly 29,000,000 persons in the United States. The plans vary. Some are industrial, some are medical society sponsored and some are private insurance in commercial companies. The plans also vary as to coverage. Some give complete coverage and others give only partial coverage. Some cover only the employee and others his family as well.

Except for a few industrial plans, the idea is comparatively new. When it was started it was deemed best to begin on an experimental basis in small areas. No one knew what coverage should be given; there was no actuarial background and no one knew how either the public or the profession would react to it. Consequently, progress has been slow. Many plans were abandoned and others revised. Ideas are now crystallizing as to the best type of plan or, rather, plans, as no one plan seems to be suited to every area and every class. By that I mean that what will work in New York City will not necessarily work in Topeka, Kan. Rural and agricultural needs are different from metropolitan and industrial. However, certain elements in these plans may be workable nationally, and efforts are being made to establish national indemnity plans.

The American Medical Association would extend these voluntary plans and has approved the principle of so-called medical service plans for the medically indigent. To show how these matters progress, the original approval of voluntary medical insurance was on an indemnity basis only. Now both are approved so long as they follow certain principles.

The American Medical Association also has recommended the use of the voluntary insurance principle in the hospitalization as well as the medical care of the indigent. Public authorities could make use of these plans wherever they are available at a lower cost and with more efficient service than by extending institutions for the indigent or employing full time physicians to care for the indigent. Some of those who desire

compulsory sickness insurance say this cannot be done because the law does not permit it, but I note that they have no hesitation in urging changing of the law to permit compulsory sickness insurance, which the law does not permit now either.

Since there will be a special report on this subject, it is recommended that any decisions on this subject be integrated into the implementation of these three points of the program.

In addition, it is recommended that the medical care of veterans be integrated into these voluntary plans of hospitalization and medical care. This large group would help stabilize these plans and at the same time give the veterans free choice of physician and permit them to be cared for on a local basis without the necessity of vast extension of government institutions.

6. A survey of each state by qualified individuals and agencies to establish the need for additional medical care.

The scientific approach to the problem is to determine the needs first and then to treat specifically the needs that are so developed. It is important to have a survey in every state to find where the weakness lies—whether in the field of infant mortality, venereal disease, tuberculosis, lack of hospital beds, lack of diagnostic facilities or elsewhere—and then to take steps necessary to meet those needs.

These surveys should include every medical facility, not just certain ones, as no true picture can be obtained of any facility without considering the problem as a whole and with due reference to every factor.

These surveys should be made by the state agencies, public and private, with cooperation and approval of the state medical associations.

7. Federal aid to states where definite need is demonstrated, to be administered by the proper local agencies of the states involved with the help and advice of the medical profession.

The medical profession, under certain conditions, approves appropriations by Congress of funds for medical purposes. It feels, however, that in many instances states have sought aid and appropriations for such functions without any actual financial need on the part of the state, in order to secure such funds as might be available. Funds may be allotted when proof is given of the actual financial need by the state for prevention of disease, for promotion of health or for the care of the sick. Health is primarily a local responsibility. Physicians should be integrated into the control of all medical affairs, and the control of local projects should be local in character.

This likewise is a legislative matter and should be implemented by the American Medical Association again, in collaboration with the other agencies listed under item 2, together with the collaboration of the state medical associations.

8. Extension of information on these plans to all the people with recognition that such voluntary programs need not involve increased taxation.

One of the difficulties we encounter is that the people do not realize the vast amount of medical service now available. In every large city and in many counties and states there are extensive provisions for medical service, of which those entitled do not avail themselves. Education of the public as to what is available and how to obtain it is essential. The Medical Society of the State of New Jersey a few years ago broadcast to the public via the press, radio and public speakers that any person in the state of New Jersey who could not get medical

care should immediately contact the state society. Out of the entire population of New Jersey only 7 persons applied, and in each of these 7 cases medical care was available. They simply did not know how to obtain it.

This is again a purely educational matter, and the implementation should be through the American Medical Association, the state associations, the county societies, the woman's auxiliary and the appropriate voluntary health agencies. The bulk of the information necessary is, of course, local and hence the educational activities must be necessarily largely local.

9. A continuous survey of all voluntary plans for hospitalization and illness to determine their adequacy in meeting needs and maintaining continuous improvement in quality of medical service.

Exactly as a preliminary survey is needed to determine the areas of need, so also must there be continuous surveys of the manner in which existing provisions meet existing needs in order to permit progress. There should be continuous evaluation of medical services so that they may be kept up to the best that can be provided.

We will now consider items 10, 11, 13 and 14 together, as they are related and pertain to the emergency, the result of the war:

10. Discharge of physicians from the armed services as rapidly as is consistent with the war effort in order to facilitate redistribution and relocation of physicians in areas needing physicians.

11. Increased availability of medical education to young men and women to provide a greater number of physicians for rural areas.

13. Adoption of federal legislation to provide for adjustments in draft regulation which will permit students to prepare for and continue the study of medicine.

14. Study of postwar medical personnel requirements with special reference to the needs of the veterans' hospitals, the regular army, navy and United States Public Health Service.

Some 60,000 physicians have entered the armed forces voluntarily to do their part in the war. Discharge of these physicians as rapidly as possible is essential, to relieve areas where there is an insufficient number of physicians to care for the civilian population and to facilitate redistribution and relocation of physicians in areas requiring them. The American Medical Association has established a Bureau of Information to determine such areas of need and to facilitate relocation of physicians.

The present draft regulations ignore the necessity of providing students for necessary premedical study. The United States is the only country that has not protected the training of individuals for medicine and other sciences. Unless steps are taken to remedy this situation there will be an increasing shortage of physicians in the near future. Any legislation for compulsory military service should recognize the need for maintaining continuous training in science and particularly in the science of medicine.

Item 14 ties in with this, as there will be a greatly increased call for physicians during the next few years to meet the needs of an increased regular army, regular navy, Veterans Bureau and occupied territory. Not only shall we need more physicians, but care must be taken to see that only the physicians actually necessary are taken into the services. There are many complaints that physicians in the services are in excess of what is required and that their professional skill is not properly utilized. This may have been necessary or unavoidable in war but certainly is not in peace.

Item 11 is closely related to the three preceding items. Medical schools have suffered during the war from a lack of properly qualified persons to take the courses. The removal of premedical students from the colleges by the Selective Service System is chiefly responsible. The American Medical Association advocates every possible effort toward filling the classes of the premedical students and toward expanding medical education to meet the needs of the nation. To attract physicians to rural areas there must be adequate diagnostic facilities, and in some cases subsidies may be necessary.

To implement these items, the American Medical Association should continue its close contact with the Army and Navy and continue urging that physicians be released as rapidly as possible and, further, that the existence and functions of the Bureau of Information be steadily advertised to the men in the services.

Pressure should also be continued on the responsible authorities by both the American Medical Association and the state medical associations to effect the recommended changes in the draft regulations, and if this fails legislation should be sponsored to bring about these changes.

With reference to item 11, this is in part related to the establishment of adequate diagnostic facilities so that there will be attractions for the physician in rural areas. While the training of more physicians is necessary, this is no surety that when they are trained they will settle in rural areas. The use of grants from the various funds or subsidies by the local communities will in some cases be necessary, in addition to the setting up of proper diagnostic facilities, if the problem is to be solved. The surveys recommended in items 8 and 9 should include the needs of rural areas as to additional physicians, and investigation should be made of the most feasible method of alleviating the shortages.

12. Postponement of consideration of revolutionary changes while 60,000 medical men are in the service voluntarily and while 12,000,000 men and women are in uniform to preserve the American democratic system of government.

This, of course, refers to legislation such as the Wagner-Murray-Dingell bill. Lest there be misunderstanding, let me state at the start that this does not mean that the American Medical Association is weakening in its stand against national compulsory sickness insurance. It merely means that, with such a large proportion of doctors and the public in service and unable to give their opinions, no such revolutionary change should even come up for discussion until all the people have an opportunity to express themselves.

We are unalterably opposed to the Wagner-Murray-Dingell bill for the following reasons: It is un-American; it is inordinately expensive, involving an 8 per cent pay roll tax up to \$3,600 of income, and this probably inadequate. In fact, a recent economic survey indicates that with a national income of \$120,000,000,000 a 15 to 17 per cent tax will be necessary and even this, perhaps, inadequate. It sets up another federal bureaucracy with a lay board—the Social Security Board—at its head, to decide all medical matters, and although the administrative head is the Surgeon General, who incidentally usually is, but need not by law be, a physician, nevertheless he is an appointive, not an elective, official and he is subject to the dictates of this lay board; a third party, namely the government, is brought between the doctor and the patient, and the doctor is responsible

to that third party. The head of the government camel is thrust into the tent of medical education and medical research. While free choice of physician is provided for in the bill, this is a "come on," as it means free choice of the physician who will take part in the scheme. A poor type of medical care is encouraged—quantity without regard to quality. Inefficiency, red tape and political medicine will result. Should the bill be enacted, government control would cover not only doctors but eventually dentists, nurses, technicians, hospitals, medical and hospital supplies and equipment. Notwithstanding Senator Wagner's claim that this bill is not socialized medicine, it is just that. It is paternalistic and inevitably will lead to national socialism.

The *Saturday Evening Post* has the following to say: "One reason why the compulsory state seems to be gaining on us is defeatism among the vast majority who don't want any part of it. We have been told so often and so emphatically that collectivism is 'inevitable' that we have come to believe it, as if some strange bacterial growth were gnawing at our economic vitals and it was too late for an operation. Investigation of specific symptoms usually reveals that the only 'inevitable' feature of the march toward collectivism is the determination of the little group which wants to collectivise us."

The wording of this item is already somewhat obsolete, as there are no longer 60,000 physicians or 12,000,000 persons in the services. The number is dropping steadily. The purpose of this item originally, however, was to protect the rights of all Americans to express themselves on any revolutionary change affecting their daily lives.

It is recommended that the American Medical Association give notice that it has not only in the past, does now, but will in the future oppose any legislation which by its very nature engenders a poor type of medical care, encourages dependency or regiments either the patient or the physician.

We consider such legislation as compulsory sickness insurance, no matter how it may be dressed up, as reactionary. There have been attempts for over thirty years to bring about compulsory sickness insurance in some parts of this country and for several years nationally. All the bills introduced have the same basic faults. It is the same old specter with the addition of occasional new cosmetics in the hope that they will fool the public into thinking it is something new. It is an all or nothing program and is in the nature of a "shotgun prescription."

On the other hand, our program attacks the basic deficiencies, offers specific treatment for specific ills, is elastic and can be modified from time to time as conditions indicate.

CONCLUSION

It would be better to rearrange the order of the program so that it may be divided into four general aims.

I. Those primarily educational. This covers items 1 and 8, namely the removal of economic barriers so that a great deal of medical care will be unnecessary by eliminating its need; and extension of information to the people on services available.

In our educational program we particularly urge that state associations do their utmost to reactivate and revivify the county societies. The vast majority of these are poorly attended and the members are indifferent to the problems that beset us. No education of the public can be successful unless the profession also is fully educated.

II. Those primarily calling for positive legislation or administrative action by governmental agencies. This includes items 2, 6, 7, 9, 10, 11, 13 and 14; namely, extension of public health service for the prevention of disease; surveys to determine our needs, with these surveys continuous so that our remedies may keep pace with our necessities; the setting up of proper diagnostic facilities where lacking; federal aid where local communities cannot finance their necessary activities, but the activities to remain under local control; the readjustments in personnel requirements of the services; the necessary relocation of physicians, and necessary changes in the draft regulations.

III. Those calling for positive action but not as a rule legislative action. This includes items 3, 4 and 5; namely, extension of hospital and medical insurance on a voluntary basis, already of proved value, to cover the country; and the use of this principle in caring for the indigent.

IV. The one item calling for negative action, namely item 12. This refers to the Wagner-Murray-Dingell bill and other types of vicious legislation.

Finally, just as we have in our program recommended surveys of our medical facilities so that they may be kept up to the best possible level, so the Board of Trustees and the Council on Medical Service and Public Relations should continuously survey the constructive program for medical care and likewise keep it constantly up to date so that it will stay at least even with and, if possible, a step ahead of the needs of the public.

Clinical Notes, Suggestions and New Instruments

SUBCUTANEOUS OR EXTRAPERITONEAL GALLBLADDER

(A REPORT OF AN UNUSUAL CASE)

ROCKWOOD W. BULLARD JR., M.D., CHICAGO

Anomalies of the biliary system have frequently been reported in the past fifty years and there have been a few cases of unusual location of the gallbladder.¹ It has been found in hernial sacs, found floating on a long mesentery within the abdomen and found completely buried in the substance of the liver. There have been a few reported cases of spontaneous biliary fistula through the abdominal wall with extrusion of gallstones.

Early in 1945 at the Presbyterian Hospital of Chicago I operated on a gallbladder which lay directly beneath the skin and on top of the abdominal muscles. A search of the literature has failed to reveal a similar history and for that reason this case would seem to be unique.

The patient was a woman aged 81 who appeared in the clinic with the complaint of a painless mass in the upper right abdomen, which had grown during the previous two years. She had always been in good health and had never had indigestion, pain associated with eating, or jaundice. The mass appeared beneath her ribs two years before, gradually increasing in size and growing more rapidly in the past year.

The tumor appeared to be attached to the underlying muscle, was firm and was not tender. A preoperative diagnosis of a fascial sheath tumor was made and under local anesthesia the mass was removed.

It was lying on the internal oblique muscle and split the fibers of the external oblique. At the upper end of the mass there was a strand of fibrous tissue which split the fibers of

the internal oblique and transversalis muscles. This was found to contain a lumen, and a probe could be inserted to a depth of 3 cm. A brownish liquid appeared. This was interpreted as being a bile duct and several small stones were removed. This tumor was not contained in a hernia sac.

Fig. 1.—Subcutaneous gallbladder under right costal arch.

The tumor was then removed with a small portion of the external oblique muscle. The internal oblique and transversalis were then retracted and the peritoneum incised; a finger placed in the abdominal cavity could palpate a small, tubulized structure which was interpreted as being the cystic duct. A catheter was placed in this duct, the external oblique and skin were closed and the patient was returned to the ward.

Fig. 2.—Specimen from patient shown in figure 1 cut open, showing gallbladder containing stones.

Injection of diodrast through the tube confirmed the belief that we were dealing with the cystic duct. When it was opened, the tumor was found to contain a brown stained mucus and numerous faceted gallstones. Microscopic section of the wall of the tumor showed that we were dealing with the gallbladder.

The patient was allowed out of bed the following day, drained nothing from her tube and subsequently made an uneventful recovery.

SATURDAY, DECEMBER 1, 1945

THE PRESIDENT'S NATIONAL HEALTH PROGRAM AND THE NEW WAGNER BILL

Last week THE JOURNAL published the message sent to Congress on November 19 by President Harry S. Truman submitting a National Health Program. On the same day Senator Wagner of New York introduced for himself and Senator Murray Senate S. 1606, and Congressman Dingell introduced into the House the same version of the new Wagner-Murray-Dingell bill. Obviously a number of conferences between those interested must have preceded the coordinated action that occurred. Senator Wagner accompanied his introduction of the measure with another opening statement, a brief summary of the health provisions and a long series of questions and answers about the prepaid medical care provisions of the National Health Act of 1945. The language of the President in his message to the Congress and of Senator Wagner in his statement to the Senate and the language of the measure itself are the same trite locutions that the advocates of federal compulsory sickness insurance have used for these many years in trying to force these proposals on the American people. According to Arthur Sears Henning, "the compulsory health insurance plan is chiefly the brain-child of Isidore S. Falk, research director of the Social Security Board, and Michael M. Davis, a member of the C. I. O. Political Action Committee."

Elsewhere in this issue appears an analysis by the Bureau of Legal Medicine of the American Medical Association of the changes in the latest version of the Wagner-Murray-Dingell bill from that introduced previously. Mr. Wagner in his opening statement again informs the Senate that this bill is the result of the constructive suggestions of many outstanding medical authorities and of labor, farm, consumer and health organizations interested in improving the nation's health. Neither the President nor Mr. Wagner nor the Social Security Board made the slightest attempt to consult any representatives of the American Medical Association,

which now embraces in its membership more than 125,000 American physicians. Typical of the kind of government that the bureaucrats would force on the American people is this technic of consulting advisers who are known in advance to be in complete agreement with the persons whom they are supposed to advise and of studiously avoiding any one who might offer a contrary opinion. This is government by minority with a vengeance.

The insidious strategy that has been employed in recent years, leading toward culmination by approval of the President of the United States, is clearly apparent to those with an understanding of what has been going on. Since the time when Michael Davis and his associates engineered the formation of the Committee on the Costs of Medical Care down to the present, a gradual enlistment has been secured in behalf of socialized medicine of every agency that could be induced to combine in a movement toward socialization of the American system of government. Around their banner have rallied the members of the so-called Boas' Physicians Forum, certain doctors of philosophy in the field of economics and sociology, the socialistic element in the American Public Health Association and those employed in governmental health agencies who thirst for increased power and expansion of the bureaus that they serve. Let the people of our country realize that the movement for the placing of American medicine under the control of the federal government through a system of federal compulsory sickness insurance is the first step toward a regimentation of utilities, of industries, of finance and eventually of labor itself. This is the kind of regimentation that led to totalitarianism in Germany and the downfall of that nation. Its prime consideration is deduction from the pay of the worker and taxation of the employer so that the government does for the people most of the things that our people in the United States have been accustomed to do for themselves. The time may yet come when the American worker, as was the case with the German worker, will have more deductions from his wages than "take home" pay.

"SOCIALIZED MEDICINE" AND FREE CHOICE

In the President's message to the Congress and in the material written for Mr. Wagner by those whom he employs and consults in the preparation of his proposals, constantly reiterated is the statement that these proposals are not "socialized medicine." The first of Mr. Wagner's questions and answers is concerned with this question in semantics. Worse than socialized medicine is "state medicine." In any system of state medicine the government collects the funds available, manages the service and distributes the payments. Is not this what the Wagner-Murray-Dingell bill would accomplish? True, in the proposed legislation for a federal system of compulsory sickness insurance, patients are told that

they will have free choice of doctors; doctors are told that they will have the right to refuse any patients; but the bill provides that the Surgeon General can limit the number of patients that a physician will see, and that the Surgeon General will provide other physicians when too many patients select one or more of the physicians in a community. The measure mentions free choice of doctor for the patient, but it is free choice within limitations. It is free choice of the doctors who are willing to work under the system. It is free choice if the doctor is willing to work under a fee bill set up by the government. It is free choice if the doctor is willing to accept a payment of so much per person per year for his services. It is free choice if the doctor is willing to work as a salaried member of a group. It is free choice if the doctor is willing to abide by a majority vote of the doctors licensed to practice in his community. What kind of free choice is that?

Senator Wagner has always insisted that compulsory health insurance—really sickness insurance—is not socialized medicine. Actually the proposals involve both socialized medicine and state medicine. The American people are entitled to straightforward, honest statements from their representatives as to what such proposed measures would do to them and to their physicians. They have not had such a straightforward statement either from the President in his message or from Senator Wagner in his statement to the Congress.

THE STATISTICS

In opening his message to the Congress, President Truman referred again to the rejections of registrants under the draft and to the rejections of women who applied to the Women's Army Corps and other women's services. Every fundamental principle of the scientific interpretation of statistics has been violated by the proponents of federal compulsory sickness insurance in their utilization of these figures as propaganda for the measures they propose. The facts have been provided in several previous editorials in *THE JOURNAL*. One needs only to recognize that the standards of physical fitness for military service changed greatly from the army of preparedness to the end of the war. Men who were rejected as physically unfit for military service in the first year of war were accepted as quite fit for complete service or for limited service in the later years of the war. Furthermore, none of the proponents of this legislation have ever admitted frankly, as they should if they are interested in an honest scientific statement of the facts, that a tremendous number of those rejected as unfit could not be made more fit by any knowledge available to modern medicine today.

In his questions and answers presented to the Congress, Senator Wagner again challenges the statement

that health conditions and standards of medical service in the United States are higher than in any other large country in the world. Here are more "tricks" with words. The figures for New Zealand have often appeared better than those of our country, but New Zealand is quite different from the United States and not in any sense of the word comparable. And even if it were comparable, the statistics for New Zealand concern its white European population and carefully avoid citation of its colored and native population. As we go to press New Zealand's system of socialized medicine reportedly faces failure and bankruptcy. Mr. Wagner even challenges the figures for life expectancy in the United States. Let him consult the most recent figures prepared by the leading life insurance companies in this country, which have a financial stake in the life expectancy of the people; he will discover how far ahead the United States really is of any other country in the world with or without a national compulsory system of medical care.

FEDERAL AID FOR HOSPITALS

The President's program includes five features. First is the proposal to grant federal aid for the building of hospitals and health centers throughout the nation. Both the American Medical Association and the American Hospital Association have approved the principles of the Hill-Burton bill, which make this proposal effective. Senator Wagner in his statement to the Congress reminds us that he himself introduced a hospital construction bill in 1940. He has now eliminated from the new Wagner-Murray-Dingell bill the section in the previous draft which concerned hospital construction. This at least is fortunate for the American people because the provisions of the Hill-Burton bill, as modified by the Senate committee which conducted the hearings and which has reported the bill favorably to the Senate, are much more wise and much more scientific than the proposals of Wagner, Murray and Dingell. Under the Hill-Burton bill money will not be spent until the need is shown by a survey conducted in the individual state. Furthermore, state organizations will be developed which will have the responsibility for allocation of funds and the control of the expenditure of funds. The place of the federal government will be to act as custodian of the funds and to provide the funds when adequate evidence of their need and proper utilization is supplied. Incidentally, this measure recognizes that some areas of the country may need funds much more than do others, and beyond the ability of the individual state to match any federal appropriation.

MATERNAL AND CHILD HEALTH SERVICES

The second recommendation by President Truman is for an expansion of maternal and child health services. Apparently President Truman failed to take into account

the pending Pepper bill for maternal and child health, which was analyzed in an editorial published in *THE JOURNAL* on November 10. Senator Wagner in his statement to the Senate does recognize the existence of other proposals. The Wagner-Murray-Dingell bill would make increased grants-in-aid through the Children's Bureau to the individual states for maternal and child health and crippled children, the states developing their own plans, which, of course, would have to have the approval of the chief of the Children's Bureau. Here the grants are made variable according to the established need in the individual states. The Wagner-Murray-Dingell bill requires that the chief of the Children's Bureau enter into agreements or cooperative working arrangements with the Surgeon General of the Public Health Service to insure coordination in the administration of programs and services in this field. This at least is a recognition of the fact that federal coordination of health activities is a fundamental need in our government at this time. The Congress will soon give authority to the Chief Executive to transfer various agencies in order to secure coordinated action and to bring about unified policies. The American Medical Association has recommended again and again and again that the number one step necessary in coordination of health activities is removal of the Children's Bureau from the Department of Labor to the United States Public Health Service in the Federal Security Agency. Previous presidents have apparently been unable to accomplish this highly desirable objective. The American Medical Association favors the utilization of federal or state funds for the extension of maternal and child health services where needed.

President Truman also urges an extension of public health services throughout the United States. At present less than half the counties in the United States are provided with full time public health service. Perhaps some of our counties could never utilize a full time public health service efficiently; groups of counties could, of course, cooperate. Nevertheless the American Medical Association has been among the leaders of the nation in urging that adequate public health service be made available in every community in our country.

EDUCATION AND RESEARCH

Confusion again prevails when the proposals of the President's message and of the Wagner-Murray-Dingell bill are read in connection with the proposals of the various measures for establishing a National Science Foundation. This Mr. Wagner recognizes in his statement to the Congress; he points out that the Senate Committee on Military Affairs has before it legislation providing for the promotion of medical research and professional education. He indicates that these proposals remain in his revised National Health Act because

he wants to help promising individuals without financial means to get a medical education, and he wants to overcome "the restrictions which the medical schools apply particularly to persons of minority groups." For these purposes the sums of \$10,000,000 the first year and \$15,000,000 the second year are mentioned. Incidentally, the Senator wisely recognizes the necessity for training adequate personnel in the field of public health if progress is to be made in that field. Nevertheless the Congress would do well to place in some single agency all of the various programs allocating funds for training personnel in the field of research, medicine, the public health, the basic medical sciences and related fields of study. Scientists throughout the nation are agreed on the desirability of a National Science Foundation. Physicians favor increased research on cancer and on mental disease and indeed in every medical field in which research could be helpful. They do feel, however, that any National Science Foundation should be directed by a competent board of scientists, who could coordinate research and education. Apparently the present administration seems to prefer a National Science Foundation which would be headed by a politically appointed director. Apparently Wagner, Murray and Dingell seem to prefer a system in which the Surgeon General of the United States Public Health Service would allocate funds to medical schools, research institutions and similar agencies that meet his approval. The movies have a czar who directs and coordinates their activities in certain fields, but they can remove him when they wish to do so and they are free to resign from his support when they wish to do so. Similarly baseball has its czar. Now apparently our government wants a czar for medicine and another czar for research, but there is no way in which those who would be compelled to subscribe for the establishment of the system and for those who would be compelled to work under the system to resign. Their freedom would become a thing of the past.

Incidentally, in his statement on medical research and education, Senator Wagner has one quite revolutionary paragraph. Under the Constitution of the United States the control of medical practice is within the province of the individual states. Here is the statement of Senator Wagner:

State licensure laws are so complex, so lacking in uniformity and so obstructive of interstate mobility of qualified practitioners that some federal legislation is necessary to bring order out of this chaos. There are no medical schools in some states, and measures to remedy this defect should be considered. Finally, the discrimination which most medical schools practice against student applicants from minority groups requires congressional consideration and appropriate action.

Regardless of whether or not some of the abuses to which the Senator refers exist, the Senator finds only one possible remedy—compulsion by the federal govern-

ment and removal from the individual states of their right to control their own policies. Furthermore, has he made the slightest possible investigation to find out whether or not every state in the United States can support and operate successfully a modern medical school? Has he considered the necessity for teachers, for pupils, for patients? One is reminded of the state which built with federal funds a hospital for crippled children that exhausted the needs of a hospital for crippled children in that state within two years.

COMPENSATION FOR LOSS OF EARNINGS DUE TO SICKNESS

The fifth proposal in the President's program and in Senator Wagner's measure is compensation for loss of earnings due to sickness. The American Medical Association through its House of Delegates has consistently favored such insurance. Most strange among the changes in the present measure offered by Wagner, Murray and Dingell from their previous promulgation is the failure to indicate anywhere in the proposed measure the taxation to be provided on the worker and on the employer to provide funds for this measure. True, the President in his message mentions 4 per cent on the first \$3,600 earned by an employee, but the measure itself makes no such mention. Perhaps the mention was avoided deliberately by Senators Wagner and Murray and by Congressman Dingell so that the bill could be referred to the Senate Committee on Education and Labor, of which Senator Murray is chairman, rather than to the Senate Committee on Finance, to which the previous measure was referred. This may serve to secure hearings on the legislation and thus to keep it alive rather than to permit it to sink into the innocuous desuetude that was the fate of the previous measure.

EVILS OF COMPULSORY SICKNESS INSURANCE

Many of the answers included by Senator Wagner in the questions and answers submitted by him to the Senate are denials of the charges repeatedly made against his proposals by those who wish to see the principles of initiative, democracy and freedom maintained in American medicine. Thus he categorically denies that his measure "will destroy the private practice of medicine," that it will place the medical profession "under the direction of one man, the Surgeon General of the United States Public Health Service," that "the National Advisory Medical Policy Council will have no authority," that "the hospitalization provisions in the bill" will "destroy the voluntary hospital system," that "medical education will be controlled by the Surgeon General," that "the bill will plunge the physicians into political slavery," that "people will be obliged to take any doctor the Surgeon General tells them to," that "the Surgeon General of the Public Health Service" will

have "the power and authority to designate which doctors can be specialists." The Senator by sophistic argument and smooth phrases categorically denies all of these charges against this measure; THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION now insists that every one of these charges against the measure is valid and that the actual text of the measure itself is the proof of that validity.

No one will ever convince the physicians of the United States that the Wagner-Murray-Dingell bill is not socialized medicine. By this measure the medical profession and the sick whom they treat will be directly under political control. By this measure the great system of private hospitals and community hospitals that have grown up in our country will depend for their continued operation on funds paid to them by a federal government agency. By this measure the philanthropic efforts for the care of the sick, which have been the pride of our nation, will be forever deterred. Through this measure competent young men who would enter the medical profession will be forced to seek other fields of action still remaining under our democracy which still permit the exercise of individual initiative and freedom of thought and action. By this measure doctors in America would become clock watchers and slaves of a system. Now, if ever, those who believe in the American democracy must make their belief known to their representatives, so that the attempt to enslave medicine as first among the professions, industries or trades to be socialized will meet the ignominious defeat it deserves.

BACITRACIN, A NEW ANTIBIOTIC

In a study of the bacterial flora of contaminated wounds, Johnson and his associates¹ of the departments of surgery and biochemistry, Columbia University College of Physicians and Surgeons, found that pathogenic micro-organisms appeared at times on blood agar plates following direct plating of the injured tissues; these were not demonstrable in broth cultures made at the same time from the same material. This occurred most frequently when the broth cultures contained nonpathogenic contaminants of the *Bacillus subtilis* group. Many of these contaminants had an inhibiting action on subsequent platings with gram positive cocci, one strain being of particularly high antibiotic titer. The active principle of a cell free filtrate from this strain has been named "bacitracin" by the Columbia University investigators.

"Bacitracin" is formed by surface growth of this strain on a variety of liquid mediums but not in submerged growths, the maximum titer being reached after

1. Johnson, Ballina A.; Anker, Herbert, and McIneny, F. L.: *Science* 102: 376 (Oct. 12) 1945.

three to five days' incubation at 37 C. This antibiotic is insoluble in ether, chloroform, acetone or ethyl acetate but can be extracted from broth cultures with normal butanol. Evaporation of the butanol extract by steam distillation in vacuo results in a grayish white powder.

"Bacitracin" thus prepared is a neutral substance not precipitable by manipulating the p_H . In this it differs from other earlier antibiotics.² The substance is water soluble and coctostable. It is nonhemolytic for human or sheep erythrocytes and resists digestion with pepsin or trypsin. The substance is nontoxic on intraperitoneal or intravenous injection into laboratory animals or on subcutaneous injection into human volunteers. It is nonirritating when applied to the human conjunctiva.

A tentative standard "unit" of bacitracin was adopted by the Columbia University surgeons, an amount which diluted 1,024 times and added to 2 cc. of beef infusion broth will completely inhibit the growth of a stock culture of hemolytic streptococci. This is apparently about 500 times the Oxford unit used in standardization of penicillin. Adopting this unit, the material obtained by harvesting from a synthetic culture medium at times assays as high as 10 Columbia units per cubic centimeter (the equivalent of 5,000 Oxford units). This abundant yield would be of trade interest if the new product should be produced commercially.

The new antibiotic is active against a wide range of pathogenic micro-organisms. From 0.001 to 0.002 Columbia unit gives complete bacteriostasis with standard suspensions of pneumococci, hemolytic streptococci and *Clostridium welchi*. Slightly larger doses are required for complete inhibition of *Clostridium histolyticum*, gonococci and meningococci. *Escherichia coli* and *Proteus vulgaris* are not inhibited.

In vivo protection tests have been made on mice injected intraperitoneally with 10,000 minimum lethal doses of hemolytic streptococci. If this inoculation is followed at three hour intervals for thirty-six hours by subcutaneous injections of 1 unit of bacitracin, approximately 90 per cent of the injected mice survive. The control mortality is 100 per cent. Guinea pigs similarly injected with multilethal doses of *C. welchi* or *C. septicum* are 100 per cent protected by repeated subcutaneous injections of bacitracin.

Thus far bacitracin has been used locally to treat a number of human infections due to hemolytic streptococci and staphylococci. The results are equal to the response in similar cases to local penicillin therapy. Attempts are now being made to produce bacitracin by large scale commercial methods. If successful, the new antibiotic should be much cheaper than penicillin.

Current Comment

TREATMENT OF PEPTIC ULCER WITH AMINO ACIDS

A recent report by Co Tui and his co-workers¹ from several departments of the New York University College of Medicine presents some rather astonishing results from the treatment of patients with peptic ulcer by high amino acid feedings. Twelve patients with duodenal ulcer, 5 with combined duodenal and gastric ulcer, 7 with gastric ulcer, 1 with suspected marginal ulcer and 1 with radiologically confirmed marginal ulcer were placed on feedings at two hour intervals of dextrin-maltose and a preparation made by hydrolyzing amino acids. Included in the group were the 4 original patients with peptic ulcer who were given the treatment prior to contemplated gastrectomy. The mixture fed contained from 0.5 to 0.8 Gm. of nitrogen and 40 to 50 calories per kilogram of body weight in twenty-four hours. The length of the ulcer history varied from one month to twenty years; 14 were "intractable" cases, as defined by symptoms which had not improved after complete bed rest and strict Sippy treatment for a period of one to five weeks. There were 27 cases in which pain or epigastric distress was the persistent symptom; this stopped in twenty-four hours in 14 and in forty-eight hours in 13. Vomiting, a symptom in 13 cases, stopped immediately after the institution of a diet in 6. Occult blood was present in 15 cases and disappeared within one week. The New York investigators believe that the prompt improvement manifest in these cases appears to be due to the protein hydrolysate, which is simultaneously an antacid and an easily assimilable food which can be built into the tissue. In the course of this work the protein deficiency was demonstrated in a large percentage of patients with peptic ulcer. The treatment, they point out, does not insure against recurrences when the patient reverts to old dietary habits. Although the number of cases is small and the period of observation short, this therapeutic and supportive use of high caloric and high amino acid feedings deserves to be studied extensively by other qualified investigators.

CONGRESS ON MEDICAL EDUCATION

The Council on Medical Education and Hospitals has announced that the Annual Congress on Medical Education and Licensure will be held at the Palmer House in Chicago on Feb. 11 and 12, 1946. This important session will deal primarily with reconversion problems, including the continuation education of physician veterans, the relocation of physicians and the transition to a peacetime educational program in medical education. Medical educators, licensure authorities, specialty boards and many other groups find these annual meetings of great value. It is particularly important that hotel reservations be made without delay.

MEDICINE AND THE WAR

ARMY

INTERNAL MEDICINE CONFERENCE AT LETTERMAN GENERAL HOSPITAL

A conference on internal medicine was recently held at the Letterman General Hospital, San Francisco, under the direction of Brig. Gen. Charles C. Hillman, commanding general of the hospital, and was attended by medical chiefs, consultants and surgeons of various hospitals and service commands. Brig. Gen. Hugh J. Morgan, chief consultant in medicine, represented the Office of the Surgeon General and spoke on the role of medicine in the Pacific war, and Major Clarence Livingood, consultant in dermatology, took part in a panel discussion of diphtheria and lichenoid and allied skin diseases.

McCLOSKEY GENERAL HOSPITAL CITED

The Meritorious Service Unit Plaque was recently awarded to the 1884th Service Command Unit, McCloskey General Hospital, Temple, Texas. By command of Lieut. Gen. Walton H. Walker, commanding general of the Eighth Service Command, the hospital unit is cited "for outstanding devotion to duty, achievement and maintenance of a high standard of discipline from Jan. 1, 1944 to July 1, 1945. As a result of their outstanding devotion to duty, the hospital motto 'Kindness, Happiness and Efficiency' has become a living thing in the minds of patients."

QUALIFIED RESERVE OFFICERS TO RECEIVE PROMOTION

Qualified reserve officers who have not yet received a promotion while on active duty will receive one promotion as they are separated, the War Department recently announced. To be eligible for this promotion, the officer must have served two years in his present rank since Sept. 16, 1940 and must have an efficiency rating of at least 35. This does not apply to promotion above the rank of colonel.

ARMY AWARDS AND COMMENDATIONS

Captain Robert S. Peers

The Bronze Star was recently awarded to Capt. Robert S. Peers, formerly of Oakland, Calif., for meritorious achievement in connection with military operations against the enemy at Leyte, Philippine Islands, from April 30, 1945 to Sept. 2, 1945. "Captain Peers as dispensary surgeon was responsible for the sanitation and medical service for headquarters of a major command. Through his unstinting efforts he maintained an exceptionally high degree of professional medical care and was available at all hours of the day or night. By his patient, sympathetic and therapeutic ministrations he gained admiration and esteem of the men in his unit as well as his patients. Through his efficiency, insistence on sanitary and preventive medical measures and careful attention to duty at all times, Captain Peers contributed greatly to the maintenance of health and morale of this headquarters. His performance of duty was such as to reflect great credit on himself and was in keeping with the best traditions of the military service." Dr. Peers graduated from McGill University Faculty of Medicine, Montreal, in 1930 and entered the service Sept. 9, 1942.

Captain Theodore W. Cooney

The Bronze Star was recently awarded to Capt. Theodore W. Cooney, formerly of Helena, Mont. The citation states that he was awarded the bronze star "for distinguishing himself by meritorious service in connection with military operations against an enemy of the United States from July 4, 1944 to May 8, 1945 in France, Luxembourg, Belgium and Germany.

Captain Cooney consistently demonstrated outstanding ability, initiative and skill in the accomplishment of his duties as battalion surgeon. His medical skill, devotion to duty and personal attention to the officers and men proved a material contribution to the *esprit de corps*, combat efficiency, health and welfare of his engineer combat battalion under the severest combat conditions and is worthy of the highest praise." Dr. Cooney graduated from St. Louis University School of Medicine in 1941 and entered the service July 1, 1942.

Major Burdette J. Buck

Major Burdette J. Buck, formerly of Hartford, Conn., was recently awarded the Bronze Star. Dr. Buck was cited for meritorious achievement in support of combat operations against the enemy on the island of Negros in the Philippines, where he served as chief of medical service in the 37th Hospital. He assumed command of the organization June 1, 1945. Dr. Buck graduated from Harvard Medical School, Boston, in 1926 and entered the service in August 1942.

Captain Edgar G. Ingalls Jr.

The Bronze Star was recently awarded to Capt. Edgar G. Ingalls Jr., formerly of Minneapolis, for "heroic achievement" in connection with operations against the enemy in the battle of Leyte on Nov. 19, 1944, while in command of Company E of the same battalion. Dr. Ingalls graduated from the University of Minnesota Medical School, Minneapolis, in 1942 and entered the service July 1, 1942.

Lieutenant Colonel Luis A. Passalacqua

The Legion of Merit was recently awarded to Lieut. Col. Luis A. Passalacqua, formerly of Ponce, Puerto Rico, for "meritorious conduct in the performance of outstanding services from Nov. 17, 1943 to Oct. 1, 1945." Dr. Passalacqua graduated from George Washington University School of Medicine, Washington, D. C., in 1925 and entered the service Oct. 15, 1940.

Capt. Jack G. Blackstone

Capt. Jack G. Blackstone, formerly of Indianapolis, was recently awarded the Bronze Star and one Oak Leaf Cluster for "exceptional medical skill and courage in caring for the wounded while under fire." Dr. Blackstone graduated from the Indiana University School of Medicine, Indianapolis, in 1942 and entered the service Jan. 27, 1944.

Captain Thaddeus J. Valenski

Capt. Thaddeus J. Valenski, formerly of Thompsonville, Conn., recently received an American citation for his service throughout the Italian, French and German campaigns. Dr. Valenski graduated from Tufts College Medical School, Boston, in 1937 and entered the service Sept. 29, 1942.

Major Phil Bleecker

Major Phil Bleecker, formerly of Memphis, Tenn., was recently awarded the Bronze Star "for meritorious achievement during the Italian campaign." The award was in relation to special work in the study of malaria. Dr. Bleecker graduated from the University of Tennessee College of Medicine in 1936 and entered the service June 28, 1941.

Lieutenant Colonel John D. Hughes

The Legion of Merit was recently awarded to Lieut. Col. John D. Hughes, formerly of Memphis, "for outstanding service from Nov. 10, 1943 to March 24, 1945 with the Medical Corps in Italy." Dr. Hughes graduated from the University of Tennessee College of Medicine, Memphis, in 1935 and entered the service July 10, 1941.

MISCELLANEOUS

WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

California

Birmingham General Hospital, Van Nuys: Recent Developments in Diabetes, Dr. Howard F. West, December 12; Neurosurgery, Capt., Everett Dickinson, December 26.

U. S. Naval Hospital, Corona: The Streptococcus Problem, Lieut. Comdr. George R. Underwood, December 15; The Use of Products of Fibrinogen and Thrombin in Otolaryngology, Capt. Harry P. Schenck, December 27.

A. S. F. Regional Station Hospital, Oakland: Nephritis, Dr. Thomas Addis, December 12.

U. S. Naval Hospital, Long Beach: Low Back Pain, Major Samuel Weaver, December 19.

Station Hospital, Camp Stoneman, Pittsburg: Diagnosis and Treatment of Abnormal Mechanisms of the Heart, Dr. William J. Kerr, December 15.

Illinois

Station Hospital, Camp Grant: The Treatment of Hypertension by Both Medical and Surgical Means, Dr. Chester M. Kurtz, December 12.

Regional Hospital, Chanute Field, Rantoul: Chronic Disabilities of the Shoulder Region, Dr. Arthur Steindler, December 12.

Station Hospital, Fort Sheridan: Psychosomatic Orientation, Capt. Charles O. Sturdevant, December 12.

Gardiner General Hospital, Chicago: History and Development of Blue Cross Plans, Dr. C. Rufus Rorem, December 5; Section of Vagus Nerves to the Stomach and Treatment of Gastrointestinal Ulcer, Dr. Lester Dragstedt, December 12; Degenerative Lesions of the Nervous System, Dr. LeRoy H. Sloan, December 19.

Mayo General Hospital, Galesburg: Gallbladder Disease, Dr. Warren H. Cole, December 19; The Psychosomatic Problem as Seen from the Point of the Internist, Sidney A. Portis, December 22.

Indiana

Billings General Hospital, Fort Benjamin Harrison: Dermatitis Medicamentosa and Dermatitis Due to Local Irritants, Dr. Francis E. Senear, December 11.

Wakeman General Hospital, Camp Atterbury: Ménière's Disease, Dr. John R. Lindsay, December 12.

Tennessee

Kennedy General Hospital, Memphis: Diagnosis of Bronchogenic Carcinoma, Dr. Robert G. Bloch, December 14.

Wisconsin

Station Hospital, Camp McCoy: The Biochemical Investigation of the Malarial Parasite, Dr. E. A. Evans, December 5; Infectious Hepatitis, Dr. William Middleton, December 12; Recent Advances in Endocrinology, Dr. W. O. Thompson, December 19.

Station Hospital, Truax Field, Madison: Clinical Significance and Management of Anemias, Dr. F. W. Madison, December 5; Nerve and Tendon Injuries, Dr. Sumner Koch, December 19.

UNRRA NEWS

Campaign to Stamp Out Malaria in Italy

According to a recent announcement from the Italian UNRRA mission, the Italian people are cooperating wholeheartedly in the campaign being waged by their government and the United Nations Relief and Rehabilitation Administration to stamp out malaria and other diseases by killing mosquitoes and other insects.

In the small commune Pomezia, during the past summer, most of the population of 4,500 were stricken with malaria. It was necessary to spray more than 20,000 acres of land with

DDT to destroy mosquitoes. Homes in the area also were sprayed. At Formia, Fondi, Minturno and Scauri, in Latina province, more than 2,500 homes were disinfested. At Fondi, instead of spraying individual homes, the workers tried an experiment of spraying two large concentric circles around the town itself to erect a poison barrier to mosquitoes breeding outside.

The Pontine marshes, a malarial poison spot once drained by the Italians, had been flooded again by the retreating Germans and the old mosquito-breeding tendencies restored. Allied military authorities did the initial drainage work of restoring pumping stations, removing canal obstructions, repairing bridges, removing mines and "dusting" the marshes with Paris green poison from airplanes. UNRRA arranged for the use, by the Italian government, of 7½ million lire to continue the work. It was also requested to lend personnel and equipment to disinfect certain areas which had been missed previously.

UNRRA also gave extensive help with supplies, equipment and supervision in spraying of homes and animal shelters in a 29,000 acre area at Aprilia and in 700 homes at Cassino. Plans are under way for DDT treatment of an afflicted zone in Siracusa which necessitates the spraying of 10,000 homes.

VETERANS

VETERANS ADMINISTRATION TO ASSUME CONTROL OF PROSTHESES

At a recent news conference the following major points were developed by Major Gen. Paul R. Hawley, acting surgeon general of the Veterans Administration:

1. The Veterans Administration will take over on Jan. 1, 1946 all of the development and research work being conducted on prosthetic and sensory devices (artificial limbs, hearing aids, dentures and so on) by the Office of Scientific and Research Development, a wartime agency which is scheduled to go out of existence December 31. In addition, the Veterans Administration will assume on Jan. 1, 1946 the Army's experimental work in these fields in connection with the OSRD and the National Academy of Sciences.

2. This means that the Veterans Administration will become the central federal agency for all research and development work on prosthetic appliances, a step that has been advocated by some congressional and other sources, so that all government as well as outside agencies may benefit from the results of a unified program.

3. Arrangements are now being made with the Bureau of the Budget to transfer the existing research contracts, effective Jan. 1, 1946, to the Veterans Administration so that this work may be continued on an uninterrupted basis. It is estimated that the work will require \$1,000,000 per year.

4. The original research and development work on artificial limbs and other prosthetic and sensory devices was initiated through a Special Committee on Prosthetic Devices headed by Dr. Paul E. Klopsteg. It was established by the National Research Council on March 20, 1945 to conduct an intensive campaign in this field, which resulted in many excellent results. In addition to the OSRD program, the Veterans Administration has been conducting limited experimental and development work at its hospital in the Bronx, New York.

5. It is emphasized, however, that the permanent research and development program is concerned only with the long-range future aspect of the problem. In other words, it seeks to develop the best and most modern appliances and does not include instruction as to their actual and immediate usage.

6. To meet this vital phase of the problem, the Veterans Administration has formulated plans for an immediate research and educational program to teach the disabled veteran to use artificial limbs or other prosthetic and sensory appliances properly as quickly as possible. Leading specialists in this field will be employed to supervise the activities. A formal announcement will be made as soon as key personnel have been selected to head the program.

PHYSICIANS SEPARATED FROM SERVICE

ARMY MEDICAL CORPS OFFICERS RECOMMENDED FOR/OR RELIEVED FROM ACTIVE DUTY

Alabama

Abbott, Charles E. Jr., Lt. Col., 27 Univ. Cir., Tuscaloosa.
Cooley, Beamon S. Jr., Major, 1322 N. 31st St., Birmingham.
Holman, Norman W., Capt., Ozark.
Robinson, Edward B. Jr., Major, TCI Hosp., Fairfield.
Tasley, Gerald H., Lt. Col., 701 E. Pryor, Athens.
Welch, Oliver W., Capt., 506 Norfolk Lane, Birmingham.
Williams, James C., Capt., % Mrs. W. W. Williams, Atmore.

Arizona

Wheeler, Norman O., Capt., 604 S. 2d St., Globe.

Arkansas

Chamberlain, Warren W., Lt. Col., 34 Ramble Rd., Hot Springs.
Heinemann, Sol, Capt., 510 Walnut St., Newport.
Hosmer, Silas R., Capt., Vet. Hosp., Fayetteville.
Reagan, Charles H., Major, Marked Tree.
Regnier, Waldo A., Major, 145 Main St., Crossett.
Schirmer, Roy E., Capt., % Health Dept., Fort Smith.

California

Abbott, Charles G., Capt., 360 W. Elk St., Glendale.
Althouse, Hugh C., Capt., 1401 S. Hope St., Los Angeles.
Arnold, Ferris L., Major, 110 Pine Ave., Long Beach.
Baisinger, Cecil F., Capt., 100 Congress St., Pasadena.
Bell, Nelson C., Capt., 3536 Scott St., San Francisco.
Bolton, Warren F., 1st Lt., 139 S. Boyle Ave., Los Angeles.
Bradley, William G., Major, 7755 Jellico Ave., Northridge.
Bramble, Russell B., Lt. Col., Gen. Del., S. San Francisco.
Bronstein, Louis J., Capt., Dos Palos.
Bryner, Sergius, Capt., 1127 Johnson Ave., Menlo Park.
Covel, Martin B., Capt., U. C. of Hosp., San Francisco.
Du Brow, Aaron A., Major, Community Hosp., Long Beach.
Finocchiaro, Cirino, Capt., 1506 W. Vernon Ave., Los Angeles.
Friedrich, Leland E., Capt., 2701 14th Ave., Oakland.
Gilmore, William L., Capt., 1494 7th Ave., San Francisco.
Gump, Millard E., Major, 694 Haddon Rd., Oakland.
Hendricks, Coleman B., 1st Lt., 1200 N. State St., Los Angeles.
Hittleman, Joseph, Capt., 132 N. Soto St., Los Angeles.
Kittle, W. F., Major, 1027 S. Westmoreland Ave., Los Angeles.
Lones, Frank E., Capt., 945 Vine St., Paso Robles.
Lyon, Thomas P., Major, 135 N. Dowdy St., Gilroy.
Madsen, Leo J., Lt. Col., 142 Adelaide Dr., Los Angeles.
Maguire, Joseph F., Lt. Col., 755 Lillian Way, Hollywood.
Miller, Donald B., 1st Lt., Rt. 1, Box 718, Crescent City.
Morris, George W., Capt., 4439 35th St., San Diego.
Pettet, Charles H., Capt., 2200 W. 3d St., Los Angeles.
Portalupi, Henry C., Capt., 487 E. Julian St., San Jose.
Rehm, Robert, Capt., Southern Pacific Hosp., San Francisco.
Robertson, John W., Capt., Box S, Livermore Sanit., Livermore.
Robinson, Hewitt H., Col., 1636 High St., Oakland.
Ruhv, Carl, Capt., 8125½ Blackburn Ave., Los Angeles.
Schock, Robert H., Capt., Post Office Bldg., Soledad.
Schwarz, Hubert F., Major, 96 Broadmoor, San Anselmo.
Shotwell, Cecil L., Capt., 1422 N. Genesee Ave., Hollywood.
Silverglade, Alexander, Major, Arroyo Del Valle, Livermore.
Silverstein, Bernard, Major, 3787 S. Vermont Ave., Los Angeles.
Stanler, Allan E., Major, 1108 Whitley, Corcoran.
Toma, John J., Major, 6667 Sunset Blvd., Hollywood.
Ward, Henry C., Capt., 1146 Cedar Ave., Long Beach.
Wells, Robert W., Capt., 3810 Sacramento St., San Francisco.
White, Carroll W., Major, 1728 4th St., LaVerne.
Williams, A. J., Lt. Col., 61 San Andreas Way, San Francisco.
Wolf, Robert W., Capt., 870 Market St., San Francisco.
Zombro, Frederick B., Capt., 1701 Fairmont Ave., La Canada.
Zukovich, George E., Lt. Col., 2626 University Ave., San Diego.

Colorado

Blevins, Jason L., Capt., 1323 Locust, Denver.
Steiner, Howard A., Capt., 4315 E. 16th St., Denver.
Stull, John D., 1st Lt., 1560 Downing, Denver.
Tice, Frederick G. Jr., Capt., Mt. Harris.

Connecticut

Diskan, Albert E., Major, Manchester.
Kraszewski, H. W., Capt., 524 Eddy Glover Blvd., New Britain.
Macdonnell, Archibald D., Capt., 310 Thames St., Groton.
Margolius, Norman C., Major, 127 Grove St., Waterbury.
Scanlon, John J., Major, 230 West Ave., South Norwalk.

Delaware

Stroud, Henry H., Major, RD 1, Seaford.

District of Columbia

Hoffman, Jay L., Lt. Col., St. Elizabeths Hosp., Washington.
Simpson, Robert L., Capt., 400 Argyle Ter. N.W., Washington.
Spence, George R., Capt., The Children's Hosp., Washington.
Tobin, William J., Major, Columbia Med. Bldg., Washington.
Tureman, James R., 1st Lt., 3210 Park Pl. N.W., Washington.
Wertz, Fred J., Capt., 3925 Pennsylvania Ave. S.E., Washington.
Whitaker, L. S. Jr., Capt., 1150 Connecticut Ave., Washington.

Florida *

Farrington, C. L., Major, 1543 Almeria Way, St. Petersburg.
Hayes, Candler K., Capt., Madison.
Hinton, Andrew H., Major, 416 Ingraham Bldg., Miami.
MacColl, William A., Capt., 220 25th St., Bradenton.
Stephens, A. M. Jr., 1st Lt., 332 Walnut St., Daytona Beach.

Georgia

Blackford, L. M., Major, 758 Wildwood Rd. N.E., Atlanta.
King, James T., Major, 1062 Oxford Rd., Atlanta.
Ranck, Edward B., Lt. Col., Grady Hosp., Atlanta.
Sawyer, James L., Capt., Box 278, Folkston.
Schmidt, Henry L. Jr., Major, 1009 Egmont St., Brunswick.
Simmons, William G., Capt., Emory Univ. Hosp., Emory.
Sullivan, Francis M., Major, Norcross.
Templeton, Clinton M., Major, 405 Greene St., Augusta.

Idaho

Bovenmyer, Earl S., Major, 243 E. 6th St., Pocatello.
Privett, Lowell B., Major, 1812 Harrison Blvd., Boise.

Illinois

Barbour, Ben H. Jr., Capt., 311 E. Broadway, Centralia.
Beebe, Norman S., Capt., Colfax.
Bendix, Richard M., Capt., 4655 S. Lake Park, Chicago.
Biddlecombe, Duncan, 1st Lt., 109 S. Chestnut, Shelbyville.
Blackard, William J., Capt., 513 N. Webster St., Harrisburg.
Bowen, Robert E., Major, 1819 W. Polk St., Chicago.
Brady, John M., Capt., 5001 W. Monroe St., Chicago.
Braude, Abraham I., Capt., 5543 W. Jackson Blvd., Chicago.
Bunchman, Lester P., Capt., Crang Bldg., Clinton.
Burns, Francis J., Capt., 7207 Blackstone Ave., Chicago.
Campbell, Paul A., Col., 700 N. Michigan Ave., Chicago.
Carney, Paul W., Capt., 757 S. 3d St., DeKalb.
Cendella, Francis J., Major, 1630 5th Ave., Moline.
Crowder, Earl R., Lt. Col., 620 Barton Ave., Evanston.
Culmer, Charles U., Major, Passavant Mem. Hosp., Chicago.
Dahl, John J., Capt., 238 N. Pine Ave., Apt. 206, Chicago.
Drago, Rosario C., Capt., 3315 W. 65th Pl., Chicago.
Eggers, John F., Major, 818 Somonauk, St., Sycamore.
Elhrhardt, Oliver E., Major, 1520 Bates Ave., Springfield.
Einhorn, Harold, Major, Champaign.
Fahrner, Richard H., Capt., 809 Douglas St., Joliet.
Fair, John R., Capt., Wolf Lake.
Fisk, Kenneth L., Capt., 48 Thorndale Ave., Roselle.
Fitzgerald, Gerald J., Capt., 2232 Central Park Av., Evanston.
Fredrikson, Lynn C., Capt., 2100 Burling St., Chicago.
Freiheit, Harold J., Capt., 1018 Broadway, Highland.
Freilich, Joseph K., 1st Lt., 2300 Lincoln Park W., Chicago.
Friedman, Isadore E., Capt., 3131 Douglas Blvd., Chicago.
Gianturco, Cesare, Lt. Col., 602 W. University Ave., Urbana.
Grubman, Marvin, Capt., 3730 Dickens Ave., Chicago.
Guerrieri, John A., Capt., 5202 Wolfram St., Chicago.
Hammond, Kenneth H., 1st Lt., 804 E. Maple St., Hoopston.
Hodges, Clarence V., Capt., 950 E. 59th St., Chicago.
Holmes, George W., Capt., 340 Barry Ave., Chicago.
Horning, Victor H. H., Capt., 1742 New England Ave., Chicago.
Hospers, Cornelius A., Lt. Col., 7245 S. Shore Dr., Chicago.
Johnson, William E. G., Capt., 7811 Euclid Ave., Chicago.
Kimball, Ernest R. Jr., Major, 918 Michigan Ave., Evanston.
Klein, Max E., Major, 2431 N. Nordica Ave., Chicago.
Kobisk, Oliver A., Major, 67 E. Wilson St., Batavia.
Koch, Joseph M., Capt., 1927 Edison Ave., Granite City.
Krawcznski, A. C., Capt., 6044 S. Fairfield Ave., Chicago.
Kunde, Emerson C., Major, 726 Washington St., Woodstock.
Kurtz, James F., Major, 7147 Harvard Ave., Chicago.
Kushner, Abraham, Capt., 2037 Howard St., Chicago.
Levy, Robert C., Capt., 5555 Everett Ave., Chicago.
Lichtenstein, Manuel E., Lt. Col., 1409 N. Kedzie Ave., Chicago.
Loeffler, Robert W., Major, 4137 S. Wrenthal Ave., Berwyn.
McNutt, Justin C., Capt., 620 Maple St., Bloomington.
Martin, Albert G., Major, 545 Hardin St., Aurora.
Martin, Forrest R., Major, 259 N. Water St., Decatur.

ORGANIZATION SECTION

THE NATIONAL HEALTH ACT OF 1945

An Analysis Prepared by the Bureau of Legal Medicine and Legislation, American Medical Association

Immediately following the submission to the Congress by President Truman of his special message on health, November 19, Senator Wagner, for himself and Senator Murray, introduced S. 1606, a bill proposing to enact a National Health Act of 1945. It was referred, at his request, to the Senate Committee on Education and Labor, of which Senator Murray is chairman. The earlier bill introduced by these two Senators, S. 1050, was referred to the Senate Committee on Finance. A companion bill in the House, H. R. 4730, was also introduced the same day by Representative Dingell and referred to the House Committee on Interstate and Foreign Commerce, of which Representative Lea, California, is chairman. The earlier House bill, H. R. 3293, was referred to the House Committee on Ways and Means.

The new bill is seventy-eight pages in length as compared with 185 pages in the earlier bill. Provisions contained in S. 1050 but omitted in the new bill include thirty-one pages proposing a hospital building program, about two pages providing for child welfare services and approximately eighty pages proposing extended unemployment and disability benefits, retirement, survivors and extended disability benefits, social insurance contributions and special credits for military service.

The new bill contains two titles. Title I comprises three parts, Part A proposing grants to states for public health services, Part B proposing grants for maternal and child health services and for services for crippled children, and Part C proposing grants for the medical care of needy persons. Title II carries the caption "Prepaid Personal Health Service Benefits" and is not materially dissimilar, except for provisions for financing the program, from the comparable sections contained in S. 1050. The earlier bill proposed a tax, euphemistically referred to as a "contribution," on employees, employers and the self-employed to finance the compulsory sickness insurance program proposed by it. The new bill imposes no taxes. The program it contemplates, as will appear in more detail later, will be financed, at least as far as the present provisions of the bill are concerned, by appropriations from the general fund. By means of this technique, the sponsors apparently seek to by-pass the Senate Committee on Finance and the House Committee on Ways and Means, the two congressional committees which have jurisdiction over legislation to impose taxes.

TITLE I—GRANTS TO STATES FOR HEALTH SERVICES

This title contains three parts as follows:

Part A—Grants to States for Public Health Services

This part provides for grants to states for public health services and is similar to provisions that were contained in S. 1050. It continues without change the provisions in the Public Health Service Act relating to grants for tuberculosis and venereal disease control. It amends existing provisions relating to grants for public health work in a number of respects including the removal of the limitation on the amount of federal appropriations that may be made available annually, namely, \$20,000,000. The details that a plan must contain to be approved are set forth specifically and the Surgeon General, in carrying out the duties imposed on him in relation to this part, is authorized and directed, with the approval of the Federal Security Administrator, to enter into such agreements or cooperative arrangements as may be necessary to insure coordination in the administration of programs and services under this part with those relating to grants to maternal and child health services, to crippled children services and to those contemplated under Title II of the bill.

A new definition of the term "public-health work" is proposed in the bill as follows:

"the term 'public-health work' includes customary and accepted functions, services, and activities of public-health agencies with respect to: public-health administration; training of personnel; vital statistics; sanitation of the human environment; control of communicable and preventable diseases; laboratory services; protection of health in maternity, infancy, and childhood; public-health education; public-health nursing; research and the performance of demonstrations; medical and related services for prevention or mitigation of sickness or disability and for the prevention of premature death; planning and coordination of health services and activities; enactment and enforcement of necessary standards and regulations; production or procurement, and distribution, of therapeutic and prophylactic preparations; and related matters. The term does not include: construction of hospitals, water supplies, sewerage or other waste-disposal systems, or of other facilities; operation or maintenance of hospitals (except hospitals for persons afflicted with infectious diseases), water supplies, sewerage or other waste-disposal systems; and related matters."

Part B—Maternal and Child Health Services

This part amends existing provisions in the Social Security Act relating to this subject. Under existing law \$5,820,000 is the limit that may be appropriated annually for these services. The pending bill proposes to remove this limit. It provides that state plans must make available facilities for local maternal and child health services and that a plan must be in effect in all political subdivisions of the state not later than a date ten years after the date of approval of the first state plan approved under this part. A state plan must provide, too, for cooperation with medical, health, nursing, education and welfare groups and organizations and, when necessary, "for working agreements with any public agencies administering or providing services related to the services furnished under the State plan, including public agencies concerned with nursing, education, welfare, assistance, social insurance, workmen's compensation, labor, industrial hygiene, or medical care." The existing law specifies that a state plan must provide for the development of demonstration services in needy areas and among groups in special need. The reference to "needy areas and among groups in special need" will be eliminated by the bill. A state plan must provide, too, for the furnishing of services and facilities to "all mothers and children in the State or locality who elect to participate in the benefits of the program." The Children's Bureau would continue to be the administrative agency.

Services for Crippled Children

This section of the bill would amend the provisions in the Social Security Act relating to services for crippled children. It would relate not only to crippled children but to children otherwise physically handicapped. Here again the reference in existing law to rural areas and to areas suffering from severe economic distress would be eliminated.

Under existing law the annual appropriation that may be made available for services for crippled children is limited to the sum of \$3,870,000. The bill would remove this limitation. A state plan, under the new provision in the bill, must be in effect in all political subdivisions of the state and the services and facilities must be made available to all crippled children not later than a date ten years after the date of approval of the first plan approved under this section. The bill would also provide for cooperation with the several groups as designated in the section of the bill relating to maternal and child health services. Also, the services and facilities under a state plan

must be made available to "all crippled children in the State who elect to participate in the benefits of the program." A new formula is suggested for determining the amount of federal money that will be made available to the states under this part. At the present time federal moneys are made available on a fifty-fifty basis.

The Children's Bureau will be specifically directed to make and aid the financing of such studies, demonstrations, investigations and research as will promote the efficient administration and operation of programs under this part. In such administration, the Chief of the Children's Bureau will be required to pursue general policies established by her after consultation with advisory committees composed of professional and public members which she herself will appoint with the approval of the Secretary of Labor. These advisory committees, it is contemplated, will advise the Chief of the Children's Bureau on matters pertaining to the furnishing of the care and services. The Chief of the Children's Bureau will be required, too, to consult with a conference of the state health officers and in so far as practicable must obtain the agreement of the state authorities prior to the issuance of any general policies.

The Chief of the Children's Bureau will be directed, with the approval of the Secretary of Labor, to enter into such agreements or cooperative working arrangements with the Surgeon General of the Public Health Service and with the Social Security Board as may be necessary to insure coordination in the administration of programs and services administered by her with those under the part relating to grants for public health services and the part relating to grants to states for medical care of needy persons, the latter being a new provision in the bill.

An additional appropriation for the fiscal year ending June 30, 1946 of \$5,000,000 will be authorized for the administrative expenses of the Children's Bureau and this appropriation may be used for studies, demonstrations, investigations and research, the training of personnel for federal, state and local services and the payment of salaries and expenses of personnel detailed to state agencies. Thereafter, so much will be authorized as necessary.

Part C—Grants to States for Medical Care of Needy Persons

In S. 1050, there was contained a part relating to a comprehensive public assistance program under which assistance was given to the states to aid needy individuals. This part has been modified so that it relates only to the supplying of medical care to such persons. For the fiscal year ending June 30, 1946 an appropriation of \$10,000,000 will be authorized to enable each state to provide medical care for needy persons. Thereafter so much will be authorized as may be needed. In order to participate in this program, a state must submit plans for the approval of the Social Security Board. A state plan for medical care must—

(1) provide that it shall be in effect in all political subdivisions of the state, and if administered by them, be mandatory upon them;

(2) provide for financial participation by the state;

(3) provide for the establishment or designation of a single state public assistance agency to administer or supervise the administration of the plan;

(4) provide for granting to any individual whose claim for medical care is denied, an opportunity for a fair hearing;

(5) provide for such methods of administration as found by the Social Security Board to be necessary, including methods relating to the establishment and maintenance of personnel standards on a merit basis;

(6) provide for making reports to the Social Security Board;

(7) provide safeguards which restrict the use or disclosure of information concerning recipients; and

(8) provide that the state agency shall, in determining need for medical care, take into consideration (a) the requirements of individuals claiming medical care under the plan and (b) any income and resources of an individual claiming medical care under the plan.

If a state plan fulfils the required conditions, the Social Security Board will be required to approve it but the Board

may not approve any plan which imposes as a condition of eligibility any citizenship or residence requirements or any requirement which excludes any recipient of public assistance under a state plan approved under the Social Security Act. A formula is proposed for the allotment of federal funds to the states that have plans approved by the federal agency.

In carrying out the duties imposed on it, the Social Security Board is directed, with the approval of the Federal Security Administrator, to enter into such agreements or cooperative working arrangements with the Surgeon General of the Public Health Service, and with the Chief of the Children's Bureau, as may be necessary to insure coordination in the administration of programs and services under this part with those under the part relating to grants to states for health services, the part relating to maternal and child health services and the title providing personal health service benefits.

The medical care to be furnished under this part may be provided either (1) by the state or local public assistance agency administering the plan through (a) money payments to individuals claiming such care, or (b) payments to persons or institutions furnishing such care, or (c) direct provision of such care; (2) in accordance with agreements, authorized in regulations by the Social Security Board, between such state or local agency and other agencies of the state or political subdivision thereof, by such other agencies; or (3) through arrangements by a state or local public agency with the Surgeon General for services furnished under Title II, on the basis of equitable payments to the Account established by that title; or (4) through such combination or modification of the foregoing as the Social Security Board may approve.

TITLE II—PREPAID PERSONAL HEALTH SERVICE BENEFITS

This title proposes to make available personal health service benefits to currently insured employees, to specified dependents of such employees, to individuals entitled to monthly benefits under Title II of the Social Security Act relating to old age and survivors insurance benefits, to the self-employed and to certain others. It follows closely the comparable provisions in S. 1050 and will be administered by the Surgeon General of the United States Public Health Service, under the supervision and direction of the Federal Security Administrator. He will be required to "consult" with the National Advisory Medical Policy Council on certain matters.

There will be created on the books of the Treasury Department a separate account to be known as the "Personal Health Services Account," and there will be authorized to be appropriated to this account such sums "as may be required to finance the benefits, payments, and reimbursements provided under this title." The bill, as now framed, does not indicate the method by which the sums so appropriated will be raised. Senator Wagner has indicated an intention to defer consideration of a method of financing until the Congress determines whether or not to provide the benefits contemplated by this title. In this connection, he caused to be inserted in the Congressional Record, at the time he introduced his bill, the following statement:

"A Nation-wide comprehensive prepayment medical-care plan can be financed in any one of several different ways. Premiums can, for such a purpose, be raised through income or general taxes or through pay roll contributions, or both. In either case minimum and maximum provision can be provided. The extent of a general governmental contribution out of general revenues to such a plan depends upon the comprehensiveness of the groups covered and the services provided. All in all, these problems are best decided after a decision has been reached on all the details of the medical-care plan itself. Moreover, the financial details relating to the raising of the revenue for the plan raises many special problems which have a bearing on existing income taxes and pay roll contributions and should be considered in relation to these laws.

"The bill does not, therefore, specify any particular method by which the sums authorized to be appropriated under section 212 of title II would be raised. Since under the Constitution legislation relating to the raising of revenue must originate in the House of Representatives, this matter has been left to separate legislation. There is already pending before the Congress legislation (H. R. 3293 and the companion bill S. 1050) which provides for the raising of revenue for personal health service benefits. This separation of legislation between the

revenue and benefit aspects of the program is in keeping with previous practice. In both 1935 and 1937 legislation relating to railroad retirement was considered and enacted in this way.

"It is both necessary and desirable that first and foremost consideration should be given to the benefits. If the Congress thinks that it is sound to provide prepaid medical care to the American people, the method of financing such a plan can be worked out jointly by the appropriate committees of the Congress which have jurisdiction over these matters."

Definitions

The following definitions contained in this title are identical with those contained in the earlier bill, S. 1050:

The term "personal health service benefits" is defined to include general medical benefits, special medical benefits, general dental benefits, special dental benefits, home nursing benefits, laboratory benefits and hospitalization benefits.

The term "general medical benefit" means services furnished by a legally qualified physician or by a group of such physicians, including all necessary services such as can be furnished by a physician engaged in a general or family practice of medicine, at the office, home, hospital or elsewhere, including preventive, diagnostic and therapeutic treatment and care, and periodic physical examination.

The term "special medical benefit" is defined as necessary services requiring special skill or experience, furnished at the office, home, hospital or elsewhere by a legally qualified physician who is a specialist or consultant with respect to the class of service furnished, or by a group of such physicians, or by a group of physicians including such specialists or consultants.

The term "general dental benefit" is defined to mean services furnished by a legally qualified dentist or by a group of such dentists, including all necessary dental services such as can be furnished by dentists engaged in the general practice of dentistry, with or without the aid of an assistant or hygienist under his direction, and including preventive, diagnostic and therapeutic treatment, care and advice, and periodic examinations.

The term "special dental benefit" is defined to mean necessary services requiring special skill or experience, furnished at the office, hospital or elsewhere by legally qualified dentists (with or without the aid of an assistant, hygienist or anesthetist under his direction) who is a specialist or consultant with respect to the class of service furnished, by a group of such dentists, or by a group of dentists, including such specialists or consultants.

"Home nursing benefit" means nursing care of the sick furnished in the home by (1) a registered professional nurse or (2) a practical nurse who is legally qualified by a state or, in the absence of state standards or requirements, who is qualified with respect to standards established by the Surgeon General after consultation with the Advisory Council and with competent professional nursing agencies and who furnishes nursing care under the direction or supervision of the state health agency, the health agency of a political subdivision of a state or an organization supplying and supervising the services of registered professional nurses.

The term "laboratory benefits" means such necessary laboratory or related services, supplies or commodities as the Surgeon General may determine, including chemical, bacteriologic, pathologic, diagnostic and therapeutic x-ray and related laboratory services, refractions, and other ophthalmic services furnished by a legally qualified practitioner other than a physician, physical therapy, special appliances prescribed by a physician, and eyeglasses prescribed by a physician or other legalized practitioner. If any of the services, supplies or commodities covered by this definition are provided a hospitalized patient, or by a physician or dentist incidental to services rendered, payment therefor will be included in payments for hospitalization or for services furnished, respectively.

"Hospitalization benefit" is defined to mean an amount, as determined by the Surgeon General after consultation with the Advisory Council: not less than \$3 and not more than \$7 for each day of hospitalization not in excess of thirty days in a period of hospitalization, not less than \$1.50 and not more than \$4.50 for each day of hospitalization in excess of thirty days in a period of hospitalization, and not less than \$1.50 and not

more than \$3.50 for each day of care in an institution for the care of the "chronic sick." In lieu of such compensation, the Surgeon General may enter into contracts with participating hospitals for the payment of the reasonable cost of hospital service at rates for each day of hospitalization neither less than the minimum nor more than the maximum applicable rates previously mentioned, such payment to be full reimbursement for the cost of essential hospital service, including the use of ward or other least expensive facilities compatible with the proper care of the patient.

Any such payment may be included in a contract between the Surgeon General and a participating hospital for inclusive services of a participating hospital and its staff or attending staff. Such payment will not affect the right of participating hospitals to require payments from patients with respect to the additional cost of more expensive facilities furnished for lack of ward facilities or occupied at the request of the patient, or with respect to services not included within a contract.

A hospital may become a "participating hospital" if it is an institution which provides all necessary and customary hospital services and is found by the Surgeon General to afford professional service, personnel and equipment adequate to promote the health and safety of individuals customarily hospitalized in such institutions. The Surgeon General may accredit a hospital for limited varieties of cases and may accredit an institution for the care of the "chronic sick," taking into account, for the purpose of such limited accrediting, the type and size of the community which the institution serves, the availability of other hospital facilities and such other matters as the Surgeon General may deem relevant.

National Advisory Medical Policy Council

A National Advisory Medical Policy Council will be created to consist of the Surgeon General as chairman and sixteen members appointed by him without regard to the Civil Service laws and subject to the approval of the Federal Security Administrator. The appointed members will be selected from panels of names submitted by professional and other agencies and organizations concerned with medical, dental and nursing services and education and with the operation of hospitals and laboratories and from among other persons, agencies or organizations informed on the need for or provision of medical, dental, nursing, hospital, laboratory or related services and benefits. The membership of the Advisory Council must include (1) medical and other professional representatives and (2) public representatives, in such proportions as are likely to provide fair representation to the principal interested groups that furnish and receive personal health services, having regard for the functions of the Advisory Council.

Appointed members will hold office for four years, with terms of office staggered, and will receive compensation at a rate not to exceed \$25 a day for the time spent on official business with the Council plus actual and necessary traveling expenses. The Council will be required to meet not less frequently than twice a year and whenever at least four of the members request a meeting. The Advisory Council will advise the Surgeon General with reference to questions of general policy and administration in carrying out the provisions of Title II including (1) professional standards of quality to apply to personal health service benefits; (2) designation of specialists and consultants; (3) methods and arrangements to stimulate and encourage the attainment of high standards through the services of general or family practitioners, specialists and consultants, laboratories and other auxiliary services, and through the coordination of the services of physicians and dentists with those of educational and research institutions, hospitals and public health centers, and through other means; (4) standards to apply to participating hospitals, to the relations or coordination among hospitals and to the establishment and maintenance of the list of participating hospitals; (5) adequate and suitable methods and arrangements of paying for personal health service benefits; (6) studies and surveys of personal health services and of the quality and adequacy of such services; and (7) grants-in-aid for professional education and research projects. The Advisory Council will be required to establish special advisory, technical, regional, or local committees or commissions whose membership may include members of the Council or other persons or both, to advise on

general or special questions, professional and technical subjects, questions concerning administration, problems affecting regions or localities, and related matters.

Selection of Physicians; Acceptance of Patients; Panels

The Surgeon General will be required to publish and otherwise make known in each local area to individuals entitled to benefits the names of medical and dental practitioners and groups of practitioners who agree to furnish services as benefits and to make such lists of names readily available to individuals entitled to benefits. Such lists must include general or family practitioners and qualified specialists and consultants. With respect to qualified specialists and consultants the lists must indicate the class or classes of specialist or consultant services for which each has been qualified. Any physician, dentist or nurse legally qualified by a state to furnish any services included as personal health service benefits will be legally qualified to furnish such benefits, including any group of physicians, dentists or nurses or combinations thereof whose members are similarly qualified.

Likewise a beneficiary may select any practitioner appearing on a panel to treat him subject to the consent of the practitioner or the group of practitioners, as the case may be. This freedom of choice of practitioner is conditioned, however, on the right of the Surgeon General, "in order to maintain high standards in the quality of services furnished as medical or dental benefit," to prescribe maximum limits to the number of potential beneficiaries for whom a practitioner or group of practitioners may undertake to furnish services, and such limits may be nationally uniform or may be adapted to take account of "relevant factors." Every beneficiary and every group of beneficiaries will be permitted to make selection of a practitioner through a representative of his or its own choosing.

The services of specialists or consultants will ordinarily be available only on the advice of the general or family practitioner or of a specialist or consultant attending the individual. Such services will also be made available "when requested by an individual entitled to specialist and consultant services as benefits and approved by a medical administrative officer appointed by the Surgeon General."

The Surgeon General will designate what shall constitute specialist or consultant services. He will likewise determine who are qualified to render such services, in accordance with general standards prescribed by him after consultation with the Advisory Council. In establishing standards and in designating specialists and consultants, the Surgeon General will be required, "as far as is consistent with the purposes of this title," to "utilize standards and certifications developed by competent professional agencies" and must "take into account the personnel resources and needs of regions and local areas."

Payments for the Services of Practitioners

Payments to general medical and family practitioners or to general dental practitioners may be made (1) on the basis of fees for services rendered, according to a fee schedule, (2) on a per capita basis, the amount being according to the number of individuals entitled to benefits who are on the practitioner's list, (3) on a salary basis, full time or part time or (4) on a combination or modification of these bases, as the Surgeon General may approve. The method of payment will apparently be determined in each local area as the majority of the general medical and family practitioners or of the general dental practitioners, respectively, may elect. The Surgeon General may also make payments by another method from the one selected in a local area to those general medical and family practitioners or general dental practitioners who do not elect the method designated by the majority. Any of the methods of making payments indicated in the foregoing may be used, as the Surgeon General may approve, in making payment to groups of practitioners that contain designated specialists or consultants as well as general or family practitioners. The Surgeon General may negotiate agreements or cooperative working arrangements to utilize inclusive services of hospitals and their staffs or attending staffs and may enter into contracts for such inclusive services.

Payments to designated specialists and consultants may be made on the basis of salary (whole time or part time), per session, fee for service, per capita or other basis or combination, as the Surgeon General and the specialists and consultants may agree.

Rates or amounts of payment for particular services or classes of services may be nationally uniform or may be adapted to take account of relevant regional or local conditions and other factors. Payments shall be adequate, "especially in terms of annual income or its equivalent and by reference to annual income customarily received among physicians, dentists and nurses, having regard for age, specialization and type of community." Payment will be commensurate with skill, experience and responsibility involved in furnishing service. In any local area where payment for services of a general or family practitioner is only on a per capita basis, the Surgeon General, the bill proposes, shall make per capita payments on a pro rata basis among the practitioners and groups of practitioners of the local area on the panel with respect to those individuals who after due notice have failed to select a general or family practitioner or who, having made one or more successive selections, have been refused by the practitioner or practitioners selected.

In each local area the provision of general medical or dental benefits will be a collective responsibility of all qualified general medical or family practitioners or of all qualified general dental practitioners, respectively, in the area who have undertaken to furnish such benefits.

Home Nursing Benefits

The bill provides that home nursing benefits shall ordinarily be available only on advice of a legally qualified attending physician but must be made available also when requested by an individual entitled to the benefits and when approved by a medical officer designated by the Surgeon General. The method to be used in paying for home nursing services is not clear.

List of Participating Hospitals

The Surgeon General is directed to publish a list of institutions which he finds to be participating hospitals in accordance with general standards prescribed by him after consultation with the Advisory Council. Any institution which is not included in the list, or any institution having been removed from the list, may petition the Surgeon General for a hearing. The bill provides that the Surgeon General shall exercise no supervision or control over a participating hospital unless it is owned or leased and operated by the United States. No requirement for participation by a hospital may prescribe its administration, personnel or operation.

Limitations on General Medical, General Dental, Home Nursing and Laboratory Benefits

The Surgeon General, after consultation with the Advisory Council and subject to the approval of the Administrator of the Federal Security Agency, may determine that every individual entitled to general medical, general dental or home nursing benefits may be required by the physician, dentist or nurse attending him to pay a fee with respect to the first service or with respect to each service in a period of sickness or course of treatment if he believes that such a limitation is necessary and desirable to prevent or reduce abuses of entitlement to the benefits. The maximum amount of such fee will be fixed by the Surgeon General after consultation with the Advisory Council and with the approval of the Administrator of the Federal Security Agency. He may also limit the application of such fees to home calls, to office visits or to both.

The Surgeon General, "having regard for the adequacy of available personnel," may, after consultation with the Advisory Council and with the approval of the Administrator of the Federal Security Agency, restrict the content of the general dental, special dental or home nursing benefit. On and after July 1, 1947, however, the restricted content of the general dental or special dental benefit must include at least (1) examination (including x-rays) and diagnosis, (2) prophylaxis, (3) extraction of teeth which are considered by the dentist and an attending physician to be or likely to be injurious to the gen-

eral health of the individual and (4) treatment of acute diseases of the teeth, their supporting structures and adjacent parts, including fractures of the teeth or jaw. He may also fix an age above which the restriction on content shall apply.

As to the home nursing benefits, restriction of content may limit the service to part time care on an hourly or visit basis or may limit the types of cases for which such benefits shall be available, or the maximum amount of service per case, or otherwise.

The maximum number of days in any benefit year for which an individual may be entitled to hospitalization will be sixty. This maximum may be increased to not more than one hundred and twenty days in a calendar year if funds are adequate.

No application for hospitalization benefits will be valid with respect to any day of hospitalization if filed more than ninety days after such day, or with respect to any day of hospitalization more than thirty days following the diagnosis of tuberculosis or psychosis, or with respect to any day in a hospital or other institution for mental or nervous disease or tuberculosis.

Likewise the Surgeon General, after consultation with the Advisory Council and with the approval of the Federal Security Administrator, may limit for any calendar year or part thereof the cost of laboratory benefits. Such limitation may relate to a class of services, supplies or commodities, to maximum payments per beneficiary in a benefit year, to a specified fraction of the cost or to combinations thereof.

Proposed Method of Administration

The bill provides that the Surgeon General shall perform the duties imposed on him under the supervision and direction of the Federal Security Administrator and after consultation with the Advisory Council as to questions of general policy and administration. He will be authorized to take all necessary steps to arrange for the availability of the benefits provided. He will be directed, after consultation with the Advisory Council as to questions of general policy and administration and with the approval of the Administrator to negotiate and periodically to renegotiate agreements or cooperative working arrangements with appropriate agencies of the United States, or of any state or political subdivision, and with other appropriate public agencies. He may, too, make such agreements or arrangements with private persons or groups of persons to utilize their services and facilities and to pay fair reasonable and equitable compensation therefor. He may negotiate and periodically renegotiate agreements or cooperative working arrangements for the purchase or availability of supplies and commodities necessary for the benefits provided in the bill and to enter into contracts for such services, facilities, supplies and commodities. He will be specifically directed, with the approval of the Federal Security Administrator, to enter into such agreements or cooperative working arrangements with the Chief of the Children's Bureau and with the Social Security Board as may be necessary to insure coordination in the administration of programs and services under Title II with those under parts B and C of Title I.

Except with respect to state or local areas for which other arrangements have been made, the Surgeon General will be directed to appoint local area committees to aid in the administration of Title II. The members of such committees must be selected from panels of names submitted by the professional and other organizations concerned with medical, dental and nursing services and education and with the operation of hospitals and laboratories, and from other persons, agencies or organizations informed on the need for or provision of medical, dental, nursing, hospital, laboratory, or related services and benefits. The membership of such committees must include (1) medical and other professional representatives, and (2) public representatives in such proportions as are likely to provide fair representation to the principal interested groups that furnish and receive personal health services, "having regard for the functions of the local area committees." Such committees, the bill provides, must be consulted at frequent intervals and must be kept informed by the local area officers of the Public Health Service with respect to arrangements for the availability of benefits and policies to be followed. Provision is made for the appointment of similar committees by each state or local cooperating department or agency.

The Surgeon General will be directed to give priority and preference to utilizing the facilities of state and local departments or agencies on the basis of mutual agreements with such departments or agencies. He may delegate to any officer or employee of the United States Public Health Service or of any federal, state or local cooperating department or agency such of his powers and duties, except the prescribing of rules and regulations, as he may consider necessary and proper. He may, after consultation with the Social Security Board, after consultation with the Advisory Council as to questions of general policy and administration, and with the approval of the Federal Security Administrator, prescribe and publish such rules and regulations and require such records and reports, not inconsistent with other provisions of the bill, as may be necessary. Authorization is given for the appointment of such additional personnel in the Public Health Service as is necessary to administer Title II.

The Surgeon General will be required to make a full report to Congress, at the beginning of each regular session, of the administration of the functions devolved on him by the bill, and such reports must include "a record of consultation with the Advisory Council, recommendations of the Advisory Council, and comments thereon."

The bill suggests that the methods of administration, including the methods of making payments to practitioners, shall (1) include the prompt and efficient care of individuals entitled to personal health service benefits; (2) promote personal relationships between physician and patient; (3) provide professional and financial incentives for the professional advancement of practitioners and encourage high standards in the quality of services furnished as benefits; (4) aid in the prevention of disease, disability and premature death; and (5) insure the provision of adequate service with the greatest economy consistent with high standards of quality.

Grants-in-Aid for Medical Education, Research and Prevention of Disease and Disability

The Surgeon General will be authorized to administer grants-in-aid to nonprofit institutions and agencies engaging in research or in undergraduate or postgraduate professional education. Such grants will be made with respect to each project (1) for which application has been received from a nonprofit institution or agency, stating the nature of the project and giving the reasons for the need of financial assistance in carrying it out, and (2) for which the Surgeon General finds, with the advice of the Council and after consultation with other federal departments and agencies concerned with research or professional education that the project shows a promise of making valuable contributions to the education or training of persons useful to or needed in the furnishing of medical, dental, nursing, hospital, laboratory, and related benefits, or to human knowledge with respect to the cause, prevention, mitigation or method of diagnosis or treatment of disease and disability.

The Surgeon General and Advisory Council must give preference and priority, during the five year period beginning Jan. 1, 1946, to grants-in-aid with respect to projects to aid servicemen seeking postgraduate education as medical or dental practitioners or training for administration of personal health services, disability benefits, rehabilitation services and related services.

To finance this part of the program, there will be made available for the calendar year 1946 the sum of \$10,000,000, for the calendar year 1947 the sum of \$15,000,000 and for each calendar year thereafter an amount equal to 2 per cent of the amount expended for benefits under Title II in the last preceding fiscal year.

Existing Prepayment Plans

Senator Wagner reiterates the belief that S. 1606 will not necessarily result in the displacement of existing prepayment medical service and hospitalization plans.

The bill itself, however, does not specifically mention existing prepayment medical service and hospitalization plans. It does direct the Surgeon General, after consultation with the Advisory Council as to questions of general policy and administration, and with the approval of the Federal Security Administrator, to make agreements or arrangements with private agencies or institutions, or with private persons or groups of persons, to utilize their services and facilities.

Miscellaneous Provisions

Sections in the new bill, similar to those in S. 1050, (1) exempt from entitlement to benefits persons entitled to such benefits under workmen's compensation acts, (2) provide for extension of benefits to certain noninsured persons, (3) contemplate additional dental, nursing and other benefits, and (4) make benefits available to certain persons not at present within the social security system, such as employees of designated exempt organizations.

Washington Letter

(From a Special Correspondent)

Nov. 26, 1945.

Artificial Limb Firms Accused of Conspiracy

Assistant Attorney General Wendell Berge presented to a District of Columbia grand jury an indictment charging the Association of Limb Manufacturers of America, forty-five corporations and thirty-four individuals representing 75 per cent of the United States artificial limb industry, with conspiracy to fix high and unreasonable prices for artificial limbs sold to war veterans. The indictment, charging violation of the Sherman Antitrust Act, was promptly voted and returned in District of Columbia court. The indictment charges manufacturers with agreeing to fix minimum and noncompetitive prices in bids submitted to the Veterans Administration on artificial arms and legs supplied to veterans. The manufacturers are also charged with conspiring to fix identical prices to state agencies and agreeing that suppliers of artificial limb parts would refuse to sell to governmental agencies and charitable, public or private institutions that supplied artificial limbs to amputees without cost. Mr. Berge said that a substantial number of the 900,000 artificial limb wearers in the United States are war veterans. He stated that in peacetime about 25,000 amputations occur annually. The indictment says that a total annual sales volume of about \$10,000,000 in artificial limbs is divided among some 250 manufacturers having production capacity of from 15 to 1,500 annually.

Chairman Augustine B. Kelley, Democrat of Pennsylvania, of the House subcommittee on aid to the physically handicapped, said his committee had asked the Justice Department to make the investigation which resulted in the indictment. Further, he stated, it is at his committee's request that the Federal Trade Commission will meet with members of the Association of Limb Manufacturers of America on December 1 in Chicago to set up a "code of ethics" in advertising and salesmanship.

Political Pressure in Veterans' Hospital Sites

The first indication of opposition to Gen. Omar N. Bradley's plan to set up new Veterans Administration hospitals where they will do the most good for veterans rather than where it is expedient for political or geographic patronage has been revealed. Senator Elmer Thomas, Democrat of Oklahoma, has sent a virtual "ultimatum" to General Bradley requesting that the veterans agency take over the 750 bed Glennan Army Hospital at Okmulgee, Okla., which is being closed in the next few days. In taking a stand against "pork barrel politics," said to have been a major factor in the location of veterans' hospitals under the régime of former Veterans Administration Director General Hines, both General Bradley and his acting surgeon general, Major Gen. Paul R. Hawley, have repeatedly emphasized that the interest of the veterans comes first. Their policy calls for setting up new major hospitals in or adjacent to large urban centers so that veterans' hospitals can take advantage of teaching facilities and faculties of large medical centers.

Salaries of \$12,000 to \$15,000 Proposed for Scientists

Dr. Vannevar Bush, director of the Office of Scientific Research and Development, told the Senate Civil Service Committee that two new scientific classifications should be set up in civil service, one for salaries from \$12,000 to \$14,000 a year and the other for \$15,000. Endorsing the federal pay raise bill, he said these salaries were necessary to attract scientists to maintain "adequate preparedness on a scientific basis." Even on this basis, he said, the government would be paying less than industry for scientific workers doing comparable tasks.

Return of Doctors and Dentists from the Armed Forces

Coincident with the announcement by the Secretary of War Patterson that an effort would be made into the need for doctors and dentists now in the Army, Major Gen. Norman T. Kirk, Surgeon General of the Army, announced that the Army expects to discharge all but 11,000 doctors by next June. General Kirk said that keeping doctors in service now is required by the fact that there will be some 220,000 patients still in U. S. Army hospitals as of January 1. By that date he expects that some 14,000 doctors, which is more than one third the number of doctors in the Army Medical Corps at peak strength, will have returned to civilian practice. Mr. Patterson's promise of an inquiry in regard to the number of doctors and dentists now held in service came in response to a charge by Senator Reed, Republican of Kansas, that the Army is holding these men unnecessarily. Army medical officers will continue to be released under previously announced standards, but a further announcement concerning them will be forthcoming around mid-December.

Army Prosthetics Program

Following indictment of national artificial limbs concerns for alleged violation of antitrust laws, the War Department released findings of three specialists who praised the army prosthetics program. They ridiculed charges made in and out of Congress that the Army had supplied limbs of "cheapest" possible construction and declared that amputees get the most costly types obtained from civilian shops. The report was made by a civilian consultant committee composed of Dr. Harold Conn, Akron, Ohio, Dr. Paul B. Magnuson, associate professor of surgery, Northwestern University Medical School, Chicago, and new chief of the Veterans Administration Research Section, and Dr. Philip D. Wilson, clinical professor of orthopedic surgery, Columbia University College of Physicians and Surgeons, New York.

Tuberculosis Rate Among Veterans Reported Very High

Mrs. Elizabeth H. Breeze, Veterans Administration nurse recruitment specialist, said that a "very high" tuberculosis rate among returning veterans has caused a dangerous situation through the lack of nurses trained for the treatment of tuberculosis. She said the percentage of veterans infected with tuberculosis is higher than one ever imagined, revealing that only 12 out of 2,000 nurses queried have shown an interest in the care of tuberculous patients or said they had any training for it.

River Pollution Discussed by House Rivers and Harbors Committee

The annual appropriation of \$100,000,000 to purify the nation's rivers was discussed Tuesday when the House Rivers and Harbors Committee considered a bill sponsored by Representative Spence, Democrat of Kentucky, providing for a water pollution advisory board under the jurisdiction of the U. S. Public Health Service, and agreements between states to prevent dumping of waste and sewage into rivers. Under the Spence bill the U. S. Public Health Service would be empowered to take cases to court when nuisances were not abated.

Senate Committee Reports Favorably on Federal Health Programs

The Senate Civil Service Committee has reported favorably on the Randolph bill to set up health programs in government agencies. Sponsored in the House by Representative Randolph, Democrat of West Virginia, the measure would authorize agencies to establish health services and clinics after consultation with the U. S. Public Health Service. Benefits would be limited to treatment of minor illnesses. An amendment by Senator Hickenlooper, Republican of Iowa, would bar health units where there were only a few workers.

Returning Veterans Urged to Become Pharmacists

A reported shortage of 8,000 for jobs in the field of pharmacy was cited by Dean W. P. Briggs of George Washington University School of Pharmacy to back up his appeal to returning servicemen to consider careers in pharmacy.

Walter Bura Heads Veterans Prosthetic Appliance Service

Walter Bura, 31, retired engineer who lost his leg above the knee in a diving accident five years ago, has been appointed director of the Veterans Administration prosthetic appliance service. He is credited with "revolutionizing" the Army's artificial limb program. He claims that artificial limbs made today are good but that amputees have not been taught how to use them.

Child Care Centers to Operate Until March 1

A Senate appropriations subcommittee has approved, without opposition, expenditure of \$5,415,000 to operate wartime child care centers for another four months. The Federal Works Agency had planned to close the centers October 31, but mothers of the nation raised such a protest that President Truman asked Congress to allow the centers to operate pending study of their need in peacetime.

Licensing of Practical Nurses Proposed

A bill submitted by Charles D. Drayton, attorney for the Graduate Nurses Association, would require all men and women engaged in any form of practical nursing assistance to obtain a \$10 a year license from the Nurses' Examining Board. The bill was rejected some months ago by the District of Columbia commissioners, but a hearing has been ordered to get the opinions of all interested persons.

Bill Would Provide Seeing-Eye Dogs for Blinded War Veterans

Senator Wagner, Democrat of New York, has introduced an amendment to a bill providing for purchase and training of seeing-eye dogs that would provide these dogs to all war blinded veterans before their discharge.

Official Notes

APPLICATIONS FOR GRANTS TO AID IN CLINICAL RESEARCH

The Committee on Scientific Research of the American Medical Association invites applications for grants of money to aid in research in problems bearing more or less directly on clinical medicine. Preference is given to requests for moderate amounts to meet specific needs. As a rule grants are not made for the purchase of equipment or apparatus of a permanent nature. For application forms and further information, please address the committee at 535 North Dearborn Street, Chicago 10.

ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

The Forty-Second Annual Congress on Medical Education and Licensure will be held on Monday and Tuesday, Feb. 11 and 12, 1946 at the Palmer House in Chicago. Monday's session will deal primarily with problems in medical education at the undergraduate, graduate and postgraduate levels. Tuesday will be devoted mainly to questions of licensure. It is imperative that hotel reservations be made at once.

Coming Medical Meetings

American Medical Association House of Delegates, Chicago, Dec. 3-6. Dr. Oliu West, 535 N. Dearborn St., Chicago 10, Secretary.

American Academy of Allergy, Chicago, Dec. 10-11. Dr. Karl D. Figley, 316 Michigan St., Toledo 2, Ohio, Secretary.

American Society of Anesthetists, New York, Dec. 12-13. Dr. McKinnie L. Phelps, 745 Fifth Ave., New York 22, Secretary.

International College of Surgeons, U. S. Chapter, Washington, D. C., Dec. 7-8. Dr. Louis J. Gariepy, 16401 Grand River Avenue, Detroit, Secretary.

Puerto Rico, Medical Association of, San Juan, Dec. 14-16. Dr. Rafael A. Vilar, P. O. Box 3866, Santurce, Secretary.

Southern Surgical Association, Hot Springs, Va., Dec. 4-6. Dr. Alfred Blalock, Johns Hopkins Hospital, Baltimore 5, Secretary.

Medical Legislation

MEDICAL BILLS IN CONGRESS

National Health Act of 1945

Senator Wagner, New York, for himself and Senator Murray, Montana, has introduced S. 1606, proposing to enact a National Health Act of 1945. A companion bill was introduced in the House by Representative Dingell, Michigan, H. R. 4730. This legislation is analyzed in detail in this issue of THE JOURNAL. It proposes additional grants to the states for public health services, for maternal and child health services and for services for crippled children. In addition, it proposes grants to states for medical care of needy persons and provides for prepayment personal health service benefits.

Veterans Administration

After extended hearings on the bill introduced, by request, by Representative Rankin, Mississippi, H. R. 4225, to establish a Department of Medicine and Surgery in the Veterans Administration, the House Committee on World War Veterans' Legislation has caused to be introduced a new bill, H. R. 4717, which has now been reported to the House with recommendation that it pass. Among other things, the new bill would eliminate the provision in the original bill with respect to the creation of the several corps and would provide that the Department of Medicine and Surgery shall include a Chief Medical Director, Medical Service, Dental Service, Nursing Service and Auxiliary Service. The Chief Medical Director and the Deputy Medical Director must be qualified doctors of medicine. Apparently all other medical personnel of the Department of Medicine and Surgery must hold either the degree of doctor of medicine or doctor of osteopathy, thereby specifically authorizing the utilization of osteopathic services in connection with the treatment of veterans.

President Truman has submitted a supplemental estimate of appropriation for the Veterans Administration in the amount of \$158,320,000 to permit the completion of the hospital construction program for the fiscal year 1946 "providing approximately 14,100 additional hospital beds and to make possible the undertaking of the additional construction program for the fiscal year 1946 providing approximately 15,500 additional hospital and domiciliary beds" (H. Doc. 345).

A bill introduced by Representative Hedrick, West Virginia, H. R. 4679, provides compensation for veterans of World War II who have had pulmonary tuberculosis.

Miscellaneous

Senator Reed, Kansas, has submitted S. Res. 184, requesting the Secretary of War to appoint a board to make inquiry into the demobilization of physicians and dentists.

H. R. 4564, introduced by Representative Robinson, Utah, would authorize the Secretary of War to convey certain land situated within the Fort Douglas Military Reservation to the Shriners' Hospitals for Crippled Children.

An appropriation of \$1,000,000,000 for each of three fiscal years would be authorized by H. R. 4151, introduced by Representative Stigler, Oklahoma, to be used by the Federal Works Administrator in making loans and grants to public agencies for public works projects, including hospitals and nurses' homes.

The bill providing for a health program for government employees, H. R. 2716, has been reported to the Senate with amendments.

District of Columbia

Representative Hebert, Louisiana, has introduced H. R. 4456, to regulate the practice of optometry in the District of Columbia. This bill would declare optometry to be a learned profession and would define it "as the science and art devoted to the examination of the eyes, the analysis of the ocular functions and the employment of lenses, prisms, ocular exercises, visual training, orthoptics, preventive or corrective optometric methods, and agents for the relief of visual and ocular anomalies."

Medical News

(PHYSICIANS WILL CONFERR A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS REFLECT TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Housman Denied License.—The state board of medical examiners, at its meeting in Sacramento October 17, denied the restoration of his license to practice medicine in California to Dr. Nathan S. Housman, San Francisco. The physician's license had been revoked after he was convicted of keeping improper narcotic records and of perjury in his testimony at the trial (*THE JOURNAL*, February 10, p. 345).

Changes in Health Personnel.—Dr. George F. O'Brien, Sacramento, has been appointed health officer of Stanislaus County to succeed Dr. J. Lyle Spelman, Ceres, resigned.—Dr. Martin Karr, San Mateo, has been employed as medical officer in the bureau of maternal and child health and assigned to the bureau of vocational rehabilitation, state department of education, where he will give assistance in developing the new physical restoration program of that agency along the lines of the medical care programs of the department of public health.

Refresher Course in Psychiatry.—Beginning January 7, a refresher course in psychiatry for physicians returning from military service will be offered at the Langley Porter Clinic, University of California Medical School, San Francisco. Instruction will be given under the direction of Dr. Karl M. Bowman, professor of psychiatry, at the University of California Medical School, with the assistance of staff members from other divisions of the medical school. Subjects to be covered will include general psychiatry, functional and organic psychoses, psychoneuroses, therapy, psychosomatic problems, neuroanatomy, clinical neurology, neuropathology, x-ray diagnosis, and other related topics. Registration is open to graduates of approved medical schools with nine months' general internship. Preference will be given to applicants with training in psychiatry, to those preparing for examination of the American Board of Psychiatry and Neurology, to graduates of the University of California Medical School, and to legal residents of the state of California. Immediate application for registration is recommended because of the limited enrolment which can be accommodated. Application should be made by letter containing the following information: place of legal residence, medical school attended and date of graduation, experience and training, with special details regarding psychiatric training and record of military service. Additional information may be obtained from University Extension, University of California, 540 Powell Street, San Francisco 2.

CONNECTICUT

Personal.—Dr. James S. Martin has retired as physician at the Taft School, Watertown, after thirty-nine years of service, according to the *New York Times*.

Cancer Grants.—The total of \$41,835 has been made available by the Connecticut Cancer Society to hospitals and communities in Connecticut to aid in the development and expansion of local cancer control programs. The grants will be used for clinical research in hospitals of the state and for specialized nursing and social work personnel. The medical advisory committee of the society considers each request for funds, and allotments are made only for those projects which this committee approves.

Physicians on Board for Inebriates.—Dr. Thomas P. Murdock, Meriden, formerly president of the Connecticut State Medical Society, and Dr. Arthur H. Jackson, Waterbury, are the physician members of newly appointed board of trustees of the Connecticut State Fund for Inebriates. According to an announcement, Connecticut is the first state to enact "sound legislation for the study, care and treatment of alcoholics and to provide for the creation of a board which is authorized to make a study of the problem of alcoholism, to make its findings public, to set up diagnostic and rehabilitation centers and to conduct outpatient clinics." The program will be financed by a fund to which will revert 9 per cent of all income from liquor license permits. Selden D. Bacon, Ph.D., of the department of sociology and the School of Alcohol Studies, Yale

University, is chairman of the board, and the remaining members are Mrs. Edna A. F. Edgerton, representative in the state legislature, and Abraham S. Ullman, state's attorney in New Haven.

DISTRICT OF COLUMBIA

Wallace Yater Resigns from Georgetown.—Dr. Wallace M. Yater, formerly chairman of the Section on Experimental Medicine and Therapeutics of the American Medical Association, has resigned as professor and director of the department of medicine at Georgetown University School of Medicine, Washington. Dr. Yater, who has been editor of the *Medical Annals of the District of Columbia* since its inception in 1932, has been associated with Georgetown for many years, serving the last fifteen as professor. He is also retiring as head of the department of medicine at Georgetown University Hospital and of Gallinger Municipal Hospital.

GEORGIA

Pediatric Meeting.—The Georgia Pediatric Society will hold its annual meeting in Atlanta, December 13. Among the speakers will be Drs. Carl H. Smith, New York, on "The Recognition of the Mild Case of Mediterranean (Cooley's) Anemia"; Helen B. Taussig, Baltimore, "The Management of Patients with Acute Rheumatic Fever," and Ernest C. Faust, Ph.D., New Orleans, "Diagnosis and Treatment of the Intestinal Parasites of the Southern Child." The secretary of the Medical Association of Georgia, Dr. Edgar D. Shanks, Atlanta, and the president of the Fulton County Medical Society, Dr. Joseph C. Massee, both of Atlanta, will speak.

Faculty Changes at Emory.—Dr. William C. Warren, associate professor of clinical otorhinolaryngology and chief of the clinical department, Emory University School of Medicine, Atlanta, has been appointed professor of otology and rhinology and chairman of the department to succeed Dr. James C. McDougall. Dr. Robert M. Paty, Porterdale, has been named professor of surgery and acting head of the department. He will continue as associate dean of the medical school. Dr. Russell Oppenheimer, who recently retired as dean of Emory University School of Medicine, Atlanta, has returned to the school after a three months leave to take over his activities as full time professor of clinical medicine. Dr. Francis P. Parker has returned to the school as assistant professor of pathology, the position which he held prior to entering military service three years ago.

ILLINOIS

Society Breaks Ninety-Nine Year Old Precedent.—For the first time in the ninety-nine years of the Aesculapian Society of Wabash Valley, the group met for its annual meeting elsewhere than in Paris. The meeting was held in Danville October 25. Among the speakers were Drs. Arthur R. Brandenberger, Danville, on "The Use and Abuse of Penicillin," and John T. Belting, Charleston, on "Indications and Some Technics for Open Reductions of Fractures."

Chicago

Implications of the Atomic Bomb.—Capt. Edward L. Bortz (MC), U.S.N.R., will discuss "Implications of the Atomic Bomb" before the North Side Branch of the Chicago Medical Society, December 6, in the Drake Hotel.

Personal.—Dr. Max Cutler, director of the Chicago Tumor Institute, has been named an honorary member of the Cuban Radiological Society.—Dr. Frederick Tice has resigned as president of the board of directors of the City of Chicago Municipal Tuberculosis Sanitarium.

Annual Meeting of Institute of Medicine.—Dr. William C. Danforth, professor of obstetrics and gynecology, Northwestern University Medical School, will deliver the presidential address before the thirtieth annual meeting of the Institute of Medicine of Chicago, December 4, in the Grand Ball Room of the Palmer House. His subject will be "The Beginnings of Asepsis: The Story of a Tragic Life."

Research Fellowships at Illinois.—The Graduate School of the University of Illinois has established four research fellowships to be awarded for one year in the fields of medicine, dentistry and pharmacy at a stipend of \$1,200 a year (calendar year with one month's vacation). Fellows are eligible for reappointment in competition with the new applicants. Candidates should indicate the field of research in which they are interested and submit complete transcripts of their scholastic credits, together with the names of three former

science teachers as references. Appointments will be announced January 1 or soon thereafter each year. The fellowship year begins September 1. Formal application blanks may be secured from the secretary of the Committee on Graduate Work in Medicine, Dentistry and Pharmacy, 1853 West Polk Street, Chicago 12.

KENTUCKY

Bas Relief of Dr. McCormack.—The bas relief of the late Dr. Arthur T. McCormack, for many years secretary of the Kentucky State Health Department and of the state medical association, was exhibited during the recent meeting of the state association. The bronze is the work of Dr. Waller O. Bullock, Lexington, and matches the bronze of Dr. Joseph N. McCormack, father, also a physician who aided in organization of the state board of health, serving as secretary for many years. It will be placed in the State Health Department Building at Louisville as a gift of Dr. Bullock.

State Medical Election—First Distinguished Award.—Dr. Elbert W. Jackson, Paducah, was chosen president-elect of the Kentucky State Medical Association during the annual meeting in Lexington October 31. Dr. J. Watts Stovall, Grayson, was installed as president. Other officers include Drs. Francis Guy Aud, Louisville, John M. Rees, Cynthiana, and Hugh L. Houston, Murray, vice presidents. Dr. William C. Bailey, Harlan, is delegate to the American Medical Association. Dr. Samuel H. Flowers, Middlesboro, was named orator in surgery for the state society meeting in 1946 and Dr. Samuel A. Overstreet, Louisville, orator in medicine. The association voted to raise its dues from \$5 to \$15 a year and recommended that the state legislature be asked to set aside a revolving fund of \$50,000 to \$75,000 for the training of rural doctors. The money would be lent to young men and women who pledged themselves to practice in rural areas and would be repaid by the borrowers. The first award of the association's Distinguished Service Medal (*THE JOURNAL*, May 26, p. 299) was made to Dr. Carl C. Howard, Glasgow, who is credited with starting the movement which led to a state plan for building five tuberculosis hospitals in the state.

LOUISIANA

Prizes to Students.—Dr. Benjamin T. Galloway Jr. recently received the Walter Reed Memorial Medal, given by the Louisiana State Medical Society to the graduate presenting the best thesis either on tropical or on preventive medicine. Dr. Galloway's subject was "Extraintestinal Amebiasis and Its Diagnosis." Other prizes included the Quereens-Rives-Shore Award to Dr. Andreas V. N. Mortensen for his work on "Relation of Hypertension to Vascular Disease," the Jacob C. Geiger medal to Dr. Mitchell Ede for his work on "The Value of Influenza Vaccination" and the Sidney K. Simon Memorial Prize to Dr. Leo E. Johns Jr. for his work on "Regional Ileitis." Dr. Thomas G. Baffes received the Isadore Dyer medal, which is given to the student making the highest combined average for the four years.

MARYLAND

Tuberculosis Campaign Launched.—Health and welfare officials from Maryland, Virginia and the District of Columbia met at Glenn Dale Sanatorium October 25 to organize a permanent conference tending to control tuberculosis in the area. Dr. Herman Hilleboe, medical director in charge of the tuberculosis control division of the U. S. Public Health Service, outlined a "perfect program of tuberculosis control" for a city of Washington's size, major objectives of which include development of research to ascertain needs and facilities, increased case finding work to detect new cases before they are far advanced, sufficient beds, closer cooperation between welfare and health agencies in order to solve social and economic problems, which often block possible cure, and an extension and expansion of the rehabilitation program.

Faculty News.—Lieut. Col. Walter L. Kilby, after an absence of more than three years overseas with the 142d General Hospital, has returned and resumed his duties as professor of roentgenology in the University of Maryland School of Medicine and director of the department of roentgenology in the University Hospital. Col. Walter D. Wise recently was released from active duty with the armed forces and has resumed his position as a professor of surgery at the University of Maryland and chief of staff of the Mercey Hospital, Baltimore. Colonel Wise served for sixteen months as medical director of the Maryland State Selective Service and from August 11 until relief from active duty as consulting surgeon for the Third Service Command. Lieut. Col. Daniel

James Greiner has returned from more than three and one-half years overseas as a member of the 142d General Hospital in the Fiji Islands, on Bougainville and in Calcutta, India, to take up his position as associate professor of pathology at the medical school. Major Harry M. Robinson Jr., who served with the 142d General Hospital, has returned to his position as assistant professor of dermatology. Dr. Frederick B. Mandeville, for eleven years professor of radiology at the Medical College of Virginia, Richmond, Va., has been appointed an associate professor of roentgenology at the medical school.

MICHIGAN

Battle Creek Sanitarium Litigation Ends.—After two years of litigation between the Battle Creek Sanitarium and the Seventh Day Adventist General Conference, a decree was entered in Calhoun County, Mich., November 6, in accordance with a compromise settlement. The Battle Creek Sanitarium emerges from this settlement under the old name of "The Battle Creek Sanitarium and Benevolent Association," free of all legal contacts with the Seventh Day Adventists. Following the sale of the main building of the Battle Creek Sanitarium to the government for conversion into the Percy Jones Hospital, patients were transferred to buildings across the street owned by the Race Betterment Foundation. The Seventh Day Adventists' General Conference laid claim to this money and the sanitarium itself, including some \$675,000 of the assets remaining after the expense of moving. The litigation was begun March 31, 1943 by Dr. John H. Kellogg. The final decree gave to the Adventists cash and some farms in Battle Creek Township in full settlement of all final and other claims against the sanitarium. A new institution called the "Michigan Sanitarium, Incorporated," with headquarters in Berrien Springs, Mich., has been established by the Adventist group. The new Battle Creek Sanitarium and Benevolent Association now operates the Battle Creek Sanitarium and has reportedly some 260 patients now in residence.

MISSOURI

William Sauer Honored on Retirement.—Dr. William E. Sauer, professor of otolaryngology at St. Louis University School of Medicine since 1925, was on account of his recent retirement awarded the Distinguished Service Professorship, the first appointment of its kind. Dr. Sauer has been director of the department of otolaryngology since 1925. He will be succeeded as director by Dr. Bernard J. McMahon, St. Louis, associate professor in the department. Other changes in the medical school include the appointment of Dr. Joseph A. Hardy, assistant professor of gynecology and obstetrics, as director of the department, filling the vacancy left by the recent death of Dr. William H. Vogt. Dr. Garold V. Stryker, assistant professor of dermatology, was named director of the department to succeed Dr. Joseph Grindon, who resigned in 1944 because of age.

NEW JERSEY

Committee Named to Study "Crippling" Diseases.—The New Jersey Crippled Children's Commission has appointed a fact finding committee to study the hospital and convalescent care facilities in the state and to recommend a plan to provide better care for victims of infantile paralysis and other crippling diseases. Arthur H. Moore, ex-governor of New Jersey, will head the committee, representing the public at large. Other members include Albert Leon, chairman of the commission; Dr. Jesse L. Mahaffey, Camden, representing the state board of health; Dr. Frederick G. Dilger, Hackensack, representing the state medical society, and Mrs. Gertrude Miller Buch and William C. Cope, acting director and secretary, respectively, of the crippled children's commission.

Nichols Medal Goes to Wendell Stanley for Virus Work.—Wendell M. Stanley, Sc.D., biochemist and member of the Rockefeller Institute for Medical Research, Princeton, is the recipient of the 1946 William H. Nichols Medal of the New York section of the American Chemical Society. The medal, which will be presented in March, was awarded to Dr. Stanley for his work in the chemistry of viruses. According to an announcement, Dr. Stanley upset the prevailing belief as to the origin of disease in 1935 when he announced that he had isolated in crystalline form a disease-producing virus and had used it to reproduce the disease. By thus showing that infectious diseases are not necessarily caused only by micro-organisms and their toxins, as had been generally supposed, he opened a new field of investigation in the fight to provide immunity against such maladies as influenza, infantile paralysis, encephalitis and the common cold.

NEW YORK

Patients to Receive Free X-Rays at Rochester General Hospital.—Beginning January 1 a chest x-ray examination will be given without charge to every patient admitted to the Rochester General Hospital. The films will be examined by a hospital radiologist and the results reported to the patient's physician.

Clinic for Rheumatic Fever.—A clinic for rheumatic fever will be opened in Rochester under the sponsorship of the Monroe County Medical Society, the city health bureau, the state department of health and the University of Rochester School of Medicine and Dentistry. The clinic will be conducted at the Rochester Municipal Hospital and will be opened to areas outside the city. Patients will be referred through private physicians. The clinic will be set up to diagnose and study rheumatic fever. Personnel for the clinic will be provided by all four of the sponsoring groups. A full time nurse to study home conditions of rheumatic patients, a secretary and several technicians will be contributed by the state department of health, and the city health bureau will supply clinic facilities and additional personnel. A committee of physicians of the Monroe County Medical Society will work in conjunction with the public health officials.

Personal.—Dr. Roy E. Reed, Fayetteville, was recently appointed health officer for the town of Manlius to succeed Dr. George J. Bryan, who will continue to serve as health officer for the village of Fayetteville, it is reported.—Dr. Frank E. Coughlin, district state health officer at Albany, has been appointed a member of the state board of medical examiners, succeeding Dr. Paul B. Brooks, Albany, whose term expired July 31.—Dr. Burtis B. Breese Jr., Rochester, has been named deputy health officer of the Rochester Health Bureau. The appointment will be effective about January 1. According to the Rochester *Times-Union*, October 19, Dr. Breese is the first of two new officers to be appointed to positions in the health bureau. He will be concerned chiefly with communicable diseases. A second health officer, who will specialize in venereal diseases, will be appointed later. Dr. Norris G. Orchard, Rochester, deputy city health officer for the last eighteen years, retired October 15 to enter private practice on Cape Cod.

New York City

The Brickner Lecture.—The twelfth Walter M. Brickner Lecture will be given at the Hospital for Joint Diseases, December 15, by Dr. Cecil K. Drinker, professor of physiology, Harvard Medical School, Boston. Dr. Drinker's subject will be "Physiology of Immobilization and the Local Effects of Heat and Cold."

Cerebral Palsy Demonstration Center Planned.—The establishment of a demonstration center in New York for the study of cerebral palsy and the treatment of spastics and children otherwise affected by injury to the brain is under consideration by the Pediatric Foundation. A campaign to raise \$1,000,000 to finance the project was launched October 2 at a meeting of the foundation in the Hotel Carlyle. The Pediatric Foundation was organized in 1944 as a nonprofit membership corporation to encourage greater use of established work for mental and physical health in early childhood (*THE JOURNAL*, February 24, p. 474).

Howard Rusk Joins New York Times Staff.—Dr. Howard A. Rusk, who recently resigned from the Army to serve as consultant on physical rehabilitation for the Baruch Committee on Physical Medicine, has joined the staff of the New York *Times* and will contribute articles dealing with every phase of the country's problems of "human reconversion." Beginning in December, Dr. Rusk will write on the needs and tasks of the thousands of service men now facing readjustment to civilian life. At a later date his articles will take up the rehabilitation of war workers and other civilians whose lives were radically affected by the war.

Lenox Hill Hospital Affiliates with New York University.—A teaching affiliation has been established between the New York University College of Medicine and Lenox Hill Hospital. The program will be established on the graduate and postgraduate level, as well as on the undergraduate level. For some years undergraduate elective courses have been given at Lenox Hill by the directors of the surgical services, Drs. Carl Eggers, John C. A. Gerster, Otto C. Pickhardt and DeWitt Stetten, who also hold the posts of clinical professors of surgery at New York University. In addition, the cardiac clinic at Lenox Hill, under the direction of Dr. Clarence E. de la Chapelle, assistant dean of the New York University College of Medicine, has been utilized for elective work in the junior and senior years. The new affiliation also makes possible the extension of undergraduate teach-

ing to other departments of the hospital. On the graduate level, internships, residencies and also fellowships which may be established at the hospital will carry with them eligibility for additional training in the basic sciences at the college. Opportunities for physicians already engaged in practice will also be possible through lectures, clinics and demonstrations and other forms of such courses. These are being planned by the medical board of the hospital. The medical board of Lenox Hill Hospital has created a committee on medical education to serve as the liaison between the college and the hospital in the establishment of the teaching program. Quite a number of the members of the Lenox Hill staff are already members of the New York University College of Medicine faculty, and officials of both institutions predict that this number will be increased appreciably in the coming year.

NORTH CAROLINA

State Board Acts to Expedite Licensure.—The North Carolina Board of Medical Examiners has decided to call its members together every three months during the next year to expedite the entrance of qualified medical veterans into practice, particularly for licensure by endorsement of credentials.

Changes in Health Officers.—Dr. Harold C. Whims, Newton, health officer for Catawba County, has resigned to become health officer of Buncombe County with headquarters in Asheville.—Dr. Zack P. Mitchell, Shelby, health officer of Cleveland County, has been named health officer of Iredell County.—Dr. Hamilton W. Stevens Jr., Jacksonville, is the new health officer of Wilson County, succeeding the late Dr. Wade H. Anderson, Wilson.

PENNSYLVANIA

Loan Fund Totals \$65,000.—The Veterans' Loan Fund in Pennsylvania, contributed by members of the Medical Society of the State of Pennsylvania to help members of the component county medical societies returning from World War II military service, totaled \$65,032 on October 17.

Philadelphia

Blood Bank Named for Physician Who Died in Action.—Nazareth Hospital has dedicated its newly formed blood bank in memory of Capt. Leonard J. McGee, M. C., a former intern, who was killed in action in Germany on March 24 while serving as battalion surgeon of the 194th Glider Infantry, 17th Airborne Division, according to *Philadelphia Medicine*.

Thousands for Surgical Research.—Dr. Theodore L. Chase, a retired Philadelphia surgeon, now living in Reno, Nev., has given \$450,000 to Temple University School of Medicine to establish and endow a surgical research foundation, with special emphasis on cancer, it was announced November 12. The gift was made by Dr. Chase in memory of his late wife, Dr. Agnes B. Chase, a native Philadelphian, who graduated at Temple University School of Medicine in 1919. At the request of Dr. Chase, who practiced surgery in Philadelphia for thirty-five years, "the efforts of the Agnes Barr Chase Surgical Research Foundation are to be directed to research in general surgery with the particular emphasis on the study of the cause or causes and treatment of cancer." Laboratories will be set up in the medical school, while clinical application will be pursued in the Temple University Hospital.

TEXAS

Randall Hall.—On the opening of the fall session of the University of Texas Medical Branch, Galveston, the auditorium of the Out-Patient Clinic Building was named Randall Hall in honor of Dr. Edward Randall (1860-1944) who served as professor of materia medica and therapeutics from 1891 to 1929, when he became professor emeritus and chairman of the board of regents of the University of Texas.

Grants for Research.—Sharp & Dohme, Inc., Glen Olden, Pa., have given a grant to the department of pediatrics of the University of Texas Medical Branch, Galveston, for study of sulfonamide drugs in the control of intestinal infections. The grant is to be administered by Dr. Arild E. Hansen, Galveston, professor of pediatrics and director of the child health program, with the cooperation of Dr. Edgar J. Poth, Galveston, professor of surgery, and director of the laboratory of experimental surgery, and MacDonald Fulton, Ph.D., Dallas, visiting professor of pediatric research. The Sugar Research Foundation, Inc., of New York City has made a grant of \$1,000 to support research under the direction of Wilbur A. Selle, Ph.D., Galveston, professor of physiology, University of Texas Medical Branch, Galveston, on the influence of carbohydrates on experimental liver cancer. The John and Mary

R Markle Foundation has granted \$7,000 to continue the support for two years of the study of filariasis under the direction of James Allen Scott, ScD, associate professor of epidemiology and medical statistics, at the medical school

GENERAL

Lectures on Motor Anomalies Available—Because of demand a third printing of Alfred Bielschowsky's "Lectures on Motor Anomalies" is now on sale at Dartmouth College Publications, Hanover, New Hampshire, at \$1.50 per copy, postpaid

Mayo Clinic Flight—Northwest Airlines announces an additional daily flight from Chicago to Rochester, Minn., which has been designated the Mayo Clinic flight. The additional trip brings to four the number now operating from Chicago to the home of the Mayo Clinic under the auspices of Northwest Airlines

Abraham Flexner Heads Scientific Sponsors of Proposed Palestine Medical School—Dr. Abraham Flexner, Princeton, N. J., formerly director of the Institute for Advanced Study, Princeton, N. J., has been named head of a committee of scientists to sponsor the establishment of the Hebrew University-Hadassah Medical School on Mount Scopus, Jerusalem (THE JOURNAL, October 27, p. 643). Hadassah and the Hebrew University are being guided in the planning for the medical school by a medical reference board

Friedenwald Medal Goes to Lewis Cole—The Julius Friedenwald Medal, which is presented annually by the American Gastroenterological Association, has been awarded for 1945 to Dr. Lewis G. Cole, White Plains, N. Y. Dr. Cole, who for a number of years was professor of roentgenology at Cornell University Medical College, New York, has, among other research, carried on extensive work on the differential diagnosis of gastric ulcer and cancer of the gastrointestinal tract. He graduated at Columbia University College of Physicians and Surgeons in 1898

Winners in Modern Hospital Contest—In the essay competition on "A Plan for Improving Hospital Treatment of Psychiatric Patients," offered by *Modern Hospital*, first prize of \$500 has been awarded to Lieut. (jg) Lester Lee Hasenbush, USNR, and his wife, Grace Hasenbush, a graduate social worker, as co-authors. Dr. Hasenbush graduated at the Johns Hopkins University School of Medicine, Baltimore, in 1938. Gerard Victor Haigh, attendant at Norwich State Hospital, Norwich, Conn., won second prize of \$350, and third prize of \$150 went to Dr. Kurt R. Eissler, captain, medical corps

Southern Hospital Council Formed—Representatives of hospitals in several Southern states met informally in Cincinnati during the sessions of the Southern Medical Association, November 12-15, and formed the "Southern Hospital Council." The object of the organization is to provide an opportunity, once a year for discussion of mutual problems by doctor and lay hospital managers and administrators in the South. Meetings will be held annually on the Sunday preceding the opening session of the Southern Medical Association. A temporary organization was set up which includes Dr. Robert J. Wilkinson, Huntington, as chairman, and Dr. Hamilton W. McKay, Charlotte, N. C., secretary

Meetings on Clinical Research—Sectional meetings of the American Federation for Clinical Research have been announced as follows:

Southern Section, Hotel Baltimore, Atlanta, December 8
Eastern Section, Philadelphia General Hospital, December 8
Far Western Section, Salt Lake General Hospital, Salt Lake City, December 28-29

On November 1 in Chicago Dr. Frederick W. Hoffbauer, Minneapolis, was elected chairman of the Mid-Western Section of the federation and Dr. Kenneth G. Kohlstedt, Indianapolis, secretary. Dr. Charles H. Wheeler Jr., New York, is president of the American Federation for Clinical Research and Dr. Richard H. Lyons, University Hospital, Ann Arbor, Mich., secretary

Manufacturers' Award Goes to Rockefeller Institute—On December 10 special ceremonies will be held at the Waldorf-Astoria Hotel, New York to present the seventh Annual Scientific Award of the American Pharmaceutical Manufacturers' Association to the Rockefeller Institute for Medical Research. Alan Valentine, LL.D., president, University of Rochester, Rochester, N. Y., will give the presentation address on "Fundamental Research in Medical Sciences—Its Essential Importance to Public Health" and Dr. Herbert S. Gasser, director of the Rockefeller Institute for Medical Research, will

give the speech of acceptance. The institute was selected for the award "in recognition of its great contributions to public health, by fundamental research in the field of the medical sciences, which is of profound and lasting value to mankind." Other speakers on the program will include:

Dr. John G. Gibson II, Boston, Progress in Blood Therapy
Dr. James A. Shannon, New York, Progress in Antimalarial Therapy
Selman A. Waksman, Ph.D., New Brunswick, N. J., Progress in Antibiotic Therapy

George R. Cowgill, Ph.D., New Haven, Conn., Progress in Vitamin Therapy

Dr. Sidney C. Madden, Atlanta, Ga., Progress in Amino Acid Therapy

Dr. George W. Thorn, Boston, Progress in Hormone Therapy

Industrial Medicine and Surgery Meeting—The mid-winter meeting of the Central States Society of Industrial Medicine and Surgery will be held December 7 at the Palmer House, Chicago. Among the speakers will be:

Dr. Urban E. Gebhard, Milwaukee, Management of Industrial Fractures

Dr. Edwin W. Ryerson, Chicago, Painful Conditions About the Shoulder Joint

Dr. Leonard F. Weber, Chicago, Industrial Dermatoses

Major Frederick C. Reynolds, M. C., and Capt. Charles E. Stebbins, M. C., Chicago, Early Closure of Chronic Osteomyelitis with Split Thickness Skin Grafts

Dr. Earl A. Irwin, Detroit, Psychosomatic Consultations in Industry

Dr. Milton H. Kronenberg, Peoria, Ill., Reemployment of the Physically Handicapped Veteran

The morning will be devoted to a clinical session at St. Luke's Hospital

Government Services

Farewell Reception in Honor of Dr. Dunham

A farewell reception was recently held in the office of the Institute of Inter-American Affairs, Washington, in honor of Dr. George C. Dunham, who recently resigned as president of the institute because of ill health (THE JOURNAL, October 13, p. 524)

Medical Library News

The *Army Medical Library News* made its appearance with the November issue, supplanting the former *News Letter*. The *News* has been made possible by the Association of Honorary Consultants to the Army Medical Library. At the recent annual meeting of the association Dr. John F. Fulton, New Haven, Conn., was elected president, Chauncey D. Leake, Ph.D., Galveston, Texas, vice president and Col. Harold W. Jones, Washington, D. C., secretary treasurer

Korean Physicians Arrive for Training

American scientific aid for the people of Korea was inaugurated November 7 at a conference among nine Korean physicians and officers of the Civil Public Health Division of the Army Medical Department. The entire expense of the group while in the United States will be borne by the International Health Division of the Rockefeller Foundation. Flown to the United States from Korea, members of the study group include Drs. Long Woen Whong, Chang Soon Choi, In Ho Chu, Pum Suk Hau, Dong Chul Kim, Myong Gong Choi, Hyong Nai Song, Haing In Paik and Yu Sun Yun. A tenth member, Dr. Chai Chang Choi, left the group at Honolulu because of lack of transportation facilities and was to go directly to the University of Michigan within a few days. The Korean physicians will be trained individually in civil public health, epidemiology, preventive medicine, bacteriology, immunology, parasitology and special health problems of Korea. Three will go to Johns Hopkins University School of Medicine, three to Harvard Medical School and four to the University of Michigan Medical School. In a statement to the press Major Gen. Norman T. Kirk, Surgeon General, United States Army, stated that the purpose of the year's training is "to lay the foundation for a self-sufficient medical service for the Korean nation. For more than thirty years the Japanese have dominated all medical and other scientific work in Korea as well as its national and local government affairs. No Korean has been allowed to serve in a position of responsibility in the nation or in his own community. It is the hope of the Rockefeller Foundation and ourselves that these men will form the nucleus of a new medical service for the people of their country, and if earnestness and enthusiasm are their criteria they will succeed."

Penicillin in Ophthalmology

Professor Arnold Sorsby spoke at the Section of Ophthalmology of the Royal Society of Medicine on penicillin in ophthalmology. Although penicillin is commonly regarded as nontoxic and readily diffusible, these qualities do not apply to its ophthalmologic use. It is possible to give penicillin in daily subconjunctival injections if the total dosage is not more than 500 or 600 units. Professor Sorsby has observed only 1 case of allergic reaction—in an infant with ophthalmia neonatorum; the instillation of a drop of penicillin into each eye caused severe edema of the lids. Penicillin used locally was effective for the organisms in ophthalmia neonatorum. In 98 cases using 2,500 units of penicillin per cubic centimeter there were 78 cures, 13 relapses and 7 failures. The frequency of instillation as well as the concentration used was important. When penicillin was applied at intervals of an hour the results were good; at intervals of half an hour they were better, at intervals of five minutes better still. For technical reasons it was not possible to institute the constant drip, and Professor Sorsby now uses the procedure of instilling penicillin at intervals of one minute and in most cases the condition is under control within half an hour.

Penicillin has been used in a variety of eye conditions. Control of hypopyon ulcer has been obtained with penicillin drops. One would not expect penicillin to be effective in trachoma, as trachoma is a virus infection. Professor Sorsby has used penicillin in 3 cases of trachoma but in only 1, a fresh case, was a good result rapidly obtained. In 1 case of sympathetic ophthalmia the result was not encouraging. In iridocyclitis the results reported were not significant. Penicillin is a powerful agent but a limited one. It does not readily penetrate into the eye. As a local application in external infections it was of extreme value. Unlike the sulfonamides, it is not inactivated by pus and so can be used locally where the sulfonamides fail. But in intraocular inflammation the sulfonamides have not proved beneficial, and penicillin was not likely to be helpful either.

Bronchopneumonia with Radiologic Diagnosis of Tuberculosis

A case of bronchopneumonia radiologically diagnosed as tuberculosis is recorded in the *Clinical Proceedings of Cape Town Postgraduate Medical Association* by Major S. K. Montgomery. A native soldier aged 26 was admitted to a military hospital on July 12, 1944 with a provisional diagnosis of asthma and chronic bronchitis. For nine months he had had frequent bouts of tightness of the chest and wheezing lasting for a few weeks. He had lost weight and energy and had night sweats. He later gave a history of hemoptysis in 1943, for which he had been treated in a military hospital. For two years previous to his enlistment he worked underground in a coal mine. Since February 1942 there had been cough, producing a small amount of sputum.

On examination the temperature was 99.8 F., the pulse rate 108 and the respiratory rate 24. There were multiple scattered rhonchi in both lungs, mainly expiratory. There was no bronchial breathing. From July 12 to 20, 1944 there was moderate pyrexia, which then subsided. Hemoptysis was observed on July 12 and 22. Night sweats also occurred. X-ray examination on July 17 revealed that the diaphragm moved freely. In all zones of both lungs there was soft confluent infiltration with cavities visible on the screen in the right lower zone and the left upper zone. The appearance was very suggestive of bilat-

eral pulmonary tuberculosis. The sputum examination was negative for tubercle bacilli. The blood sedimentation rate was 12 mm. in one and one-half hours. On August 28 there were numerous rales and rhonchi throughout both lungs and the patient's general condition had greatly improved. X-ray examination revealed that the patchy shadowing seen at the previous examination was no longer present. The lungs appeared normally clear but with some increased vascular shadowing. The examination suggested a catarrhal chest, and there was no infiltration of the type associated with pulmonary tuberculosis.

The case shows how easy it is to mistake simple bronchopneumonia for tuberculosis of a bronchopneumonic type. The diagnosis was influenced by the fact that there appeared to be small cavities on screening. Pseudocavitation has been noted previously in connection with virus or primary atypical pneumonia. On review of the first film it was noted that although there was widespread confluent shadowing in patches throughout both lungs there were no rosette-like infiltrating shadows so typical of pulmonary tuberculosis. In bronchopneumonic pulmonary tuberculosis it is unusual for these to be entirely absent. Their absence should have led to greater caution in the diagnosis of tuberculosis.

Medical Fees

The question of medical fees included in the social security plan has recently been discussed. At a meeting of the representatives of the social security institutions, the ministers of public health, of labor and of national economy and the Physicians' Syndicate the following agreement was reached: The syndicate of physicians shall establish fees, but it must do so in agreement with the regional institutions of social security, which set these fees in their special conventions. These conventions must be ratified by a tripartite commission the composition of which shall be one third doctors, one third representatives of the organizations of social security and one third representatives of the ministers of public health, labor and national economy. If the tripartite commission does not agree with the arrangement concerning the rates of fees arrived at by the doctors and the institutions of social security, it can veto it when necessary in the general interest. In this event it returns the plan to the interested parties without fixing a schedule; the commission is entitled to do this only in the case of a second adjournment.

Charges above the agreed fees are allowed when justified by the services rendered, the standing of the patient and other valid reasons. The protest against overcharges will be submitted to a commission comprising a doctor-inspector and a nonmedical representative of a social insurance institution on the one hand and two representatives of the syndicate of physicians on the other. If the commission finds that there is an abuse, the complaint will be settled by professional jurisdiction. The social security bill has been passed by the Consultative Assembly. The provisional government has approved it and the act appeared in the *Journal officiel*.

Recurrent Fever in North Africa

On July 31 Edouard Benhamou presented to the Académie de médecine a memorandum on the epidemic of recurrent fever now prevailing in North Africa, affecting 50,000 persons, mostly natives. Treatment with neosarsphenamine injected intravenously has given excellent results. Only one injection of 0.6 cc. at the end of the first febrile curve, on about the fourth or the fifth day, is effective and usually prevents recurrent fever. Acetarsone in tablets did not give good results in Tunisia. Durand reports better results with acetarsone in powder, 1 Gm. each morning for four days. Neosarsphenamine is not contraindicated in icteric forms of

recurrent fever. Globulins from convalescents' blood as recommended by Zernati can be preventive and curative, especially when one hesitates to employ neoarsphenamine. In hemorrhagic and neurologic cases transfusion of total or concentrated blood is employed. The author adds that a low mortality has been registered during this epidemic.

By a recent decree of the minister of public health, recurrent typhus has been added to the list of contagious diseases to be compulsorily reported.

BRAZIL

(From Our Regular Correspondent)

RIO DE JANEIRO, Oct. 7, 1945.

Socialization of Medicine

President Getulio Vargas recently signed two decrees of the utmost importance to the practice of medicine and to the social organization of the country. The first decree establishes the minimum sum to be paid to doctors for professional services rendered by them as employees in private medical organizations. The professional services are distributed in many specialties, as for example clinicians, surgeons, radiologists, analysts or hygienists, and several subdivisions, as director, assistant or auxiliary. The same decree states the maximum duration of work, which varies from four to eight hours a day, with a weekly maximum of twenty-four hours and a scale which introduces a basis for variation important to cities and states. The decree specifies that, in cases of disagreement between a private patient and the physician about the sum to be collected for medical care, when the case goes to court and the sum claimed is not more than \$500 the amount demanded shall be considered a definite right of the physician, in accordance with the records on his books. To enjoy this right the physician is obliged to have routine record books with full informative entries in order to make possible the necessary investigations by the judge. This decree for the practice of medicine corresponds to the minimum wage and salary law in labor legislation. In many known cases the federal government and the state and municipal administrations pay their medical employees salaries that are substantially inferior to the minimum established by the new decree.

The second decree is more important than the first. There is no organization in Brazil similar to the American Medical Association, and up to now cases infringing medical ethics have been judged by the local medical societies which are not affiliated with any national or central professional organization. The new decree institutes councils of medicine "to maintain the exact observance of the principles of professional ethics in the practice of medicine." There will be a federal council in the capital of the country and a regional council in every state or federal territory. The regional councils shall be composed of five members elected for three years by the secret vote of the physicians regularly registered in the state or territory. The federal council shall be composed of seven members elected by secret vote for a five year tenure. The principal functions of the councils are (a) to maintain a register of the physicians legally entitled to practice medicine in the state or territory, (b) to judge the cases of infringement of the principles of medical ethics and impose the necessary penalties and (c) to exercise the right of arbitration in the cases in which physicians are involved professionally. The penalties the councils can impose are (a) confidential advertence, (b) confidential reprehension, (c) public reprehension published in the Bulletin of the Medical Syndicate, (d) suspension from medical practice for a period of thirty days and (e) exclusion of the physician from the medical profession, always by a vote of the federal council. From these penalties there can be appeal, without suspensive consequence, to the federal council, except in the case of exclusion of the physician from the medical profession.

This is the only instance in which the appeal shall have suspensive effect. The expenses of this quasijudicial administrative machinery are to be covered by a deduction of 20 per cent of the dues which every physician is obliged to pay as a member of local medical syndicates, which are organizations created by the Brazilian "New State" in the Ministry of Labor. Pending the election and the organization of the federal and the regional councils, the principles of professional ethics in the practice of medicine will be enforced by the regulations contained in the proposed code of medical ethics as it has been approved by the fourth Brazilian Medical Syndicalist Congress. The first federal council will be composed of seven members chosen by the minister of labor from a list of twenty-eight doctors prepared by the president of the Federation of the Medical Syndicates. The minister of labor is in charge of the administration of the decree.

These two decrees, but particularly the second, which created the medical councils, have aroused great opposition and protest from the medical associations and from the leading practitioners of medicine all over the country. Eighteen medical associations in the city of Rio de Janeiro and many from other parts of Brazil have sent telegrams to President Getulio Vargas indicating their disapproval of the decree. The National Academy of Medicine of Rio de Janeiro, the most important medical association of the country, and for many years a kind of "senate" of Brazilian medicine, recorded the publication of the decree and immediately suspended its weekly meeting as a protest. At the next meeting Dr. Pitanga Santos, a leading proctologist of Rio, addressed the academy on the subject, stating that the decree should be considered as having a typical nazi-fascist pattern. Dr. Santos criticized the section of the decree which entitles the minister of labor, who usually is not a physician, to choose the first members of the federal council. Dr. Santos pointed out that the medical profession in Brazil is for the most part composed of law abiding citizens. For the few who may need some disciplinary punishment the "New State" has a handful of special decrees. "What has the minister of labor to do with Brazilian physicians?" exclaimed Dr. Santos.

Among the many physicians of all the states of Brazil who have protested against the creation of these medical councils is Dr. Pedro da Cunha, a professor of medicine at the Fluminense School of Medicine of Niteroi and a popular practitioner in the city of Rio de Janeiro. Dr. Cunha's opinion about the decree has made a deep impression on the medical profession and on the general population as well.

Marriages

JAMES BOND DEALY JR., West Newton, Mass., to Miss Katharine Sumner Lasell in New York, September 15.

JOHN CAMPPBELL O'KEEFE, Albany, N. Y., to Miss Mona Ann Brown of Fieldston, N. Y., September 15.

JOHN WILLIAM FRISTOE JR., Albany, N. Y., to Miss Ruth Sneed Conner of Atlanta, September 21.

WILLIAM BURGETT SMITH, Grand Ridge, Ill., to Miss Jane Hunter in Kansas City, Mo., August 13.

SPENCER W. NORTHUP, Toledo, Ohio, to Miss Virginia Ferris Banting in Maumee, October 6.

JAMES F. PECK, Princeton, Ind., to Miss Mary Evelyn Edgington of Indianapolis, September 1.

JAMES T. NIX JR. to Miss Mary E. Barksdale, both of New Orleans, September 24.

RUDOLPH V. POWELL to Mrs. Vincentia Rehme, both of St. Louis, September 28.

CHARLES EMMETT ROGERS to Miss Frances Barry, both of Milwaukee, July 3.

Deaths

Ralph Charles Matson * Portland, Ore.; University of Oregon Medical School, Portland, 1902; born in Brookville, Pa., Jan. 21, 1880; associate clinical professor of medicine and surgery at his alma mater, where he had been a member of the executive faculty and co-director of the tuberculosis clinic; specialist certified by the American Board of Internal Medicine; member of the Pacific Coast Surgical Association, Portland Academy of Medicine, Pacific Interurban Clinical Club, American Association for Thoracic Surgery, American Trudeau Society, Oregon State Tuberculosis Society and the American Clinical and Climatological Association; member of the executive committee of the International Artificial Pneumothorax Association; honorary member of the Minneapolis Surgical Society, Kansas City Southwest Clinical Society, Eastern Oregon District Medical Society and the Hollywood Academy of Medicine, Los Angeles; past president of the American Sanatorium Association; member of the board of regents of the American College of Chest Physicians, which he served as president 1939-1940 and in 1941; director and formerly vice president of the National Tuberculosis Association; formerly vice president of the Pan Pacific Surgical Association; fellow of the American College of Physicians and the American College of Surgeons; fellow of the International College of Surgeons in Geneva in 1937; delegate to the International Union Against Tuberculosis in Washington, D. C., in 1908, Rome in 1912 and Lausanne, Switzerland, in 1923; vice chairman of the thoracic section of the seventh cruise congress of the Pan American Surgical Association in 1938; honorable first lieutenant with the Harvard University Surgical Unit, serving with the British Expeditionary Forces in 1916, a captain in the Royal Army Medical Corps in 1917 and a major in the medical corps, U. S. Army, serving as chief medical examiner and tuberculosis specialist at Camp Lewis from 1917 to 1919 and chief of the medical staff at General Hospital number 21, Denver, 1919-1920; lieutenant colonel, medical reserve corps, U. S. Army, not on active duty; director, department of surgery, Portland Open Air Sanatorium, Milwaukie; chief surgeon, University State Tuberculosis Hospital; attending specialist, chest surgery, Chest Surgical Center, Veterans Administration Facility; chest consultant, Multnomah County Hospital; consulting thoracic surgeon, Doernbecher Memorial Hospital for Children; member, visiting staff, Good Samaritan Hospital; acting assistant surgeon, U. S. Public Health Service, Relief Station; member, specialists' panel, Union Oil Company; a member, associate medical advisory board, National Jewish Hospital, Denver; served as honorary member of the staff of the Lymanhurst School for Tuberculosis in Minneapolis; chairman of the editorial board of *Diseases of the Chest* and on the editorial board of the *Western Journal of Surgery, Obstetrics and Gynecology*; author of numerous articles in English, German and French on the diagnosis, management and medical and surgical treatment of pulmonary tuberculosis and contributor of sections or chapters to books; died October 26, aged 65.

William Walter Young * Atlanta, Ga.; Johns Hopkins University School of Medicine, Baltimore, 1913; professor of psychiatry and neurology at the Emory University School of Medicine; specialist certified by the American Board of Psychiatry and Neurology, Inc.; member of the American Psychiatric Association and the Southern Medical Association, of which he had been chairman of the section on psychiatry and neurology in 1933; on the staffs of the Emory University, Grady and Piedmont hospitals and St. Joseph's Infirmary; served as consultant psychiatrist to the U. S. District Court; served during World War I; died September 7, aged 55, of myocardial infarction.

Henry Mann Silver * New York; Bellevue Hospital Medical College, New York, 1875; fellow of the American College of Surgeons and the New York Academy of Medicine; formerly professor of clinical surgery at the University and Bellevue Hospital Medical College and professor of surgery at the Woman's Medical College of the New York Infirmary for Women and Children; consulting surgeon, Gouverneur Hospital and New York Infirmary for Women and Children in New York and the St. Luke's Hospital in Newburgh; died September 27, aged 94, of senility.

Dominick Francis Aloisio, Herkimer, N. Y.; New York Homeopathic Medical College and Flower Hospital, New York, 1930; member of the American Medical Association; past president of the Herkimer County Medical Society; served as chief of staff of the Memorial Hospital; died at Newport in August, aged 45.

Joseph T. Axline * North Hollywood, Calif.; St. Louis University School of Medicine, 1906; served in the medical corps of the U. S. Army with the Thirty-Sixth division overseas during World War I, returning to this country with the rank of major; retired from the Reserve Corps in 1933 with the rank of lieutenant colonel; on the staffs of the Valley Hospital in Van Nuys and the St. Joseph's Hospital in Burbank; died on Balboa Island August 14, aged 63, of coronary occlusion.

Henry G. Berry, Mount Clemens, Mich.; Detroit College of Medicine, 1886; member of the American Medical Association; emeritus member of the Michigan State Medical Society; on the staffs of St. Joseph Sanitarium and Hospital in Mount Clemens and St. Mary's Hospital in Detroit; died in Canrose, Alta., August 19, aged 80, of diabetes mellitus and myocardial failure.

William Thomas Bradley, Blackton, Ark.; Chattanooga (Tenn.) Medical College, 1903; member of the American Medical Association; died recently, aged 70, of carcinoma of the prostate.

James Charles Brown, Littleport, Iowa.; Chicago College of Medicine and Surgery, 1911; member of the American Medical Association; died July 9, aged 72, of carcinoma of the bowel.

George Vrooman Cochran * Oakland, Calif.; University of California Medical School, San Francisco, 1931; served as a captain in the medical corps, Army of the United States, from May 1942 to May 1944, when he retired because of total permanent disability; died July 2, aged 48, of malignant hypertension.

Edward Merriman Coleman, Clermont, Fla.; University of Louisville Department of Medicine, 1898; member of the American Medical Association; member of the county board of health; served during the Spanish-American War and World War I; died August 4, aged 72, of cerebral hemorrhage and nephritis.

Camille Ogden Driver, Los Angeles.; Rush Medical College, Chicago, 1922; died in the Hospital of the Good Samaritan August 2, aged 48.

William Elliot Foster, Babylon, N. Y.; New York Homeopathic Medical College and Hospital, New York, 1891; member of the American Medical Association; a director of the Babylon National Bank and Trust Company; died August 30, aged 78, of cardiovascular sclerosis.

Ermin Morton Gardiner, Bennington, Vt.; University of Vermont College of Medicine, Burlington, 1912; member of the American Medical Association; on the staff of the Putnam Memorial Hospital, where he died July 26, aged 56, of cerebral thrombosis.

Merritt Jemison Heath * Birmingham, Ala.; Birmingham Medical College, 1913; served during World War I; died August 31, aged 58, of coronary occlusion.

Stanton Hendrick, Oneonta, N. Y.; Albany Medical College, 1892; member of the American Medical Association; for many years on the staff of the Fox Memorial Hospital; died August 10, aged 80, of cardiac thrombosis.

George Platt Hurd, Chula Vista, Calif.; Dartmouth Medical School, Hanover, N. H., 1888; died in San Diego July 11, aged 82, of arteriosclerosis, heart disease and uremia.

Hamner Carson Irwin, Orange, Texas.; University of Maryland School of Medicine, Baltimore, 1905; member of the American Medical Association; at one time a fellow at the Mayo Foundation in Rochester, Minn.; during World War I served as major in the medical corps, British Expeditionary Forces, and was relieved from service in the U. S. Army with the rank of lieutenant colonel; died in the Veterans Administration Facility, Legion, August 6, aged 67, of coronary arteriosclerosis, pulmonary atelectasis and emphysema.

William Earl Janes * Eureka, Kan.; University of Kansas School of Medicine, Kansas City, 1918; secretary of the Butler-Greenwood Counties Medical Society; served as vice president of the Kansas Medical Society; died in the Wesley Hospital, Wichita, July 5, aged 59, of carcinoma of the pancreas.

Arthur Jordan * Seattle; Columbian University Medical Department, Washington, D. C., 1893; veteran of the Spanish-American War and World War I; formerly associated with the U. S. Public Health Service; died July 6, aged 75, of coronary thrombosis.

Charles Aubrey Joy, Wayland, N. Y.; Albany Medical College, 1914; served during World War I; for many years on the staff as senior assistant physician of the Craig Colony in Sonyea; died July 2, aged 60, of coronary thrombosis.

Charles Joseph Kelley, Anselmo, Neb.; College of Physicians and Surgeons, Keokuk, Iowa, 1889; Rush Medical College, Chicago, 1893; died July 3, aged 87, of nephritis.

Allen Edward Kidd, Portland, Ore.; Barnes Medical College, St. Louis, 1905; member of the American Medical Association; served on the faculty of his alma mater; on the staffs of the Hahnemann and Providence hospitals; died July 7, aged 69, of coronary thrombosis.

George Christopher Kieffer, Philadelphia; Jefferson Medical College of Philadelphia, 1900; served during World War I; chief of medical staff, St. Mary's Hospital, where he died August 18, aged 67, of generalized carcinoma.

Herman William Julius Koerper, Columbus, Ohio; Rush Medical College, Chicago, 1912; member of the American Medical Association and the Columbus Obstetrical and Gynecological Society; fellow of the American College of Surgeons; associate professor of obstetrics at the Ohio State University College of Medicine; consulting obstetrician at Mount Carmel and University hospitals; served during World War I; died July 26, aged 57.

Orren W. Loughlen * Puyallup, Wash.; University of the City of New York Medical Department, New York, 1889; died July 15, aged 84, of arteriosclerotic heart disease.

Ralph Lippincott Lutz * Roscoe, Pa.; University of Pittsburgh School of Medicine, 1930; interned at the Presbyterian and Elizabeth Steel Magee Hospitals in Pittsburgh; member of the local school board and of the board of directors of the First National Bank; on the staff of the Charlevoix-Monessen Hospital, Lock Number Four, where he died July 30, aged 39, of thrombosis of the mesenteric veins.

Eugene Pierre Mallett, Hendersonville, N. C.; Long Island College Hospital, Brooklyn, 1889; on the staff of the Patton Memorial Hospital; died August 25, aged 83, of lobar pneumonia and asthma.

Van Newhall Marsh * Painesville, Ohio; University and Bellevue Hospital Medical College, New York, 1899; University of Wooster Medical Department, Cleveland, 1900; in 1938 member of the House of Delegates of the American Medical Association, past chairman of the city board of health; medical examiner for the draft board; died in Ukiah, Calif., July 25, aged 69, of cerebral thrombosis.

CAPT. DONALD WALKER CHEFF
M. C., A. U. S., 1913-1945

CAPT. EARL BOHNERT
M. C., A. U. S., 1914-1944

CAPT. RAYMOND WEBSTER HEGE
(MC), U.S.N., 1901-1945

Charles John Lavery, Aberdeen, S. D. (licensed in South Dakota in 1890); formerly mayor of Fort Pierre; died in St. Luke's Hospital July 20, aged 78, of adenocarcinoma of the prostate.

John McDannell * Nashua, Iowa; Kentucky School of Medicine, Louisville, 1891; on the staff of the Cedar Valley Hospital, Charles City; died in Charles City July 14, aged 75, of uremia and coronary thrombosis.

KILLED IN ACTION

Donald Walker Cheff, Waynesboro, Pa.; University of Nebraska College of Medicine, Omaha, 1937; member of the American Medical Association and the Medical Society of Delaware; interned at the Delaware Hospital in Wilmington; served a residency at the Brandywine Sanatorium in Marshallton, Del.; on the staffs of the Delaware and Wilmington General hospitals, both in Wilmington, Del.; began active duty as a first lieutenant in the medical corps, Army of the United States, on June 20, 1942; promoted to captain on May 1, 1943; had initial training with the 95th Division but was transferred to the 77th Division before going overseas; served as commander of a medical battalion; served with the famous 77th (Statue of Liberty) Division, going to the Pacific with the division; took part in the invasion of Guam and of Leyte, where he was awarded the Bronze Star for heroism in action; awarded the Silver Star medal; killed in action in Ie Jima April 16, aged 32.

Earl Bohnert, St. Louis; Washington University School of Medicine, St. Louis, 1941; served an internship and residency at St. Louis City Hospital; began active duty as a first lieutenant in the medical corps, Army of the United States, on Aug. 25, 1943; promoted to captain; killed in action in the European area June 10, 1944, aged 29.

Raymond Webster Hege * Captain, M. C., U. S. Navy, San Diego, Calif.; University of Cincinnati College of Medicine, 1927; specialist certified by the American Board of Otolaryngology; interned at the U. S. Naval Hospital, League Island, Philadelphia; began active duty as a lieutenant (jg) in the medical corps of the U. S. Naval Reserve, on July 6, 1926; promoted to lieutenant, lieutenant commander and captain; surgeon on Vice Admiral Marc A. Mitscher's carrier flagship, losing his life in the Pacific area when the vessel was hit by Jap suicide planes May 11, aged 43.

Emmett Wood Mead, Castlewood, Va.; Medical College of Virginia, Richmond, 1892; member of the American Medical Association; died July 27, aged 83, of senility.

Charles H. Montgomery * New York; McGill University Faculty of Medicine, Montreal, Que., Canada, 1903; served as chief of staff of the Manhattan Eye, Ear and Throat Hospital and on the staffs of the Bellevue, Harlem and Montefiore hospitals; died July 13, aged 64, of coronary occlusion.

Clifford J. Morris, Dawson Springs, Ky.; Vanderbilt University School of Medicine, Nashville, 1912; at one time assistant superintendent of Western State Hospital in Hopkinsville; chief physician at the state penitentiary at Eddyville; died July 25, aged 60, of heart disease.

Reid Rufus Morrison, Statesville, N. C.; North Carolina Medical College, 1906; served overseas during World War I; assistant physician in the county health department; died in the H. F. Long Hospital July 21, aged 62.

Wallace Welsh Munsie * Decatur, Ill.; Hahnemann Medical College and Hospital of Philadelphia, 1940; interned at the Huron Road Hospital in East Cleveland; on the staffs of the Decatur and Macon County Hospital and St. Mary's Hospital; died July 25, aged 32, of endocarditis.

Logan Skidmore Owen, Hoboken, N. J.; University of Georgia Medical Department, Augusta, 1924; member of the American Medical Association; interned at the Bellevue and

Frederick Eugene Porter * Medical Director, Captain, U. S. Navy, retired, Alhambra, Calif.; Vanderbilt University School of Medicine, Nashville, Tenn., 1901; entered the U. S. Navy on Oct. 10, 1904; retired Sept. 1, 1939 on or after attaining statutory retirement age; fellow of the American College of Surgeons; died Nov. 28, 1943, aged 68, of coronary embolism and chronic interstitial nephritis.

Samuel Jackson Price, Queenstown, Md.; University of Maryland School of Medicine, Baltimore, 1909; member of the American Medical Association; president of the Queen Annes County Medical Society; served during World War I; deputy medical examiner, Queen Annes County; on the associate staff of the Memorial Hospital in Easton, where he died July 25, aged 58, of chronic emphysema and endocarditis.

Carson R. Reed, Natchitoches, La.; Atlanta College of Physicians and Surgeons, 1906; member of the American Medical Association; died in a sanatorium in Shreveport August 4, aged 66.

Edward L. Rolph, Kimball, Neb.; University of Louisville (Ky.) Medical Department, 1892; died August 3, aged 85, of cardiac decompensation.

Henry Wilbur Sager, Marion, Ohio; National Normal University College of Medicine, Lebanon, 1892; on the staff of the Marion City Hospital; died August 27, aged 80, of cardiac decompensation.

CAPT. CHARLES FRANKLIN SAMPEL
M. C., A. U. S., 1910-1945

LIEUT. COMDR. LOWELL G. KRAMAR
(MC), U.S.N.R., 1900-1945

LIEUT. GILBERT H. WOLF
M. C., A. U. S., 1900-1942

Kniekerbocker hospitals in New York; on the staff of St. Mary's Hospital; affiliated with the Hoboken plant of the Bethlehem Steel Corporation; died in New York Hospital July 15, aged 47, of heart disease.

Robert Sommer, Richmond, Maine; Medizinische Fakultät der Universität Wien, Vienna, Austria, 1920; served as resident on the staff of the Mercy Hospital in Hamilton, Ohio; died July 30, aged 50, of coronary thrombosis.

KILLED IN ACTION

Charles Franklin Sampsel * Bristol, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1936; interned at the Philadelphia General Hospital in Philadelphia; began active duty as a first lieutenant in the medical corps, Army of the United States, on Aug. 11, 1942; later promoted to captain; killed in action in Okinawa April 6, aged 34.

Lowell Graft Kramar * Fortuna, Calif.; Stanford University School of Medicine, San Francisco, 1928; interned at the San Francisco Hospital; served as assistant resident at St. Luke's Hospital in San Francisco; past president of the Humboldt County Medical Society and the Humboldt County Tuberculosis Society; member of the

local chamber of commerce and the Rotary Club; began active duty as lieutenant commander in the medical corps of the U. S. Naval Reserve on Nov. 30, 1942; died in the Asiatic area June 21, aged 45, of extreme multiple injuries.

Gilbert Heinsfurter Wolf, New York; Baylor University College of Medicine, Dallas, 1935; member of the American Medical Association and the American Academy of Dermatology and Syphilology; served an internship at St. Mary's Hospital in East St. Louis, Ill., and the Grady Hospital in Atlanta; began active duty as a first lieutenant in the medical corps, Army of the United States, on May 5, 1942; died in enemy action Oct. 9, 1942, aged 42, while aboard ship en route to Iraq.

Correspondence

"EMERGENCIES IN THE ALLERGIST'S PRACTICE"

To the Editor:—Dr. Waldbott's article entitled "Emergencies in the Allergist's Practice" (THE JOURNAL, August 25) will impress practitioners with the value of a working knowledge of allergy. Many doctors perform skin tests without realizing the danger of serious and even fatal consequences of intracutaneous testing. Literal interpretations of skin test findings without clinical survey further deprive patients of foods or materials they should have. Much harm is done by prescribing diets based on allergy tests alone.

On page 1206, paragraph 5, Dr. Waldbott states that "scratch testing material loses its potency relatively soon," which would indicate that intracutaneous extracts are more stable, yet actually the reverse holds true. Glycerinated extracts and powders remain stable for a much longer period than the intracutaneous allergens and furthermore are much safer to use. In addition, the intracutaneous method produces many more false positives, as a result of which persons are separated, as already mentioned, from foods which they may strongly require and for which the all too frequently used vitamins are substituted, with unsatisfactory results.

I disagree on a point which appears firmly entrenched in the literature, namely that the size of the skin test reaction is the guide to the degree of sensitivity and from which schedules of treatments and classifications are made. I regularly see patients with 4 plus skin reaction who can take very high doses, and 1 plus responses in patients able to tolerate only a weak schedule and therefore do not regard the size of a skin test as the key to clinical sensitivity. Only after a few of the early injections, small well diluted doses, slowly raised, with accurate observations of local, focal or constitutional responses can the clinical sensitivity be determined. Severe, repeated constitutional reactions may occur when this method of determining sensitivity is not used. In 1936 I stressed the point "fit the dose to the patient, not the patient to a schedule," and the latter cannot be positively determined by the initial skin test (Engelsher, D. L.: *Allergy in Practice, Ohio State M. J.* 32:1229 [Dec.] 1936).

The lower part of the arm and the forearm are the safest sites for testing, certainly not the back. In case of immediate constitutional reaction, a tourniquet can be easily applied to prevent further absorption, whereas this is impossible on the back and very uncomfortable on the thigh.

When the emergency is that grave and intravenous epinephrine may be indicated, it is safer in my opinion to use a prepared 1:10,000 solution rather than, as Dr. Waldbott states, mixing a 1:1,000 solution with blood, in the syringe, while the needle is in the vein (page 1207, column 1). Neither can an accurate dilution be made, nor is the time propitious for expending even a few seconds in the procedure.

The method of pollen desensitization quoted of W. W. Duke (New Method of Administering Pollen Extract for Purposes of Preventing Reactions, THE JOURNAL, March 15, 1930, p. 767) of adding epinephrine to each injection plus the use of a blood pressure cuff acting as a tourniquet is not logical and is not used by any allergist, to my knowledge, because of the evanescent action of the epinephrine, which could not prevent the later reactions.

Switching from depleted or old extracts to fresh ones accounts for many severe reactions, in spite of following the numerous published (Coca, Walzer and Thommen: *Asthma and Hay Fever in Theory and Practice*, Springfield, Ill., Charles C Thomas, 1931, p. 348) methods of the proportionate mixing of each. I regard this as an erroneous method, because accuracy of the mixed strength of the solution is lacking. My routine is never to have an empty bottle. The upper and lower margins

of my labels on the bottles are the guides. When the fluid reaches the lower margin, fresh extract is added to no higher a level than the upper margin of the label. By this precaution an equalizing pool is maintained through the various extract strengths. Clear labeling and care in using the correct extract and strength are simple facts occasionally overlooked in haste, which will prevent serious reactions.

On page 1208, column 5, Dr. Waldbott aptly mentions deaths from intravenous aminophylline and quotes G. A. Merrill (Aminophylline Death, THE JOURNAL, Dec. 25, 1943, p. 1115). Intramuscular use of this drug will alleviate many an attack, without the dangers of the intravenous route, which latter is used much too frequently and unnecessarily.

From the number of serious consequences which we see, from the use of acetylsalicylic acid and morphine for persons sensitive to these drugs, I feel that many practitioners doubt that such allergies exist. To suspend the cough reflex with morphine not infrequently has a fatal outcome. Thorough questioning on drug sensitivity should form a part of all histories, medical, surgical or specialties, and a prominent designation (I encircle positives in red) used. The surgeon should not hesitate to have an allergic consultation, if the slightest doubt exists, for type of anesthesia, drug and diet recommendations. An aspirin tablet given postoperatively for a "cold" can flare-up an asthma in an aspirin-sensitive patient so severe that a fatality may result. Contrary to Dr. Waldbott's statement (page 1208, column 1, paragraph 4) epinephrine sensitivity does exist to a varying degree. A patient at Fordham Hospital would become transiently disorientated after 2 minims of 1:1,000 epinephrine solution was injected. Many patients develop tachycardia, trembling and paleness from small doses.

Dr. Waldbott omitted two important points in his instructive paper: severe sulfonamide reactions and proper precautions in administration of serum. Sensitivity to sulfonamides may produce extensive angioneurotic edema with occasional edema of the glottis. Deaths from serum injections are well known to the profession. The seven ways to prevent serum reactions were published in THE JOURNAL (Engelsher, D. L.: Serum Administration and Allergy, THE JOURNAL, May 20, 1944, p. 238) after my earlier suggestions in 1936 and 1942.

DAVID LOUIS ENGELSHER, M.D., New York.
Associate Attending Physician in Allergy, Morrisania and Union hospitals; Attending Allergist, Bronx Eye and Ear Infirmary; Chief of Allergy Clinic, Fordham Hospital.

[To Dr. Engelsher's communication Dr. Waldbott replies:]

To the Editor:—The comment by Dr. Engelsher reemphasizes a number of points brought out in my paper. Concerning those on which there is some divergence of opinion, I wish to suggest the following:

1. Glycerinated extracts, which are usually employed for intracutaneous testing, are definitely more stable than the powdered ones, which are most widely in use for scratch testing. False positive reactions occur in both methods of testing. They can easily be recognized after the extract in question has been used a few times.

2. If intracutaneous tests are used (not scratch tests!) the injection of graduated doses of a certain antigen, either directly or by passive transfer, has been by far the most satisfactory method to me of gauging the patient's sensitivity (Waldbott, G. L.: Hay Fever Treatment During the Season, *Tri-State M. J.* 15:2949 [May] 1943).

3. The intravenous method of administering aminophylline is decidedly more effective and prompt in its action than the intramuscular one and therefore far too valuable to be discarded. It is safe if the precautions which are outlined in my paper are followed.

4. Transient disorientation, tachycardia, trembling and pallor are not indications of sensitivity (meaning allergy!) to epinephrine. It cannot be questioned, however, that there is an individual degree of response to pharmacologic action of the drug.

5. Anaphylactic shock from serum as well as from drugs exhibits the same symptomatology and requires the same treatment and prophylaxis as that from pollen injections (Waldbott, G. L.: Prevention of Anaphylactic Shock, with a Study of 9 Fatal Cases, *THE JOURNAL*, Feb. 6, 1932, p. 446; Allergic Shock from Substances Other Than Pollen and Serum, *Ann. Int. Med.* 7:1308 [April] 1934). I therefore did not elaborate on it further.

GEORGE L. WALDBOTT, M.D., Detroit.

THE USE OF TOURNIQUETS

To the Editor:—The paper by Speigel and Lewin in *THE JOURNAL*, October 6, contributes valuable information on the neglected subject of tourniquets, which admittedly was not fully settled by my research because of obstacles encountered. The following remarks may assist toward clarifying some points:

1. The described nerve lesions were evidently not due to asphyxia within the time (one and one-half hours) mentioned by the authors but were evidently due to direct pressure. The location of neuromas and other details indicate that the tourniquet application was of the old-fashioned kind, namely a rather broad tube of poor elasticity wrapped two or more times around the limb in separate turns. This method combines the evils of narrow and of broad tourniquets. My use of a narrow, highly elastic tube in two superimposed turns is not customary and has never been proved to cause permanent paralysis or contracture.

2. The narrow tourniquet is apt to crush nerves against bone in exposed locations, in the arm and to a less extent in the lower part of the leg. Precautions may consist in choosing the safest place for a tourniquet and placing small pads to guard endangered nerves. Granting that a broad tourniquet is more sparing of nerves within certain time limits, animal experiments show that if the time is long enough for damage to be caused by the broad band it is more severe and lasting than with the narrow band. For a valid therapeutic reason, I once placed a narrow tourniquet for seven hours below the knee of a man in Dr. Crossman's service; the inevitable paralysis was almost gone within three months, but with a broad tourniquet it would probably have been permanent. Crushing by a narrow tourniquet is like surgical section of a nerve followed by immediate suture. By an interesting coincidence, in that same issue of *THE JOURNAL* (p. 484) there is a recommendation of crushing the phrenic nerve with a mosquito hemostat as a recognized means of establishing temporary paralysis. Extended crushing, as by a broad tourniquet, would cause necrosis and fibrosis over such a length as to block regeneration permanently.

3. Refrigeration is the most powerful means of preventing or reducing damage from any kind of pressure and also from asphyxia. Examples: no paralysis or thrombosis in the many amputations under refrigeration anesthesia; only temporary paralysis of animals' legs after fifty-four hours of refrigeration with a narrow tourniquet. There seems to be no excuse for operating on a limb with a tourniquet without refrigeration. Cases such as those cited by Speigel and Lewin enlarge the list of disabilities and deaths resulting from the lack of official adoption of this method, which I began to publish in 1937. Balanced against the advantages of the broad tourniquet or padding with a towel, and against the greater advantages of pneumatic pressure, is the pronounced insulation thus introduced. The protection of a wide zone of tissue from cold is a difficulty which has not been solved and which stands as the strongest argument against broad tourniquets.

FREDERICK M. ALLEN, M.D., New York.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

EXAMINING BOARDS IN SPECIALTIES

Examinations of the Examining Boards in Specialties were published in *THE JOURNAL*, Nov. 24, page 906.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Mar. 19-21. Sec. Dr. B. F. Austin, 519 Dexter Ave., Montgomery 4.

COLORADO: * Denver, Jan. 1-5. Final date for filing application is Dec. 17. Sec., Dr. J. B. Davis, 831 Republic Bldg., Denver.

DELAWARE: Examination, Dover, Dec. 12. Endorsement, Dover, Dec. 19. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

IDaho: Boise, Jan. 15. Dir., Bureau of Occupational Licenses, Miss Agnes Barnhart, 355 State Capitol Bldg., Boise.

KANSAS: Topeka, Dec. 6. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. Seventh St., Kansas City 10.

KENTUCKY: Louisville, March 25-27. Sec., State Board of Health, Dr. Philip E. Blackerby, 620 S. Third St., Louisville 2.

MAINE: Jan. 23-25. Sec., Board of Registration of Medicine, Dr. A. P. Leighton, 192 State St., Portland.

MARYLAND: Medical, Baltimore, Dec. 11-15. Sec., Dr. J. T. O'Mara, 1215 Cathedral St., Baltimore. Homeopathic, Baltimore, Dec. 11-12. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

NEW JERSEY: Trenton, June 18-19. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

NEW MEXICO: * Santa Fe, April 8-9. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.

NEW YORK: Jan. 28-31. Sec., Dr. Jacob L. Lochner, Education Bldg., Albany.

NORTH CAROLINA: * Raleigh, Dec. 29. Final date for filing application is Dec. 19. Sec., Dr. Ivan Procter, Raleigh.

NORTH DAKOTA: Grand Forks, Jan. 1. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OHIO: Endorsement, Columbus, Jan. 8. Examination, Columbus, March 19-22. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, March 23. Sec., Dr. J. D. Osborn Jr., Frederick.

OREGON: * Jan. 23-26. Exec. Sec., Miss L. M. Conlee, 608 Falling Bldg., Portland 4.

PENNSYLVANIA: Harrisburg, January. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

RHODE ISLAND: * Providence, Jan. 3-4. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH DAKOTA: * Pierre, Jan. 15-16. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, Capitol Bldg., Pierre.

TEXAS: Austin, March 27-29. Sec., Dr. T. J. Crowe, 918-20 Texas Bank Bldg., Dallas 2.

VERMONT: Burlington, March or April 1946. Sec., Dr. F. J. Lawless, Richford.

WASHINGTON: * Seattle, Jan. 14-16. Dir., Department of Licenses, Mr. Harry C. Huse, Olympia.

WEST VIRGINIA: Charleston, Jan. 7-9. Commissioner, Public Health Council, Dr. John E. Offner, State Capitol, Charleston 5.

WISCONSIN: * Madison, Jan. 8-10. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Cheyenne, Feb. 4. Sec., Dr. G. M. Anderson, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

IOWA: Des Moines, Jan. 8. Dir., Division of Licensure & Registration, Mr. H. W. Grefe, Capitol Bldg., Des Moines.

MICHIGAN: Ann Arbor and Detroit, Jan. 11-12. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

MINNESOTA: Minneapolis, Jan. 2-3. Sec., Dr. J. C. McKinley, 126 Millard Hall, University of Minnesota, Minneapolis 14.

NEBRASKA: Omaha, Jan. 8-9. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Bldg., Lincoln 9.

OKLAHOMA: Oklahoma City, Jan. 21. Sec., Dr. J. D. Osborn Jr., Frederick.

OREGON: Portland, March 2. Sec., Board of Higher Education, Mr. C. D. Byrne, University of Oregon, Eugene.

SOUTH DAKOTA: December. Sec., Dr. J. D. Alway, Aberdeen.

TENNESSEE: Memphis and Nashville, Dec. 17-18. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis.

WISCONSIN: Milwaukee, Dec. 1. Sec., Prof. Robert N. Bauer, 152 W. Wisconsin Ave., Milwaukee.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Celiac Syndrome: III. Dietary Therapy for Congenital Pancreatic Deficiency. Dorothy H. Andersen.—p. 100.

Nephrotic Hyperlipemia.—Heymann and Clark determine total lipid, total and free cholesterol and phospholipid concentrations in the blood serum of dogs, rabbits and rats which were subjected to bilateral and unilateral nephrectomy or to enteral and parenteral administration of mercury bichloride, uranium nitrate and potassium dichromate. For control purposes the effects of splenectomy, cholecystectomy, sham operations and many other procedures were investigated. The authors conclude that the kidneys of dogs, cats, rats and monkeys are part of a mechanism which influences blood lipid concentration. The hypothesis is advanced that the hyperlipemia found in cases of nephrosis is of renal origin.

Sulfadiazine in Infections of Respiratory Tract.—Siegel studied the clinical effects of continuous oral administration of sulfadiazine on the incidence and severity of acute infections of the respiratory tract in children. The drug was used between August 1942 and April 1944 for periods of four to fifteen consecutive weeks in doses ranging from 0.5 to 2 Gm. daily. The average level of free sulfadiazine in the blood was 3.5 mg. per hundred cubic centimeters with a maintenance dose of 1 Gm. a day, and 7.2 mg. per hundred cubic centimeters with 2 Gm. a day. It was not necessary to discontinue the drug in any case because of serious toxic reactions. The incidence of acute infections of the respiratory tract was almost the same for treated and for control children. The treated patients recovered somewhat more promptly than the controls and experienced fewer complicated illnesses and fluctuations in severity. While the prophylactic use of sulfonamide compounds is of recognized value in certain circumstances, their usefulness is limited by factors pertaining to the host and the infecting agent which are not predictable. If the sulfonamides are used when prevailing conditions are not suitable for successful chemoprophylaxis, there is little additional advantage over prompt therapeutic application.

*Penicillin Treatment of Trachoma: Preliminary Report. D. J. Darius.—p. 1007.

Penicillin in Trachoma.—Darius reports 12 cases of trachoma ranging from type I to the chronic type III treated at the United States Indian Service Hospitals with sodium salt of penicillin in a solution of 500 units to each cubic centimeter of water. Drops of this solution were instilled in the eye every three hours. Improvement was observed under the three hour schedule but more rapid results were obtained under a half hour schedule. Loss of photophobia and lacrimation was noticed in twenty-four to forty-eight hours. Improvement in vision was usually evident on the third day, as was paling and thinning of the hyperemic palpebral conjunctiva, with gradual flattening of follicles and granulation tissue. Beginning shrinking and retraction of vessels of the pannus was definite on the fifth to the seventh day, with accompanying slower clearing of the gray corneal pannus infiltrate. Rapid healing of complicating corneal erosions and ulcers was the most spectacular improvement. The effect is not superior or more rapid than that obtained with sulfanilamide therapy, but penicillin may offer a solution in the treatment of sulfanilamide resistant or sensitive cases.

Tricuspid Insufficiency.—Congenital tricuspid insufficiency of the Ebstein type has been reported only 16 times. Bauer reports the seventeenth case, the fourth instance of sudden death. A woman aged 27, studied on three occasions over a period of nine years, was first seen at the age of 18, when she complained of weakness, easy fatigability and breathlessness in response to minor exertion. The most distressing symptom was "heart flutter." She was seen several times in the outpatient clinic before having an attack of acute gonococcal arthritis involving the right wrist, which occurred at the age of 20. Bouts of palpitation and dyspnea on exertion were then less troublesome because she had learned to accept her physical limitation and was leading a less active life. Teleroentgenograms and roentgenoscopy showed increase of the transverse diameter of the heart during this two year period. At the age of 27 the patient was admitted for study of her cardiac status and consideration of the advisability of oophorectomy. The electrocardiogram showed the same general picture as previously, with normal sinus rhythm and right bundle branch block. The roentgenogram demonstrated enlargement of the right atrium and ventricle. A papillary cystadenoma of the ovary was removed. The postoperative course was satisfactory and the patient was discharged on the twelfth day. She returned for dressings on the twenty-first and twenty-eighth postoperative days. She died suddenly during the last visit to the clinic. The attending physicians believed that death was caused by pulmonary embolism. Postmortem x-ray studies of the heart were compared with teleroentgenograms made during life. The roentgenologic evidences of tricuspid insufficiency were massive enlargement of the cardiac shadow to the right and left in the absence of pulmonary congestion, prominent upper mediastinal shadow with widened superior vena cava, enlargement of the right atrium and ventricle and difficulty in visualization of the small left ventricle.

Cannon's Point in Functions of Colon.—Arendt states that after a barium meal it may be noted that the first part of the transverse and the ascending colon up to a certain point is contracted, while the second part of the transverse colon and the descending colon are of normal diameter. In another group of cases the reverse process may be evident: the ascending colon and the first part of the transverse colon are wide, the second part of the transverse colon and the descending colon are contracted. The earliest observations concerning this phenomenon were made by Cannon, who in experiments on animals described in 1902 a ring of contraction in the large bowel of the cat, which divides the colon into two portions. This point, which is in the proximal mid-third of the transverse colon, is also found in man. It is of clinical and roentgenologic significance and should be called Cannon's point. Arendt's roentgenologic observations indicate that it is the pivoting point of the vagus-pelvicus and of the sympathetic innervation, thus dividing the colon into two distinct neurologic units as far as the extrinsic innervation is concerned. The innervation follows the blood supply. To be visible in roentgenograms, an antagonism between both neurologic units is necessary; if the nerve impulses in the two divisions are the same, no demarcation can be expected; if they are antagonistic, the division is clearly visible. Instead of the antagonism, we sometimes see in the case of overlapping impulses a contraction ring caused by intrinsic nerve impulses. The two units may be harmonious or antagonistic. Spastic contraction of the second unit is a frequent

cause of constipation in the ascending colon and is best treated by antispasmodics. The proper knowledge of the neurologic units is important in differentiation and choice of the operative method of the different types of megacolon.

Powdered Stomach in Treatment of Infantile Pellagra.

—The syndrome which the Gillmans accept provisionally as pellagra in infants is prevalent in Johannesburg, South Africa. Analysis of hospital records during the last four years has revealed that the death rate among children suffering from this disease fluctuates between 40 and 60 per cent. The views held concerning the causes of pellagra suggest that this disease is caused by a lack of vitamin B complex, especially of nicotinic acid. However, vitamins fail to be effective in approximately 50 per cent of the cases. The authors discovered that powdered hog stomach led to rapid improvement in the clinical condition and simultaneously depleted the fat from the liver. In a study of 23 cases of pellagra in infants and children they noted that the main clinical findings were a varying degree of edema, dermatitis, angular and labial stomatitis (cheilosis), graying of the hair with varying degrees of alopecia, steatorrhea and a large fatty liver. Microscopic examination of aspiration biopsy of the liver revealed the presence of fat in the liver cells. The fatty change in the liver was a constant feature and was not due to intercurrent infection. The accumulation of fat in the liver proved to be a more accurate measure for predicting the outcome than the clinical findings. All the patients in this series treated with vitamins died. Liver extract and especially powdered stomach depleted the fat from the liver, and this depletion was invariably associated with a dramatic improvement. Five days' treatment with 10 Gm. of powdered stomach a day was adequate to allow for a continued depletion of fat from the liver even after treatment was suspended. Although infantile pellagra is initiated by dietary imbalance, the secondary pathologic changes which supervene cannot be alleviated by a full diet and vitamin concentrates. The edema of infantile pellagra is not related to the serum proteins but probably results from a disturbance of the gastrohepatoportal mechanism. In view of the low fat content of the diet, the steatorrhea in infantile pellagra was regarded as resulting not from malabsorption of fat but from conversion of carbohydrate to fat which cannot be utilized. The evidence indicates that fat continuously present in the bowel liberates enterogastrone, which in turn inhibits gastric function. In view of the rapid improvement in pellagra treated with powdered stomach, it is recommended that this treatment be given universal trial for other diseases in which steatorrhea is a prominent feature.

Hepatitis With and Without Jaundice.—During the late summer and fall of 1943 an epidemic of infectious hepatitis began among American, British and French troops in the North African theater. A total of 448 patients with jaundice were admitted to the gastroenterologic service of a general hospital in Italy. Jaundice developed also in patients in the surgical wards; 196 patients with hepatitis and jaundice uncomplicated by other diseases, 42 patients having additional diseases simultaneously and 17 patients with hepatitis without jaundice were studied. Finks and Blumberg stress that the clinical characteristics of epidemic hepatitis with jaundice are not essentially different from those of catarrhal jaundice. Epidemic hepatitis is similar to postvaccinal hepatitis but differs in the frequent occurrence of chills, fever and lymphadenopathy and in the relative absence of dermatitis, anemia and mental reactions. Fever, chills and other evidence of an acute infectious, systemic disease are common initial symptoms. The disease is usually mild but has a tendency to relapse with exertion, fatigue and intercurrent infections. Relapses can be prevented or minimized by rest in bed and by a prolonged convalescent period. The disease, although usually benign, may be rapidly fatal. There was one fatality in this group. Repeated severe hemorrhages from ulcerations in the gastrointestinal tract and nephrosis due to deposition of bile pigment in the renal tubules were complications in the fatal case.

Genitofemoral Causalgia.—Lyon adds 3 cases of genitofemoral causalgia to a series of 7 which were reported by McGee in 1942. Lyon's first patient was a farmer aged 18 who complained of severe pain in the right groin of four months' duration. The pain was aggravated by standing, walking, lifting and straining and disappeared when the patient lay down and flexed his right thigh on the abdomen. He had had an appendectomy four years previously. The old appendectomy scar was well healed, not tender or fixed. There was tenderness along the right inguinal canal, especially in the region of the internal ring. The tenderness in this region was so acute that the patient became faint when this area was palpated and stated that this was the exact spot where he felt the maximum amount of pain when walking and standing. A diagnosis of genitofemoral causalgia was made and operation advised. The cecum and terminal ileum were found to be bound down by dense adhesions to the posterior peritoneum over the iliac vessels. These adhesions were freed and the posterior peritoneum was opened. The genitofemoral nerve was identified and lifted up from the psoas muscle where it crossed beneath the ureter. It was followed down. The nerves seemed to be under an unusual tension. Approximately 2 inches of the main nerve trunk was excised and the cut ends were allowed to retract. The convalescence was uneventful and the patient has been free from pain and discomfort since the operation. In the two other cases the author was again impressed with the apparent tautness of the nerve at the region of its exit from the posterior peritoneum and its entrance to the internal inguinal ring and below Poupart's ligament. In none of the 3 patients were the adhesions particularly dense, but the nerves in all 3 were quite taut

even with the patient lying in the supine position. This tension might be increased by hyperextension of the thigh during the act of walking or standing. Sectioning of this nerve is the best method of producing a cure of this most distressing condition.

Treatment of Essential Hypertension with Sodium Thiocyanate.—Beamish and Adamson used Barker's sodium thiocyanate method in the treatment of 10 patients with essential hypertension. Special precautions were taken to eliminate the psychic effects of treatment. Objective and subjective improvement definitely attributable to the action of thiocyanate was obtained in over half of the patients. Blood pressure reductions obtained in all cases averaged 40.5 mm. systolic and 19.8 diastolic. Symptomatic improvement occurred in 6 cases; mild toxic effects occurred in 5. Best results were secured in those with severe symptoms associated with little cardiovascular and renal damage. By proper selection of cases the number of good results could be increased. Dosage must be carefully controlled by blood cyanate determinations, and patients must be watched for toxic manifestations. Severe symptoms or dangerously high pressure, unrelieved by other treatment, indicate the use of thiocyanate.

Detection of Agglutigen A₂.—Young and Witelsky say that although the subgroups A₂ and A-B are rare they may be encountered from time to time in the operation of a blood transfusion service and in the investigation of paternity. They discovered a man with the blood group A₂B in the course of determining the blood groups of medical students. Of all red cells available, A₂B cells give the weakest reactions with B serum and therefore provide the most sensitive testing mediums for this serum. Serum from group B donors vaccinated intravenously with a solution of A and B factors may produce strong agglutination of A₂B cells. Titrations of such a serum serve to emphasize the great advantage of using "immunized"

persons as donors of blood grouping serum. Studies of the subgroups of other members of the family of the A₂B individual revealed that the student's father and both grandmothers belonged to group B, while his mother and all 3 of her siblings belonged to subgroup A₂B and his sister to subgroup A₂. It is most likely that the A₂B student inherited the A₂ agglutinin from the mother, whose genotype is presumably A₂B. These findings might constitute an exception to the currently accepted theory of inheritance of the A₂ agglutinin.

Penicillin Sensitivity of Common Pathogens.—Meads and his associates describe tests on the in vitro sensitivity to commercial penicillin of 240 pathogenic strains of gonococcus, beta and alpha streptococcus, pneumococcus, meningococcus, and staphylococcus and also on 21 respiratory strains of Hemophilus hemolyticus. There were wide differences in sensitivity among these organisms and among different strains of the same organism. The strains of gonococcus and of group A hemolytic streptococcus were the most sensitive to penicillin and showed the greatest uniformity in that respect. The strains of staphylococcus and meningococcus showed the widest range of sensitivity. Most of the H. hemolyticus strains reacted like the majority of staphylococci and meningococci. The sensitivity of strains of pneumococcus and alpha streptococcus was intermediate between that of beta streptococci and meningococci. Resistant strains, which were 256 times more resistant than the reference strain of hemolytic streptococcus, were encountered only among the staphylococci. Relatively insensitive strains, which were from 16 to 64 times more resistant than the reference strain, were found among the staphylococci, meningococci, H. hemolyticus and alpha streptococci. Among the group A streptococci, pneumococci and meningococci there was no correlation between the serologic types and penicillin sensitivity. Among the pathogenic staphylococci there was no apparent relation between penicillin sensitivity and the hemolytic or coagulase properties of the different strains.

Continuous Intravenous Drip for Maintenance of Penicillin Levels.—Loewe and his associates determined penicillin serum levels following fractional intramuscular, continuous intramuscular and continuous intravenous administration of penicillin. They recommend fractional intramuscular therapy for the treatment of acute short lived infections. Injections should be given every two hours. The continuous intravenous drip of penicillin yields serum levels superior to those obtained following continuous intramuscular injection. Predictable serum penicillin levels are obtained following continuous intravenous drip in daily dosage schedules up to 10,000,000 units. Such doses are nontoxic.

Fatal Agranulocytosis from Thiouracil.—Wosika and Braun report a fatal case of agranulocytosis in a woman aged 50 who was given 0.6 Gm. of thiouracil for thirty-one days, 0.4 Gm. daily for fourteen days, 0.2 Gm. for twenty-one days and 0.1 Gm. for ten days, a total dose of 29.4 Gm. The basal metabolic rate was reduced, the pulse rate became slower and no change was noted in the blood count or in the weight. The exophthalmos and general condition improved dramatically. On November 13 her throat was slightly injected and her temperature was 99.6 F. Thiouracil was stopped. The throat condition became worse. On November 15 swelling, redness and a dirty white exudate were observed. The temperature was 103 F. She had become toxic and restless. The white blood cell count was 2,500. No neutrophils were found. The white blood cell count on successive days was 3,000, 1,200 and 500. The patient died on November 19 with a temperature of 106 F. after a deepening coma in spite of receiving daily 40 cc. of pentnucleotide intramuscularly, 6 cc. of yellow bone marrow, 500 mg. of ascorbic acid, 100 mg. of thiamine hydrochloride, a transfusion of 500 cc. of whole blood and 10 units of crude liver extract intramuscularly. She also received a few oral 2 cc. doses of folic acid and 15,000 units of penicillin every two hours for three days and continuous oxygen therapy. Nine cases (including the present report) of agranulocytosis from thiouracil have been reported in detail, in which there were five recoveries and four deaths. The danger of agranulocytosis is apparently increased in patients over 50 years of age. The duration of the treatment, the size of the daily dose and the total of drug consumed do not seem to be determining factors.

Outpatient Penicillin Therapy of Gonorrhea.—The treatment schedule used by Chinn and Gillick consisted of four injections of penicillin of 50,000 units each at hourly intervals. They treated a total of 776 cases of gonorrhea without any toxic reactions. Two cultures forty-eight hours and ten days after treatment were obtained in 589 cases. Patients failing to return for observation were not considered in the evaluation of the method. Cultures were negative in 91.2 per cent of the patients receiving one course of treatment. Among the 52 patients who were considered treatment failures 19 were treated with a second course of 200,000 units. Seventeen of these responded successfully. Blood levels of from 0.19 to 0.25 unit per cubic centimeter of serum were maintained for at least three hours after treatment in 4 cases. The authors conclude that this method is satisfactory as an outpatient procedure in the treatment of gonorrhea.

Chemotherapy for Scarlet Fever Carriers.—Rubenstein and Foley studied the effect of chemotherapy on temporary and convalescent scarlet fever carriers. In two epidemics the utilization of small daily doses of a sulfonamide preparation—sulfamerazine in the first instance and sulfadiazine (Pickrell's solution) in the other—apparently reduced to a minimum the number of persons carrying the causative organism. Studies among the families of children who acquired scarlet fever in a schoolroom outbreak revealed a spread of the causative organism to a large proportion of the family contacts, with the occurrence of several secondary cases. A study of a group of untreated scarlet fever patients showed that when discharged from isolation hospitals the majority carried the same type of streptococcus that was present on admission. A large proportion of scarlet fever patients treated with certain of the sulfonamides developed a temporary period of "cultural latency." In approximately half of these cases, however, the original streptococcus reappeared in the cultures after an interval of one to five weeks. A study of sulfathiazole treated cases suggests that the period of "cultural latency" has no effect on the incidence of late secondary cases.

Silicosis.—The addition of as little as 1 per cent of aluminum dust to silica laden air is sufficient to prevent the development of silicosis in the experimental animal. It was not necessary to inhale both the silica and the aluminum simultaneously in order to protect the animal against experimental silicosis. When studying the application of this preventive measure to man it seemed necessary to have the miners breathe the aluminum dust in a relatively heavy concentration which could be measured and which would be approximately the same from day to day. The best time to give the treatment was when each shift of miners came into the change room to get ready for work. The miners are enthusiastic in their approval of this method of safeguarding their health. In using aluminum dust for treatment, the patients inhale aluminum laden air through a tube. The time of treatment is gradually increased from three minutes to twelve minutes, and treatments are given three times a week for a period of twenty weeks or more. The treatment of silicosis by the inhalation of fine aluminum dust results in a decrease of cough, shortness of breath, tightness in the chest and fatigue. In a group of 104 patients who had positive x-ray evidence of silicosis but who denied any disability there were 93 who claimed to be distinctly improved after treatment. MacGregor concludes that silicosis probably can be eradicated as an occupational hazard by means of adequate dust control and the use of aluminum dust as a preventive measure.

Alloxan Diabetes.—Duffy points out that a large intravenous dose of alloxan (200 mg. per kilogram of body weight) causes rapid death in rabbits, there being a phase of hypoglycemia followed by hyperglycemia and inanition if the animal survives for several days. At postmortem the chief change is damage to the cells of the islets of Langerhans. Survival beyond this acute toxic phase may be secured by appropriate treatment with dextrose by mouth during the first forty-eight hours, followed sometimes by insulin during the first two weeks. Animals which survive the acute toxic phase develop a condition similar to human diabetes, with hyperglycemia, glycosuria, polyuria, polyphagia and cataract. There is diminished tolerance of dextrose, but tolerance is increased by administration of insulin. Ketouria, except at the early phase, is not a feature on ordinary diet but may be induced by administration of excess dextrose. In a proportion of cases spontaneous recovery occurs after several weeks or months, but animals have remained diabetic for as long as six to nine months. The only constant lesion in the diabetic rabbits is diminution in size of the pancreatic islets and reduction in number of beta cells, which also show enlargement, degranulation and sometimes vacuolation and hydropic change. The alpha cells are practically unaffected.

Asthmatic Reaction in Ovarian Teratoma.—Thomson reports the history of a woman, aged 47, who died in an attack of bronchial asthma. There were found in the teratomatous respiratory tissue of an ovarian teratoma "asthmatic" changes similar to those present in the bronchi.

Treatment of Large Cystoceles.—Patel and Dubost describe an abdominal cystohysterectomy which they performed in 7 cases. They say that this intervention represents a solution for the surgical treatment of large cystoceles. In this method the trigonal vaginal portion of the bladder is attached to the anterior surface of the uterus, and then the uterus is attached to the abdominal wall; thus uterus and bladder are raised at the same time. In 4 of the cases the uterine fixation was made according to the method of Doléris. In the other cases, which concerned women of advanced age, direct fixation of the uterine fundus was done. Posterior colpoperineorrhaphy was done in only 3 cases, but the authors think that it should always be performed. As regards danger to the ureter, it is easily avoided by either inserting ureteral catheters or by taking care that the inferior point of vesicouterine attachment does not take the whole width of the bladder.

Hematologic and Clinical Considerations on the "Erythroblastic Disease in Adults." R. Crosnier and F. Morel.—p. 285.

Acute Eosinophilic Leukemia.—Ravault and his associates present a brief summary of 8 previously recorded cases of acute eosinophilic leukemia, adding the report of an additional case of a man aged 60. Acute eosinophilic leukemia is a rare disease occurring more frequently in men than in women. The clinical picture appears to be that of acute leukosis rather than of chronic leukemia. There may be rise of temperature, buccopharyngeal phenomena, osteoarticular pains, hemorrhages, and definite but moderate hypertrophy of the hemopoietic organs. Death may occur within several weeks or months. Examination of the blood may reveal a more or less considerable leukocytosis in which the eosinophils are the predominant cells; many of the cells may be immature.

Friedreich's Disease in Four Brothers: Etiology, Symptomatology, Prognosis and Therapy. A. Garaiso and B. Vijnorsky.—p. 363.

Antituberculosis Vaccination.—Chattas and Degoy report the results of BCG vaccination given intradermally to 250 infants during the first week of life. The dose of the vaccine was 0.15 mg. for 115 infants and 0.30 mg. for 102 infants. BCG was given by mouth to 68 nonallergic infants and children between the ages of 5 months and 14 years. The infants and children in this group gave negative results to the tuberculin tests with 0.10 mg. of tuberculin. The substance was given in a dose of 0.20 Gm. in 10 cc. of the vehicle. The authors found (1) that BCG is harmless in the doses given, (2) that allergy appears sooner in infants and children who receive large doses of BCG than in those who are given the classic doses of the substance and (3) the percentage of infants and children who become allergic is higher for the former and lower for the latter.

- *Spontaneous Cutaneous Emphysema in Course of Attacks of Asthma. E. G. Fongi and P. C. Rospide.—p. 46.

Spontaneous Subcutaneous Emphysema.—According to Fongi and Rospide, spontaneous subcutaneous emphysema in the course of attacks of asthma is rare. The authors report 2 cases at 22 and 26 years of age, respectively. Nausea, pain on deglutition, moderate cyanosis and subcutaneous emphysema of the supraclavicular zones and the neck appeared in the course of an attack. Crepitation was heard on auscultation of the precordial region. Roentgenograms of the chest and of the neck in 1 case showed air in the form of a clear band about the left ventricle and in the form of two bands on both sides of the trachea. On the basis of the reports in the literature and of their x-ray findings, the authors believe that spontaneous subcutaneous emphysema in the course of an asthmatic attack is due to rupture of pulmonary vesicles in the pulmonary interstitial tissue, with consequent increased pressure and escape of the air into the mediastinum and the cellular subcutaneous tissues of the neck. The prognosis is favorable. The therapy consists of analeptics, oxygen inhalation or subcutaneous continuous injection of oxygen. Incision of the emphysematous blebs is only rarely necessary.

Book Notices

Alcohol, Science and Society: Twenty-Nine Lectures with Discussions as Given at the Yale Summer School of Alcohol Studies. Cloth. Price, \$5. Pp. 473. New Haven, Conn.: Quarterly Journal of Studies on Alcohol, 1945.

Here are included twenty-nine lectures with the discussion given at the Yale Summer School of Alcohol Studies during 1944. The subjects include considerations of metabolism and physiology of alcohol, the relation of alcohol to nutrition, the psychologic and psychiatric aspects of excessive drinking and inebriety, the relation of alcohol to pauperism and traffic, the medical treatment of the inebriate and similar topics. Altogether, the book provides about as complete a consideration of the subject as is anywhere available. The concluding chapter is a consideration of Alcoholics Anonymous, the most recent group movement for self control by inebriates.

Bone-Grafting in the Treatment of Fractures. By J. R. Armstrong, M.D., M.Ch., F.R.C.S., A/W/Comm. R. A. F. M. S. and Surgeon-in-Charge of an R. A. F. Orthopaedic and Fracture Centre. Foreword by R. Watson-Jones, B.Sc., M.Ch.Orth., F.R.C.S. Fabrikoid. Price, \$7. Pp. 175, with 204 illustrations. Baltimore: William Wood & Company, 1945.

This is a carefully prepared report on the experiences of the author in the management of 76 cases of bone grafting in the treatment of fractures. The general principles relating to the use of bone grafts are excellently set forth but there is perhaps too great an elaboration of operative details. More emphasis might have been given to a statistical analysis of the results in support of the author's conclusions. Fractures of the carpal navicular bone are particularly well dealt with, and the technic of closed pegging for graft fixation in case of delayed or nonunion is an ingenious procedure. Technical points that are open to argument are the necessity for both nail and intramedullary graft fixation for ununited fractures of the neck of the femur with survival of the head, extensive periosteal stripping for complete freshening up of the ends of an ununited fracture, the necessity for always fixing bone grafts with screws, and the author's tolerance for boiled grafts. The sections on preoperative and postoperative care are based on sound clinical thinking that characterizes the general sections. Emphasis on protection of the graft site, promotion of active rather than passive exercise and the avoidance of manipulation are welcome.

Common Ailments of Man. Edited by Morris Fishbein, M.D., Editor, *Hygeia*, the Health Magazine. Cloth. Price, \$1. Pp. 177, with 6 illustrations. Garden City, N. Y. Garden City Publishing Co., Inc., 1945.

The education of the public in health matters has one primary motivation—the need for preventing self medication and the substitution therefor of accurate diagnosis and scientific therapy. There are, however, certain facts about diseases of which all persons should be aware to enable them to seek the proper medical care at the right time. People are too prone to ignore everyday afflictions—common ailments such as colds, headache and backache. Yet all of these conditions may be warnings of impending danger, of the presence of some serious disorder which, when diagnosed early, is amenable to treatment. In this book a number of these common disorders are discussed in a clear, simple and scientific manner. Each ailment is considered by a recognized specialist in his field; hence the information is authentic. The physician can recommend this book to his patients without hesitation as a source of the type of information on disease with which the public should be acquainted.

Forget Your Age! By Peter J. Steincrohn, M.D. Cloth. Price, \$2.50. Pp. 238. Garden City: Doubleday, Doran and Company, Inc., 1945.

The advances made by modern medicine have lengthened life and diminished illness. Dr. Steincrohn has written previously essays and books enlightening the public on the progress of medicine, including "You Don't Have to Exercise," "Heart Disease Is Curable" and "More Years for the Asking." The present book is inspirational and should do much good in overcoming hypochondriasis in men and women who despair because the years creep upon them.

Men Under Stress. By Roy R. Grinker, Lt. Col., M. C., and John P. Spiegel, Major, M. C., Army Air Forces, United States. Cloth. Price, \$3. Pp. 483. Philadelphia: Blakiston Company, 1945.

In 1943 the authors gave a report on the treatment of combat induced illnesses in the North African campaign. The work had been carried out at a hospital behind the lines on patients from ground and air forces and from British and American fighting units. The present book is based on studies of American Air Force patients at a unique hospital for their treatment in St. Petersburg, Fla. In essential conclusions there are no important differences between the two studies.

In several ways this book is an important contribution to the literature of the war. To flight surgeons and to psychiatrists of the Air Forces it will be an emotional stimulus, an intellectual guide and in some degree a handbook. To those who are responsible for military organization it is a challenge because its pages carry implications for every aspect of military psychiatry and military organization: e. g. for the processes of selection and classification, the correlation of psychology and psychiatry and the conservation of military manpower by reducing the incidence of emotional breakdowns both in training camp and in combat. In this connection light is shed on the problem of group loyalty as a source of strength and on how it can increase vulnerability. There are indications of the methods by which men can be motivated for combat. And finally there are important implications concerning the role which psychiatry must play in relation to command in determining personnel policies in future military organizations.

None of these implications are developed in detail and the reader is usually left to draw his own conclusions on these broad aspects of military policy. Because the authors were still in military service while the book was being written, no other procedure was possible for them. It is to be hoped, however, that now that they are civilians they will feel free to develop unsparingly and in detail every criticism of traditional military caste, organization and procedure which is implicit in their work. Such lessons must be drawn now; otherwise as war recedes into the past we shall forget these problems, and army organization will lapse into its traditional errors.

Yet the main focus of the book is not on such organizational problems as these but rather on the technics of therapy and on a theoretical formulation of vulnerability, of the process of falling ill and of the process of recovery. The material of the book is divided into five major sections: (1) the kind of men who go into military aviation, (2) psychologic stresses of combat, (3) the reactions to combat, (4) the delayed reactions after combat and (5) civilian applications of military psychiatry.

The reviewer finds himself always interested and challenged but not always convinced. The grounds of disagreement are technical, however, and need not be elaborated here, because they in no way impair the general usefulness of the book to the audience for which it was written. One would only warn the young flight surgeon or psychiatrist not to be too concerned if certain basic concepts are unclear and are sometimes used in contradictory senses. One suspects that the authors themselves are never quite satisfied with their own formulations because they make many attempts to restate in varying ways their theory of the dynamics of illness and cure. In view of the complexity of the theoretical aspects of the problem, one should feel only respect for this perplexity.

The procedure of narcosynthesis under pentothal is clearly described, but the theoretical rationale of the technic is not free from the confusions and contradictions mentioned. Nor can the reviewer agree with the authors that narcosynthesis differs fundamentally from the technics of "narcoanalysis" and "hypnoanalysis" as these were practiced by certain earlier investigators. There are important differences in emphasis but there are also many important similarities. Narcosynthesis is rather a more nearly mature evolution out of these earlier and sometimes naive beginnings. Although it is still in the experimental stage itself, one may safely predict that narcosynthesis will exercise a profound influence on the evolution of psychotherapeutic technics in the coming decade and that the work of these authors will always stand as a milestone in the evolution both of military psychiatry and of psychotherapy in general.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

VITAMINS AND NEOSTIGMINE FOR DEAFNESS

To the Editor:—Are any particular vitamins or combinations of vitamins recommended in the treatment of chronic catarrhal otitis media with deafness? Has neostigmine methylsulfate been proved of any value?

William P. Borran, M.D., New York.

ANSWER.—The query cannot be answered without a definite understanding as to what is meant by the phrase catarrhal otitis media with deafness. There are many able clinicians who are not inclined to make this diagnosis often, for in their experience the more severe types of chronic deafness turn out to be lesions of the inner ear or otosclerosis. Certainly no diagnosis of the nature of hearing loss should be made without one or more careful tests of hearing capacity. The diagnosis of chronic catarrhal otitis media should not be made in the presence of a normal or nearly normal membrana tympani; nor should, if this condition is diagnosed, a pronounced loss in the higher tone range be assigned to pathologic changes in the middle ear. There are many cases of "played out" middle ear disease of childhood with changes in the membrana tympani in which later deafness of the inner ear type develops. Lastly there is reason to believe that for a short time, at least following inflation of the middle ear, there should be some demonstrable hearing improvement in instances of true chronic otitis media of catarrhal nature. This could not be true in otosclerosis, and it is this condition which would offer a great deal of difficulty in a differential diagnosis. A diagnosis once assured, however, there is still a good deal of difference of opinion as to the value of either vitamins or neostigmine methylsulfate in the treatment of deafness due to catarrhal states.

There has been no particular evidence that the mild avitaminosis so widely postulated nowadays is the cause of severe ear difficulties, nor should the observations in human beings be equated with the results seen in animal experimentation, in which the avitaminosis produced is severe. It is nevertheless not wrong to prescribe vitamins in the treatment of a patient with chronic catarrhal otitis media associated with difficulty in hearing, if the physician has an open mind, makes no excessive promises and most of all is exceedingly precise in his examination of the middle ear and in testing and retesting the hearing. His diagnosis with regard to the location of the seat of the pathologic condition in the hearing apparatus will be accurate and he will in addition rule out causes in the middle ear for deafness which are at least partially self curative (i. e. secretory catarrhal states).

There is less to be said in favor of neostigmine methylsulfate as a therapeutic aid in deafness than there is for the vitamins. Its use is highly empirical and should be viewed with skepticism.

HEMORRHAGIC PURPURA

To the Editor:—Would you please inform me whether there is any recent advancement in the treatment of purpura hemorrhagica in children?

V. W. Pryor, M.D., Holdenville, Okla.

ANSWER.—There is no recent advance in the general treatment of purpura hemorrhagica (primary thrombopenic purpura) that has given uniformly good results. For the control of local bleeding externally, thromboplastic substances have proved quite effective. As spontaneous recovery frequently occurs in children with hemorrhagic purpura, splenectomy should be reserved for chronic cases of over six to twelve months' duration.

EFFECTIVENESS OF PENICILLIN OF DIFFERENT MANUFACTURE

To the Editor:—A current comment in *The Journal*, July 7, 1945, states that the activity of penicillin varies with the method of manufacture. Could it be that the F substance is more active against hemolytic staphylococci? In March 1944, under the direction of the National Research Council, it was my privilege to treat a case of subacute bacterial endocarditis from which hemolytic staphylococci had been cultured. The treatment seems to have been a success. Just a year later I used about the same dosage of penicillin in a pelvic infection which produced abscesses despite the penicillin treatment; from these only hemolytic staphylococci could be cultured. Despite penicillin, suitable drainages, transfusions and so forth this patient finally died. The first patient was treated with penicillin from Commercial Solvents Corporation supplied through the National Research Council. The second patient was treated with various brands, mainly Upjohn's. Is there a difference?

L. A. Wheelwright, M.D., Grangeville, Ida.

ANSWER.—There is no evidence that the clinical results obtained from the use of penicillin vary with the method of its manufacture. The results and outcome of infection following penicillin treatment vary more often with the site of the infection, the sensitivity of the infecting strain of organism, the stage of the disease at which treatment is started and many other factors which are difficult to define. It is known that some strains of staphylococci have been encountered in which 20 to 25 units of penicillin per cubic centimeter has had no effect on their growth. These cases have frequently been fatal.

The chances are that the preparations used both in March 1944 and in March 1945 contained mostly penicillin G, and that neither preparation contained very much penicillin F. This is so because both manufacturers mentioned produce penicillin by the submerged culture method, which yields mostly penicillin G or penicillin II.

RECTAL TUBERCULOSIS

To the Editor:—A patient with rectal tuberculosis secondary to a healed pulmonary tuberculosis has been treated by surgery two or three times, but occasional abscess formation occurs. Ulceration is chronically present and cotton must be worn for a seropurulent discharge and occasional uncontrolled defecation. Pain is quite frequent. Is quartz light therapy by means of a local quartz electrode of any value? Is penicillin by any method of administration of value? What treatment apart from local treatment by a competent proctologist is advised? Could a general treatment as to prognosis be given?

M.D., New York.

ANSWER.—The questions cannot be answered satisfactorily without more information regarding the character of the condition. For example, if the involvement is hyperplastic and limited to the rectum, if the lumen is reduced to such a degree that it cannot be enlarged and if the pulmonary condition will permit, it might be advisable to resect the rectum and establish a permanent colostomy. If ulcerative disease is predominant and there is no great thickening of the bowel wall or stricture formation, local therapy should be employed. Abscesses should be drained and sinuses should be uncovered. Hot irrigations of plain water or salt solution (110 F.) several times daily are helpful, especially for the relief of pain. Quartz light has no specific value but probably should be given a sufficient trial in conjunction with other therapeutic measures in case it may help in the particular case. Penicillin should be tried for the same purpose. The prognosis as to relief of the condition of the rectum and restoration of anything resembling normal function is not good. A continuance of some local disability is to be expected. The prognosis as to life depends chiefly on the pulmonary condition.

REMOVAL OF MOLES

To the Editor:—I have been told that magnesium carbonate will cause moles to drop off. Is this drug not effective please give me the name of any other drug used systemically to cause small moles around the neck to drop off.

M.D., South Carolina.

ANSWER.—Information is not available concerning any drug which, taken internally, will destroy ordinary cutaneous nevi which, taken internally, will destroy ordinary cutaneous nevi. All effective methods are applied locally; these include surgery, physical agents such as the cautery, electrocoagulation, electrolysis, solidified carbon dioxide, x-rays and radium, and chemical agents, as trichloroacetic acid. The common nevi about the neck that occur so often in middle aged women, known commonly as tags, are most easily removed with the cautery or by electrocoagulation. A few nevi may be stirred to malignant activity by tampering with them. If one chooses to remove them, it must be done in a careful, thorough manner. If there is any doubt about the safety with which any particular nevus can be destroyed, it should be seen by an expert or left alone.

WHAT IS ADEQUATE MEDICAL CARE?

PRESIDENT'S ADDRESS

ROGER I. LEE, M.D.
BOSTON

Somewhat over ten years ago, in 1933, Lewis Webster Jones, now president of Bennington College, and I, with the help of Barbara Jones, made an attempt to define adequate medical care in the United States for the Committee on the Costs of Medical Care. This was a pioneering effort. It was done because it seemed to us that a beginning had to be made, and it was our pious hope that from this feeble attempt might come improved and more helpful studies on adequate medical care. To our disappointment, our work has mostly accumulated dust on bookshelves.

However, there have been many clarion shouts that medical care in the United States is inadequate, here, there and elsewhere, in this disease or that condition, but as far as I know no one has attempted to redefine adequate medical care or has suggested another yardstick to measure medical care. To be sure, in very limited fields a medical writer claims occasionally that this or that procedure, usually highly technical and often surgical, is inadequate, while his own is adequate. However, in the main, when reference is made to medical care in a broad sense statements usually run as follows: "Such and such a community has inadequate medical care because there is less than 1 doctor per 1,500 inhabitants." Again in 1936 untrained investigators asked people in a house to house survey if they had medical care. If the people said "No," they were recorded as not having adequate medical care. Or if they didn't like their medical care or they thought it was inadequate, then they too were recorded as having inadequate medical care. The resulting records were broadcast all over the land and were described as indicative of a melancholy and parlous state of inadequacy of medical care and of callous neglect by the medical profession.

STATISTICS FROM THE DRAFT

More recently there have been some highly colored statements regarding the large percentage of rejections for physical defects in connection with the operation of the Selective Service act. The figures are sobering and call for careful examination and considered action. But many of these defects have no relation to medical care, adequate or inadequate. Nature does not uniformly produce perfect fruit, be it babies, puppies, calves or apples. If children are very nearsighted or astigmatic, adequate medical care demands glasses for

the correction; but the Army or the Navy decides whether or not it wants such an individual. And little can be done about color blindness.

Some of these defects have a larger personal factor in their evaluation, both on the side of the examining doctor and on the side of the examined youth. If a lad is determined enough a little allergy or a little eye abnormality is often surmounted, as many fathers know.

The statistics from the draft in regard to mental and nervous conditions is of course disturbing. That is an unexplored area which is not really relevant to the discussion of adequate medical care. But I shall have something more to say on this vast and perplexing problem later on in the discussion. Certainly illiteracy is outrageous, but it is certainly not related to the problem of medical care.

SHIFTING CONCEPTS OF ADEQUATE CARE

Having participated in writing a book on adequate medical care, I am not oblivious to the difficulties involved, which include the extraordinary and continuing advances in medical science. When the book was written, serum therapy for pneumonia was the best we could offer. It was good; but it is always complicated to give intravenous therapy, except perhaps in a hospital. It is much simpler to give tablets of the sulfonamides and it is more effective. Then there was a tendency to change from sulfonamide tablets to intramuscular penicillin and now we have oral penicillin. And after penicillin what? In any event the general use of serum therapy seems almost ghostlike today. Likewise the present day treatment of venereal diseases is a changing No Man's Land.

Obstetric care has probably changed more than any other standard procedure. This progress in obstetrics has got the medical profession into a lot of trouble. The necessary anesthesia, the prompt surgical repairs, the nursing are most conveniently done in a hospital. Thus modern obstetrics ranks (roughly speaking) with catastrophic illness or operations as a major inroad on the family budget. In a generation obstetrics has entirely changed its status not merely as a medical procedure and problem but as an economic problem. Personally I happen to think that the concomitants of modern obstetrics are a part of adequate medical care. The definition changes.

Personally, again, I believe in the doctrine of the self limitation of certain diseases, including the common cold. But there are those who believe in the energetic local treatment of a cold. The difference in medical visits and dollars between the two schools of thought is very great.

Of course, we all know that luxury medicine is a factor and curiously enough is a factor when the fee-for-visit system does not prevail. It was particularly

President's address before the House of Delegates of the American Medical Association, Chicago, December 3, 1945

interesting in the days of acute doctor shortage, nurse shortage, laboratory shortage and hospital bed shortage what deletions could be made in a program of adequate medical care without real hardship. Doubtless some of our great hospitals and great medical schools have been grievous offenders in carrying out unnecessary procedures, thus encouraging the graduates in bad habits and offering a bad example to patients by furnishing superfluous medical attention. Probably the substantial majority of patients like more attention than is adequate, like to be fussed over and, surprisingly enough, are often willing to pay for it. Hence the charlatan, the quack and the cultist. Hence self medication, food fads and did I say vitamins or didn't I? Sometimes when I am feeling courageous I'm going to take a sleeping car poll. How many of the passengers do you think take a little something to help them sleep? It isn't liquid or alcoholic as in the old days, but one of the barbiturates.

No, I don't think it is luxury medicine, if the former prime minister of Great Britain is accompanied by his personal physician on his travels. I think what most of us have in mind is best illustrated by the extraordinary medical care furnished our fighting men in the battle areas in the war. The organization of that medical service was at the same time one of the wonders of the modern world and a comfort to all who had sons, husbands, brothers in this dreadful conflict. Warfare furnishes special conditions and demands special technics that are not readily transferred to the conditions of peace.

And yet already steps have been taken to make available some of these wartime technics to civil life. The returning medical officer of the Army and the Navy will think in different terms than he did as a civilian doctor. He will be used to having blood plasma always and often whole blood as therapeutic agents. Plans are already under way so that the Red Cross, which has supplied so remarkably blood plasma and whole blood to the armed forces, will continue under necessarily changed conditions, now that the war is over, to assist in furnishing blood and blood products for civilian needs.

An incident that happened during the Allied push across the Rhine is worthy of record. It was a busy day at a given blood center. Donors were lined up waiting their turn to give their blood. A man and his wife entered the scene in great distress and perplexity. Their child was sick at a nearby hospital and needed immediately several transfusions, but the hospital had no blood. Here in the blood donor center was blood, plenty of it, and their child needed the blood even as a wounded soldier needed it. Even though the blood from the donor center had to go to the armed forces, nevertheless the situation, which had arisen before, was met satisfactorily. That situation will arise many times in the future and we trust that an adequate organization will not necessitate the repetition of this drama.

I have dwelt on this particular feature because I believe that it is illustrative of trends that will alter our appraisal of adequate medical care. Plasma and whole blood not so long ago were generally given only in well equipped hospitals. Yesterday they were given on the battlefield, on the beaches, in the jungles by Hospital Corpsmen. Obviously if the materials are available, as we firmly believe they will be, they will be administered by the general practitioners at home or at the site of the accident as well as in the hospitals large and small.

DRIFT BETWEEN SPECIALISTS AND GENERAL PRACTITIONERS

In the discussion of adequate medical care, the problem of specialist service both in therapeutics and in diagnosis is always large and important. And herein are also trends and changes. It seems likely that the venereal diseases will be largely returned to the general practitioner. Certainly he is competent to treat gonorrhea with the sulfonamides. Certainly he is entirely competent to arrange for the administration of penicillin, and especially if the oral administration of penicillin materializes as a satisfactory procedure, as we now believe. Of course the last word has not been said and changes are occurring every moment, but I think that the general practitioner was a little overwhelmed and dizzy when it came to the treatment of syphilis by intravenous administration of the arsenicals. That day belongs to the past.

I have already alluded to the change in the treatment of pneumonia. The typing of the sputum, the administration of the appropriate serum intravenously generally seemed very complex to the general practitioner. A recent personal experience seems to me to be illustrative! A practitioner telephoned that he was sending a patient to the local hospital and could I see him. I asked if the patient didn't have pneumonia. No, the practitioner didn't think so but he would have an x-ray of his chest as he went by the x-ray room to his hospital room. After a while he telephoned "Well, you won't have to come out, he only has pneumonia and a leukocytosis and everything is fine." Only pneumonia; what a change!

I can remember the time when the diagnosis of pulmonary tuberculosis was both a science and an art. We practiced percussion and auscultation just as our surgical colleagues practiced tying knots. I still think there is something in it. But we all nowadays, including the patient and the family, insist on an x-ray. And your general practitioner can allay apprehensions about a continual cough by simply arranging for an x-ray of the chest. However, if the patient does happen to have tuberculosis I'll admit that the general practitioner is out of his depth. The modern treatment of tuberculosis no longer consists in rest; fresh air, milk; eggs and a desire to live but often demands one and perhaps several highly specialized forms of surgical technic. But on the other hand pulmonary tuberculosis is steadily and substantially decreasing in frequency.

Time was when the general practitioner awaited jaundice before he made the diagnosis of gallstones, and obvious bleeding before he diagnosed peptic ulcer. But nowadays the radiologist seems usually to make these diagnoses. Furthermore, by some route or other many cases of ulcer arrive in the offices of those who specialize in digestive disorders. While psychosomatic medicine bluntly states that most digestive disturbances are due to causes above the neck, nevertheless the trek goes on. The apostles of psychosomatic medicine find here the classic illustration of their philosophy.

In the cardiovascular field your general practitioner has not found the comfort from the electrocardiograph that he hoped. The interpretations of the electrocardiograms are not always simple and lucid, and subsequent therapy is not always obvious. Angina is often indefinite. Hypertension is often relative. Arrhythmias may be complicated. On the whole, whether he admits it or not or likes it or not, the general practitioner has to

depend on the specialty of cardiologists more than seems perhaps necessary.

I have given this rapid survey of certain fields in medicine with the purpose of indicating that medicine is ever changing and that the relations between the general practitioner and the specialist are always in a state of flux. The drift is not always away from the general practitioner but sometimes definitely at any given moment in his direction. These are the factors that must be evaluated in determining what is adequate medical care.

It will be noted that even if and when the general practitioner is furnished with proper and adequate x-ray equipment and interpretation, which means specialists' services, that is in some fields not sufficient. The supplementary use of certain technics or gadgets, as the electrocardiograph, in a goodly number of instances at this time does not seem to be always satisfactory.

I have not touched on the surgical specialists at all. This is largely because it seems to me at this moment that surgery is becoming a profession in itself and indeed has its own specialists. I have mentioned lung surgery, which actually is not within the province of a general surgeon. The neurologic surgeon is another example of a limited specialist within the profession of surgery.

I have deliberately omitted the relationship of psychiatry to the general practitioner and to adequate medical care. Obviously the custodial care of the manifestly insane is a problem for specialists. As the general practitioner meets this part of the problem, it is often the question of having the insane person committed to an institution.

But there are implications and imponderables far beyond the scope of this paper and indeed my ability to discuss them. The war has focused attention, too long postponed, on what is known as psychoneurosis. That problem is far too large for the number of physicians who may be regarded as having special training or interest in the field. The whole situation is rather chaotic. We have rather taken much of it for granted, as we once did the poor. And, like the weather, everybody talks about it but does nothing about it. Somehow or other in this vast field the general practitioner must play an important role. He obviously has certain advantages of familiarity with human behavior under usual family conditions and of individual relationships and actions.

DIAGNOSTIC SURVEYS IN DIAGNOSTIC CENTERS

It will be observed that I have not spoken particularly of hospitals, diagnostic centers, laboratories or clinics. Obviously major surgery will be done in a hospital. Specialized surgery, like chest surgery and neurologic surgery, will not be done in every small hospital. Adequate medical care demands not just the case and a hospital. It may demand a special hospital and a specialist within the profession of surgery. Furthermore, the x-ray equipment also obviously necessary in a hospital may be in a clinic or a diagnostic center. I have pointed out frequently that most patients who visit the Mayo Clinic never get to the hospital. In other places well known clinics are quite separate entities. In the clinic most of the diagnostic work is carried out and, if necessary, hospitalization is arranged. It is argued by some of the clinic advocates that such an arrangement is tremendously money saving. Hospital residence is apt to be expensive and, if utilized for a diagnostic survey which may be time consuming, ties up hospital space designed

for quite another purpose. Perhaps hospital trustees will devise some new types of buildings within the hospital areas so that diagnostic surveys can be carried out economically for the patient and conveniently for the diagnostician.

I have not in these remarks attempted to reevaluate adequate medical care. It has been my purpose rather to make random comments on the problem and once more to express the hope that other hands will develop something far better and far more comprehensive than the pioneer effort of over ten years ago.

NEED FOR CONTINUOUS REEVALUATIONS

I appreciate the changing conditions as medical science advances with its seven league boots. I appreciate too that our social standards change. But these considerations to my mind only make such studies more imperative. There should be constant and continuing evaluations of the changing conditions. We must know what place the general practitioner and the specialist has in adequate medical care. At the moment there are trends toward specialism within specialties, particularly in surgery. Yet insulin, liver therapy, the sulfonamides and penicillin tend to return many patients to the general practitioner. Likewise there are trends in the utilization of hospitals which must be considered in evaluating medical care. Social conditions both in the home and in industry create changes to which adequate medical care is always a goal, but as we move forward we push the goal ahead.

PHILADELPHIA

It has recently become increasingly well recognized that parenteral administration of whole blood or blood products to susceptible individuals may be followed by the occurrence of a disease which is clinically indistinguishable from common acute infectious hepatitis.¹ During the latter part of 1944 a large and increasing number of cases of acute hepatitis were seen at a large army general hospital within the continental limits of the United States which serves primarily as a center

for amputation and neurosurgical cases. During the six month period from Nov. 1, 1944 to April 30, 1945 a series of 108 cases of acute hepatitis came under the care of one of us (E. B. G.). Of these cases 103, or 95 per cent, occurred in men who had recently been wounded in action in either the European or the Pacific theater of operations. The fact that the high incidence of the disease in this group of patients was not merely a reflection of the selected population of this hospital is demonstrated by the data included in table 1.

The clinical history in the battle casualty group was strikingly uniform. The patient had been wounded in action from 44 to 167 days prior to the development of symptoms of hepatitis, with a median latent period of 91 days and an average of 92.6 days. In 84 per cent of the group the onset of the disease occurred between the 8th and the 17th week after injury. The large majority had received whole blood transfusion, blood plasma or both, shortly after injury. A number of the patients in whom the latent period was long (more than four months) had received multiple blood transfusions, some as long as two months after injury. Other factors, such as severity of injury, early amputation, previous administration of sulfonamide drugs or penicillin, extensive infection and general clinical condition of the patient at the time of onset of hepatitis, appeared to play no contributory role in the incidence of the disease. Common sources of infection and secondary contact cases were not recognized. The clinical course of the disease was that seen in the usual case of infectious hepatitis. The fatality rate was 2 per cent (two deaths).

The investigation here reported was undertaken with two purposes: (1) to test the validity of the hypothesis that the hepatitis-causing agent was transmitted by blood or plasma transfusion and (2) to extend the previously reported studies of one of us² on the prophylaxis of infectious (epidemic) hepatitis by injection of human immune serum globulin (gamma globulin) to this group of patients.

During the three month period from Feb. 1 to April 30, 1945 information was obtained on all battle-casualty patients admitted to this hospital. These patients were then divided into five groups: (1) those who had received neither plasma nor whole blood, (2) those who had received plasma but not whole blood, (3) those who had received whole blood but no plasma, (4) those who had received both plasma and whole blood and (5) those concerning whom adequate infor-

mation was unobtainable because clinical records were incomplete and because these patients had been rendered unconscious for variable periods following injury.

The patients in group 1 were not given immune serum globulin injections. Groups 2, 3, 4 and 5 were each again subdivided into three subgroups, designated by the subscripts a, b and x in table 2. The x series are

composed of those who had sustained their injuries more than four months prior to admission to this hospital or who presented evidence of acute hepatitis on admission and therefore were eliminated from the test and control series. Of the remaining patients, alternate men were given injections of 10 cc. of human immune

b. Alternate controls who received no globulin.

x. Patients eliminated from test and control series.

serum globulin (obtained from the U. S. Army Medical Supply Depot) on admission and again in one month. No other selection of cases for globulin injection or control series was used. It was found that selection of alternate cases resulted in random sampling of battle casualties in these two groups. Of the globulin injected group, 10.5 per cent of the patients came from the Pacific theater, 35.5 per cent had been in the Mediterranean theater and 54 per cent had been in the European theater of operation but not in the Mediterranean. For the control group the figures for the geographic distribution were 7.5 per cent from the Pacific theater, 38.5 per cent from the Mediterranean theater and 54 per cent from the European theater of operation.

Periodic icterus index determinations on blood serum and methylene blue tests of urine for bilirubin³ were done. All patients showing abnormal laboratory findings or manifesting symptoms of hepatitis were examined by one of us. No patient was considered to have hepatitis on the basis of laboratory findings alone, but the diagnosis was made only when the laboratory findings were corroborated by the clinical evidence of manifest jaundice or hepatic enlargement accompanied by the usual subjective symptoms of the disease without frank clinical jaundice. Six patients (9 per cent of the cases of hepatitis developing in this group) were diagnosed as having hepatitis without jaundice. These 6 cases were proportionately distributed among the several series that have been described.

Results of these studies are summarized in table 2. The studies are still incomplete for the reason that an appreciable proportion of the cases included in this tabulation have been under observation for an insufficient period at the time of writing.

Fillingim, K., and Menkes, K.: Quantitative Bilirubin Determination in the Urine with the Methylene Blue Method. *Wien. klin. Wochenschr.* 40: 133, 1933. Myers, C. P.: Use of Methylene Blue in Testing for Bilirubin in the Urine. *J. Indust. Hyg. & Toxicol.* 27: 52, 1945.

The data on incidence of hepatitis as related to previous blood transfusion or blood plasma administration are given in table 3. In line 1 are given the data for patients who had received no blood or plasma, in line 2 the data for patients who had been known to have received blood or plasma, and in line 3 the data for those patients to whom it is believed, but not definitely known, that blood products were given. The conclusion that the hepatitis-causing agent was blood transmitted appears inescapable.

The preliminary results of the study of prophylaxis of hepatitis by gamma globulin injection are summarized in table 4. In line 1 are given the total figures for the incidence of hepatitis to date of writing (July 25, 1945) in the a (globulin) subgroups of series 2, 3, 4 and 5 of table 2, and in line 2 the corresponding data for the b (control) subgroups. Of 384 patients who received globulin injections, 11 developed hepatitis. Two of these had clinical manifestations of the disease prior to globulin administration, and 4 developed obvious evidence of the disease 4, 5, 5 and 6 days after injection, respectively. It is possible that the immune serum globulin was administered to those patients too late in the incubation period to be of value. There was no significant clinical or laboratory evidence of attenuation of the disease in these patients. Five patients developed hepatitis more than one week after globulin injection. In all of these, although frank jaundice developed, the clinical course was very mild, suggesting that the disease may have been attenuated by globulin administration. The 44 cases (11.5 per cent) of the control series of 384 patients represents the minimum incidence of the disease in this control group. A number of these patients have been under observation for an insufficient period, and cases of hepatitis are continuing to appear in this control group.

COMMENT

The reporting of this series of cases appears important in view of the high morbidity and mortality recently experienced both in England and in the United States from hepatitis secondary to the administration of blood products in battle casualties. Also the primary reason for such a report lies in the highly significant protection against hepatitis obtained by the use of gamma globulin. Previous experience with the use of gamma globulin in three epidemics of hepatitis obtained by one of us⁴ in collaboration with Capt. John R. Neefe, Capt. Sydney S. Gellis and others had clearly indicated its

result of the gamma globulin, despite its injection at the end of an incubation period of several months. The protective effect of the gamma globulin suggests either that the agent from these blood products producing hepatitis is the same agent as that occurring in the epidemic hepatitis in which gamma globulin previously

TABLE 4.—Prevention of Hepatitis by Human Immune Serum Globulin (Gamma Globulin)

had been effective or that antibodies protective against more than one agent producing hepatitis have been concentrated in the globulin from the large pools of plasma.

Although some evidence, as yet inconclusive, suggests that more than one agent or more than one strain of the same agent may produce a type of hepatitis which possesses in general the same clinical and pathologic picture, the data here reported would neither support nor contradict such evidence. The history of a long incubation period in the casualties included in this report and in those investigated in other hospitals in the zone of interior is probably due to the fact that those having short incubation periods were hospitalized in the European and Mediterranean theaters of operation. Short incubation periods of approximately 20 to 30 days have been noted following parenteral injection of homologous blood products in the European and Mediterranean theaters of operation and in injected volunteers in the zone of interior, but such reported occurrences have been relatively few. Further studies of these phenomena in such casualties and in human volunteers will be necessary before an understanding of the problem of single or multiple etiology can be obtained.

SUMMARY

1. A series of 103 cases of post-transfusion hepatitis occurred within a period of six months at one United States Army general hospital.

2. Data indicate that the hepatitis-causing agent was transmitted to these patients through the medium of blood plasma or whole blood transfusion.

3. Evidence indicates that the early administration of human immune serum globulin was effective in this series of cases.

4. This series of cases is to be further studied and reported at a later date.

ADDENDUM

A study similar to the one reported was initiated somewhat later at another general hospital (to be reported by Col. G. G. Duncan, A. U. S., Lieut. Col. H. A. Christian, A. U. S., and Joseph Stokes Jr.). The procedure differed only to the extent that a single injection of gamma globulin was given as compared with the use of a second injection one month after the first in the present study. In this second study the use of gamma globulin appeared to have no effect on the incidence of homologous serum hepatitis in battle casualties who had received transfusions of blood or plasma. Recently an experimental study of the neutralizing effect of one preparation of gamma globulin on one causative agent of serum hepatitis has been conducted by Capt. Sydney S.

Gellis, M. C., A. U. S., Capt. John R. Neefe, M. C., A. U. S., and one of the present authors (J. S. Jr.). Under these experimental conditions (to be reported) neutralizing antibodies for this causative agent of serum hepatitis apparently were absent, the gamma globulin having no effect on the incidence of hepatitis in human volunteers injected with this agent. Thus the results of the use of gamma globulin for prevention of homologous serum hepatitis have been conflicting to date, the globulin having been very effective under the circumstances described in the present report but apparently ineffective under other conditions. Although no explanation of the conflicting results is at hand, the following factors may have been influential: (1) the possibility that immunologically different agents were concerned, (2) the possible variation in antibody content of different preparations of gamma globulin and (3) the possible beneficial effect of repeated injections of gamma globulin in view of the long incubation period of the disease (two to four months). Further studies obviously are necessary to clarify these points and to establish the place of gamma globulin in the prevention of homologous serum hepatitis.

THE RECOGNITION OF PRIMARY HYPERPARATHYROIDISM

AN ANALYSIS OF TWENTY-FOUR CASES

F. RAYMOND KEATING JR., MD

AND

EDWARD N. COOK, M.D.

ROCHESTER, MINN.

The discovery that hyperparathyroidism is the cause of generalized osteitis fibrosa cystica has led to a widespread assumption that hyperparathyroidism manifests itself only as a disease of bone.¹ Because osteitis fibrosa cystica is a great rarity, it has been assumed that hyperparathyroidism is equally rare. Both of these assumptions have been proved to be false but they have nonetheless persisted.

In 1934 Albright and his associates² at the Massachusetts General Hospital reported 17 proved cases of hyperparathyroidism, most of which they had observed during a period of two years. Analysis of these cases led them to conclude that (1) hyperparathyroidism can occur without evident disease of bone, (2) involvement of the urinary tract is a more common and more important manifestation of hyperparathyroidism than involvement of the skeleton, (3) hyperparathyroidism is relatively common and (4) it is the etiologic factor in the formation of renal calculi in an appreciable number of cases. Subsequent experience of this group of investigators has amply substantiated these conclusions.³ By 1942 Cope⁴ was able to report the remarkable total of 67 proved cases of hyperparathyroidism which had been observed at the Massachusetts General Hospital over a period of ten years. Classic osteitis fibrosa

cystica had been encountered in about a third of these and minimal or atypical osseous changes had occurred in another third, while in the remainder of the cases evidence of skeletal involvement was altogether lacking.

The experience of the investigators at the Massachusetts General Hospital has been unique with regard both to the remarkably large number of patients proved to have the disease and to the frequency with which it was encountered in the absence of skeletal involvement. By contrast, there have been few case reports from other sources describing hyperparathyroidism without classic bone disease.⁵ The great majority of published reports have continued to deal with patients having classic generalized osteitis fibrosa cystica, usually of severe degree.⁶

The first case of hyperparathyroidism to be observed at the Mayo Clinic was reported by Wilder⁷ in 1929. For many years the diagnosis was made infrequently.⁸ Alexander, Pemberton, Kepler and Broders⁹ were able to collect data on only 14 cases of proved hyperparathyroidism which had been observed at the clinic between 1929 and September 1942. Considering the much greater incidence which had been encountered by Albright and his colleagues, it appeared reasonable that here as well as elsewhere the diagnosis was being overlooked. Accordingly, early in 1943 a deliberate attempt was made to improve diagnostic accuracy. To this end the collaboration of internists, urologists and surgeons was solicited.

In approximately two and a half years (Sept. 30, 1942 to Jan. 30, 1945) in 24 additional cases hyperparathyroidism has been proved at operation at the Mayo Clinic, in contrast to 14 cases observed during the preceding fourteen years. Our experience with these patients confirms fully the observations made much earlier by the Boston workers. It is our purpose in this report to analyze the diagnostic features presented by this group of cases and to emphasize again the frequency and importance of this disease.

The increase in the frequency with which hyperparathyroidism was recognized was due in part to deliberate search, particularly among patients having renal calculi and in part to careful adherence to the diagnostic

criteria outlined by Albright and his associates.³ The disease was first suspected because of symptoms referable to the skeleton in 6 of the 24 cases and because of symptoms referable to renal calculi in 18 cases.

CLASSIFICATION

The patients may be divided into three groups, depending on the extent of skeletal involvement as indicated by roentgenographic examination. Group 1 includes 7 cases (29 per cent) presenting the classic picture of osteitis fibrosa cystica generalisata. Three of these patients had renal calculi, and 2 of the remainder had military calcification of the renal parenchyma. Group 2 includes 9 cases (38 per cent) which showed minimal or atypical demineralization of the skeleton. All of these patients had, or had had, renal calculi. Group 3 includes 8 cases (33 per cent) in which there were renal calculi but no evidence whatever of skeletal involvement. Thus disease of bone was more or less evident in some degree in 67 per cent of the cases, whereas renal calculi or calcification of the kidneys occurred in 92 per cent. We have not observed any example of a fourth group represented in Albright's series by 1 case; that is, minimal demineralization of the skeleton without renal calculi.

The average age of the patients at the time of operation was 44½ years. The youngest patient was a man of 25 and the oldest a woman of 68. There were 14 men and 10 women in the series. In the literature at large and in other series which have been reported, women have generally outnumbered men in a ratio of 3 or 4 to 1.¹⁰ The unusual sex distribution in our series may be in part a reflection of the preponderance of renal cases in our material. Group 1 (classic bone disease) comprised 4 women and 3 men, whereas group 3 (no apparent bone disease) comprised 6 men and 2 women. One may therefore wonder whether classic bone disease is more likely to occur in women and renal stones more frequently in men.

Figure 1 shows the duration of symptoms in the three groups of cases, using the medical history as a basis for dating the earliest symptom. The average duration of symptoms in group 1 (classic bone disease) was six and a half years, in patients having minimal bone disease (group 2) thirteen years and in patients without bone disease (group 3) 6.8 years. Some implications of these data will be mentioned later. Two patients had definite histories of renal stones of twenty-six and twenty-seven years' duration, respectively; yet both these patients showed minimal demineralization of the skull as the sole evidence of skeletal involvement. By contrast, another patient had no symptom prior to a single renal colic twelve days before examination. Since this patient also was found to have multiple renal calculi and visible demineralization of the skull, it is evident in this instance that the disease must have been present considerably longer than the history would suggest.

SYMPTOMATOLOGY

The variable manifestations of hyperparathyroidism have been repeatedly emphasized.¹¹ The essential character of the disease was early described by Hannon, Shorr, McClellan and Du Bois,¹² by Bauer, Albright

and Aub¹³ and by Barr and others¹⁴ in reports dealing with the first instances of hyperparathyroidism recognized in this country. The symptoms presented by patients having hyperparathyroidism may be divided into three groups:¹⁵ (1) symptoms resulting from the chemical changes in the blood and urine, (2) symptoms resulting from secondary involvement of the urinary tract and (3) symptoms resulting from involvement of the skeleton.

Symptoms Associated with the Chemical Changes in the Blood.—Hyperparathyroidism is characterized by an increase of calcium and a reduction of inorganic phosphorus in serum. As one would expect, symptoms occur which represent the antithesis of parathyroid tetany. Pronounced muscular atony is found and, with it, weakness, fatigue and constipation. Anorexia, loss of weight, nausea and vomiting also are encountered. In many of the cases of advanced hyperparathyroidism with skeletal involvement reported in the literature, such general symptoms have been very severe. In the present series, however, such symptoms were not prominent.

Fig 1—The duration of symptoms in the three groups of cases, using the medical history as a basis for dating the earliest symptom. The average duration of symptoms in group 1 (classic bone disease) was six and a half years, in patients having minimal bone disease (group 2) thirteen years and in patients without bone disease (group 3) 6.8 years. Some implications of these data will be mentioned later. Two patients had definite histories of renal stones of twenty-six and twenty-seven years' duration, respectively; yet both these patients showed minimal demineralization of the skull as the sole evidence of skeletal involvement. By contrast, another patient had no symptom prior to a single renal colic twelve days before examination. Since this patient also was found to have multiple renal calculi and visible demineralization of the skull, it is evident in this instance that the disease must have been present considerably longer than the history would suggest.

In the patients having classic bone disease, general symptoms were severe in 3 cases and moderate or inconspicuous in the others. Conspicuous weakness, fatigue, nausea and vomiting occurred in 2 cases with minimal bone disease (group 2); in 4 other cases of this group these symptoms were minimal and in 3 cases entirely absent. Mild symptoms occurred in half of the patients without evident bone disease (group 3). The foregoing symptoms could be correlated roughly with the degree of hypercalcemia.

Except when they were conspicuous, the general symptoms related to hypercalcemia offered little clue to the diagnosis, largely because such symptoms are not distinctive and are frequently encountered in other conditions, particularly functional states.

Polyuria.—The excessive excretion of calcium and phosphorus in the urine which is characteristic of hyperparathyroidism may be accompanied at times by severe polyuria and polydipsia. At times these symptoms have been conspicuous enough to lead to an erroneous diagnosis of diabetes insipidus¹⁵ (case 3, reported by Allan,¹⁶ and case 17).¹⁷ Conspicuous polyuria and polydipsia occurred in 11 (46 per cent) of the cases, distributed evenly among the three groups. In 16 cases (67 per cent) there was persistently dilute urine, with a specific gravity which never exceeded 1.015. This may be regarded either as the result of hypercalciuria or perhaps as evidence of impaired renal function.

Fig. 2.—The levels of calcium, inorganic phosphorus and alkaline phosphatase in serum of patients with hyperparathyroidism. The cases in each group are arranged in the order of average calcium values. Each vertical column represents determinations in an individual case, black dots representing individual determinations and circles the average level.

Symptoms Referable to the Urinary Tract.—The excessive excretion of calcium and phosphorus in the urine as a result of hyperparathyroidism provides conditions which favor the formation of renal calculi in the renal pelvis or even deposition of calcium in the renal

tubules. Albright and his associates¹⁸ have shown the latter to be the probable explanation for nephrocalcinosis, or diffuse calcification of the renal parenchyma, which occurs in some instances of hyperparathyroidism. Thus urinary symptoms may be produced in hyperparathyroidism (1) by urinary calculi per se, (2) by infection of the urinary tract and pyelonephritis resulting from renal calculi or (3) by impaired urinary function resulting from nephrocalcinosis.

Symptoms attributable directly or indirectly to renal calculi occurred in 18 of the 24 cases. Such symptoms did not differ in any discernible respect from those resulting from renal calculi from other causes. At first hyperparathyroidism was sought particularly in patients with a long history of renal calculi or in those found on examination to have multiple or bilateral calculi. It soon became apparent, however, that, as Albright had stated, hyperparathyroidism must be suspected in any patient having renal calculi containing calcium.

Bilateral multiple calculi occurred in 7 of the 24 cases in our series, multiple calculi limited to one kidney in 7 cases and a solitary renal calculus in 4 cases. In 2 of the latter the symptoms produced by the solitary calculus were the only clinical symptoms of hyperparathyroidism. In 1 case the presenting symptoms were those related to vesical calculi, bilateral renal calculi being found on examination. In 2 cases hyperparathyroidism was suspected from a history of bilateral renal colics alone, no renal calculi being present at the time of examination. Fourteen of the patients had previously undergone a total of twenty operations for renal calculi. Nephrectomy had been performed on 2 of these, and 1 of the 2 had a permanent nephrostomy in the remaining kidney.

Symptoms Referable to the Skeleton.—Symptoms referable to the skeleton, when present, may vary exceedingly from vague or insignificant aches and pains to the disability and pain accompanying the pathologic fractures, cysts, tumors and deformities which occur in the classic bone disease of hyperparathyroidism. Pathologic fractures occurred in 5 of the 7 cases of classic bone disease. Biopsy revealed giant cell tumors (osteoclastoma) in 2 of these. The absence of gross deformities, loss of height and other evidences of severe osteitis fibrosa cystica generalisata in the cases here reported attests only the fact that the skeletal disease did not happen to be far advanced in these cases. Skeletal pain, backache or vague aches and pains in the muscles were present in all of the cases in which there was classic bone disease (group 1), in 3 of the 9 cases in which there was minimal bone disease (group 2) and in none of the cases without roentgenographic evidence of bone disease (group 3).

DIAGNOSTIC CRITERIA

The diagnosis of hyperparathyroidism at present depends on the demonstration of (1) an increase of calcium in serum, (2) a reduction of inorganic phosphorus in serum and (3) an increased loss of calcium in the urine.

Calcium in Serum.—The normal value of calcium in serum is 10.0 mg. per hundred cubic centimeters plus or minus 1.0 mg. Many authors have asserted that for a diagnosis of hyperparathyroidism to be warranted the level of calcium in serum must exceed 12.0 or 12.5 mg.

16. Allan, F. N.: Hyperparathyroidism: Report of a Case, *Proc. Staff Meet., Mayo Clin.* G: 684-686 (Nov. 18) 1931.

17. In agreement with the practice employed elsewhere, the cases in this and subsequent reports are numbered consecutively in the order in which the diagnosis was proved. The first 14 cases to be observed at the clinic were reported by Alexander and his associates.⁹ The first case comprising the present series is, therefore, number 15. Case 16 has been reported in detail elsewhere (Keating and Cook⁹).

18. Albright, Fuller; Baird, P. C.; Cope, Oliver, and Bloomberg, Esther: Studies on the Physiology of the Parathyroid Glands: IV. Renal Complications of Hyperparathyroidism, *Am. J. M. Sc.* 187: 49-65 (Jan.) 1934.

per hundred cubic centimeters.¹⁹ Albright and his associates³ in 1937 indicated that this is not the case, and our observations show that, by adherence to such standards, many cases of hyperparathyroidism would be overlooked.

The average levels of calcium in serum in the three groups of cases are shown in figure 2. The values are definitely higher in the cases of classic bone disease (group 1) than in the groups presenting minimal or absent bone disease, although plenty of overlap occurred. In 12 of the 24 cases the average concentration of calcium was less than 12.5 mg. per hundred cubic centimeters. In 4 cases (17 per cent) the average level of calcium fell within the normal range, while in 7 cases (29 per cent) one or more individual determinations fell within the normal range. It is apparent that the elevation of calcium need be very slight indeed. Repeated determinations over a period of time are often necessary to establish the significance of slight changes in suspected cases.

The concentration of calcium and consequently its diagnostic significance depend on the concentration of serum proteins.¹⁵ The total calcium includes two chief fractions, one of which is combined with serum protein as calcium proteinate, the other being ionic calcium. Calcium proteinate varies with alterations in the concentrations of proteins and is not primarily affected by parathyroid hormone. Ionic calcium is specifically affected by parathyroid hormone. Persons who have a lowered level of serum protein and normal total calcium may actually have significantly elevated ionic calcium. While neither fraction can be measured directly, both can be estimated from the concentration of total calcium and total protein by the use of the nomogram prepared by McLean and Hastings.²⁰ Certain conditions sometimes considered in differential diagnosis, notably multiple myeloma and sarcoidosis, are often accompanied by hyperproteinemia and by hypercalcemia secondary to the elevated proteins. In our experience serum proteins reduced sufficiently to mask hypercalcemia are rarely encountered as a diagnostic problem in patients having hyperparathyroidism. On the other hand, the demonstration of elevated proteins has been a relatively frequent means of avoiding an erroneous diagnosis of parathyroid disease.

Inorganic Phosphorus.—The normal level of inorganic phosphorus is 3.5 mg. per hundred cubic centimeters of serum plus or minus 0.5 mg. The average depression of the serum phosphorus is small, and considerable fluctuations of the concentration of inorganic phosphorus may occur in the same patient from time to time (fig. 2). One or more determinations fell within the normal range (3.0 to 4.0 mg. per hundred cubic centimeters) in 6 cases (25 per cent), and the average value of inorganic phosphorus was at the lower limit of the normal range in 4 cases (17 per cent). In several instances the depression of phosphorus was the best clue to the diagnosis, particularly when the value of serum calcium was equivocal.

Alkaline Phosphatase.—Albright and his associates³ have emphasized that elevation of alkaline phosphatase is a reflection of bone disease but not of hyperparathyroidism per se. This is clearly in agreement with our data (fig. 2). Abnormal levels of serum phosphatase occurred in all of the cases comprising group 1, minimal

elevation was observed in 2 of those comprising group 2 and with 1 exception all of those in group 3 had normal levels of alkaline phosphatase.

The assumption that the level of alkaline phosphatase in serum reflects osteoblastic activity in bone and not parathyroid function is further supported by the fact that, after removal of a hyperfunctioning parathyroid tumor, the phosphatase remained elevated long after the serum calcium, serum phosphorus and urinary excretion of calcium had returned to normal.

Urinary Excretion of Calcium.—The Sulkowitch test,²¹ brought into wide use by Albright, has proved useful as a rough measure of excessive excretion of calcium. It has been most helpful in ruling out hyperparathyroidism. Albright²² stated that its interpretation depends on the concentration of the urine, the previous diet, the age of the patient, the presence or absence of renal disease and other factors. In the absence of renal disease, a low level of excretion of calcium as indicated by the Sulkowitch test in a concen-

Fig. 3.—The excretion of calcium in the urine in patients with hyperparathyroidism. In most instances the quantity shown is the average excretion per day determined over a period of three to six days with the patient on a weighed diet low in calcium.

trated specimen of urine effectively rules out hyperparathyroidism.

The Sulkowitch test is performed by mixing an equal volume of urine and Sulkowitch reagent. The calcium present is precipitated when the test tube is inverted a few times. A minimal precipitate is called a grade 1 response and is considered to indicate a normal concentration of calcium. More pronounced calcinuria is graded 2, 3 or 4. This test was recorded in 15 of the cases in this series. In 1 case a grade 1 response was consistently elicited in the presence of pronounced polyuria. In 5 cases the precipitate was graded 2 and in 9 cases it was graded 3.

When the diagnosis is otherwise fairly obvious, a strongly positive Sulkowitch reaction which cannot be explained on other grounds has been considered as supporting the diagnosis of hyperparathyroidism; but in most instances it is preferable to determine quantitatively the excretion of calcium under known dietetic

conditions. The diet used by Bauer and Aub²³ has been employed and in most cases the excretion of calcium has been determined in three successive twenty-four hour specimens of urine and the average used. The diet employed contains 125 mg. of calcium per day. Most normal persons will excrete less than 100 mg. of calcium per day on this diet. Albright²² regards values between 125 and 200 mg. per day as highly suspicious and values in excess of 200 mg. as definitely abnormal. The values determined in the present series of cases are shown in figure 3.

Röntgenologic Findings.—In its most advanced form, osteitis fibrosa cystica generalisata resulting from hyperparathyroidism is characterized by widespread demineralization of the entire skeleton, pathologic fractures, multiple cystic regions, expanding tumors of bone and many sorts of skeletal deformities. Camp and Ochsner²⁴ in 1931 called attention to the characteristic

The patients comprising group 2 were so classified because the roentgenologic appearance of the skeleton lacked the characteristic features described. In 2 of the patients minimal demineralization of the hands and skull together with subcortical absorption cysts was present. In both cases, however, very extensive

Fig 5.—The hands in a case showing extensive bone disease (case 17). Despite relatively well calcified bones there are subcortical absorption of the phalanges and a pathologic fracture of a thumb, a biopsy of which showed osteoclastoma.

demineralization of the spinal column was accompanied by ballooning of the intervertebral disks. This observation, together with the presence of normal alkaline phosphatase, led us to surmise that in these cases hyperparathyroidism may have been complicated by senile osteoporosis and that the senile osteoporosis

Fig 6.—The skull in a case showing extensive bone disease. In addition to miliary osteoporosis of moderate degree there are disappearance of the tables of the skull and a circumscribed area of demineralization in the frontal region. The latter is an unusual finding.

roentgenologic appearance of the demineralized skeleton in hyperparathyroidism, the fibrous appearance of the long bones, the characteristic (but not of itself pathognomonic) miliary osteoporosis of the skull and the significance of subcortical cystic regions.

The cases in which there was classic bone disease (group 1) exhibited comparatively few of the most extensive bony changes. One patient had sustained almost innumerable pathologic fractures resulting from a coexisting malady accompanied by uncinate fits. Cyst-like areas in the long bones, the typical fibrous rearrangement of the trabecula, the characteristic changes in the skull and the diffuse demineralization were present in all 7 cases in this group (figs. 4, 5 and 6).

24. Camp, J. D., and Ochsner, H. C.: The Osseous Changes in Hyperparathyroidism Associated with Parathyroid Tumor: A Roentgenologic Study, *Radiology* 17: 63-69 (July) 1931.

was an independent entity not related to parathyroid hyperfunction. These cases will be reported elsewhere.

The remaining 7 patients comprising group 2 were reported by the roentgenologist as showing minimal osteoporosis of the skull. Changes in the remainder of the skeleton, if present, were too mild to be recog-

nized. In several of these cases, as a matter of fact, the presence of osteoporosis even in the skull was equivocal but, in order to separate clearly those cases without any evidence of skeletal disease from those having it, any case in which there was any question of minimal bone disease was arbitrarily assigned to this group for comparison. The patients comprising group 3 are so classified because the roentgenologic appearance of the skeleton was regarded as entirely normal in density and architecture.

Dental Roentgenograms.—The dental pathologic changes in hyperparathyroidism have been discussed by Borg,²⁵ by Stafne and Austin²⁶ and more recently by Strock.²⁷ These writers have emphasized the fact that in a number of instances of hyperparathyroidism the presenting symptoms have been the result of changes in the oral cavity. Strock called attention to the frequency with which epulis and malocclusion occurred. He also emphasized the characteristic ground glass osteoporosis and the loss of the lamina dura which was observed in the dental roentgenogram of such patients. No increase in dental caries has been observed in patients with parathyroid disease. Albright has emphasized the usefulness of the dental roentgenogram in the diagnosis of the bone disease of hyperparathyroidism and has particularly stressed the significance of the lamina dura.

Dental roentgenograms were made in 13 of our cases. The characteristic roentgenologic changes described by Strock were observed in all 4 of the cases in group 1 for which dental roentgenograms were available, and definite, although mild, changes were present in 2 of the 3 cases in group 2. In 6 cases from group 3, however, the dental roentgenograms, like those of the skeleton, were entirely normal. The most striking change in the roentgenograms of the jaws (fig. 7) was a pronounced and diffuse derangement of the normal osseous pattern associated with evident diffuse demineralization. There was complete disappearance of the lamina dura in the 2 most severe cases in group 1 but only partial disappearance in the remainder. One case showed cyst formation.

Mild degrees of osteoporosis may be detected more readily in the dental roentgenograms than elsewhere because the teeth, the density of which is unaffected by hyperparathyroidism, serve as indexes of opacity (fig. 7). Since disappearance of the lamina dura is observed in several purely dental conditions, this criterion is significant only if associated with diffuse demineralization and obvious derangement of the bony architecture.

Urologic Features.—Urologic examination of these patients did not disclose any findings which could be regarded as truly pathognomonic. Renal calculi, when present, were multiple or single, unilateral or bilateral (fig. 8). A majority of the patients having renal calculi also had infection of the urinary tract, often of serious proportions. Infection seemed related chiefly to the extent and duration of the renal calculi.

It has been generally assumed that renal calculi resulting from hyperparathyroidism consist of calcium and phosphorus, since both of these substances are excreted in excessive quantities. Calculi were analyzed qualitatively in 9 of our cases. In 6 of them the stones

were reported to consist mostly of calcium oxalate. In 1 case the stone consisted of calcium phosphate; in another, of calcium phosphate and oxalate, and, in another, of calcium phosphate and carbonate. This surprising predominance of oxalate stones has been observed also by Albright.

In 4 cases the roentgenograms disclosed diffuse miliary calcification involving the parenchyma of both kidneys. Two of these had in addition discrete stones in the renal pelvis and a history of renal colics. In the

Fig. 7.—Dental roentgenograms in hyperparathyroidism: a, appearance of the mandible in 1939, one year before the first symptoms of hyperparathyroidism appeared; the osseous structure is normal and the lamina dura intact. b, the same case (case 33) in 1944 prior to removal of a parathyroid adenoma; at this time typical generalized skeletal involvement was present; the mandible shows generalized demineralization, distortion of the bony architecture and disappearance of the lamina dura. c, the same area in 1945, six months after removal of the parathyroid adenoma; the bone still shows abnormal structure but there has been visible recalcification and the lamina dura is reappearing. d, an example of more extensive dental changes encountered in another case; in addition to the changes described previously there is disappearance of the roots of the molar teeth as the result of encroachment of a cyst-like tumor in the mandible.

other 2 there was no definite evidence of stones and no history referable to the urinary tract. It is presumed that these cases represent nephrocalcinosis, which

Albright and his associates¹⁸ have shown to be capable of producing serious and at times irreversible renal insufficiency. Demonstrable urinary insufficiency, as evidenced by an elevated level of urea in the blood, occurred in 2 of the 4 cases. Severe renal insufficiency was encountered in another patient without visible calcification of the kidneys (patient 15); the urea clearance was 12 cc. per minute. The remarkably low excretion of calcium (40 mg. in twenty-four hours) and relatively normal blood values (calcium 10.8 mg., phosphorus 2.8 mg.) may perhaps be attributed to the impaired renal function, since by any other standard the parathyroid disease was most severe.

Albright and his associates¹⁸ have emphasized that serious renal damage, resulting from nephrocalcinosis, secondary pyelonephritis or obstruction by stones, is the most important change produced by hyperparathyroidism and the most pressing reason for early diagnosis and treatment. Well authenticated cases have been

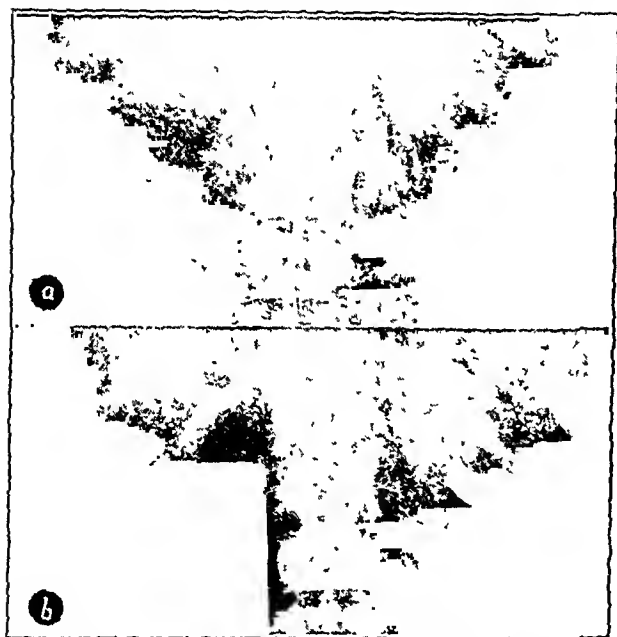

Fig. 8—Appearance of the renal calculi in a patient with hyperparathyroidism without bone disease. The roentgenograms, made five months apart, show the rapidity with which the calculi enlarged in this instance.

reported in which the urinary insufficiency resulting from hyperparathyroidism was the cause of death, and there is reason to believe that the renal damage may lead to a fatal issue either directly²⁴ or indirectly²⁵ even after excision of the hyperfunctioning parathyroid lesion and correction of the metabolic disorder.

ANATOMIC DIAGNOSIS

Proof of the existence of hyperparathyroidism in a patient having clinical or chemical criteria of the disease depends on the anatomic demonstration by the surgeon of an adenoma or hypertrophy of parathyroid tissue. In all 24 cases in this series a parathyroid tumor was found at operation. In case 23 two tumors were found. No instance of primary hypertrophy of all parathyroid tissue²⁶ has been encountered in our series.

In all cases the tumor was situated in the neck, although in only 3 was it definitely palpable before operation. During the period during which these patients were observed, exploration was performed on 6 other patients for a hyperfunctioning parathyroid lesion without a tumor being found. In 2 cases both cervical and mediastinal explorations were carried out despite strong suspicions that secondary hyperparathyroidism was present. In 1 of these parathyroid biopsy showed secondary hyperplasia, and despite the absence of pathologic proof we suspect that a similar condition may have been present in the other. In another 2 cases evidence of hyperparathyroidism was clearcut, and despite the lack of surgical findings it is felt that the diagnosis may be still correct. In these cases it is thought likely that a tumor might be located in the mediastinum, but in neither case has mediastinal exploration thus far been undertaken. In the remaining 2 cases exploration was undertaken because of severe and prolonged nephrolithiasis and minimal chemical changes in the blood and urine. The failure to find parathyroid tumors plus the inconclusive character of the chemical evidence leaves considerable doubt regarding the diagnosis of hyperparathyroidism.

None of the tumors removed in our series were located in the mediastinum. It is possible that a mediastinal lesion is present in the 2 patients mentioned previously. In addition, the persistence of signs and symptoms of hyperparathyroidism in 1 of the patients from whom one tumor was removed is taken as suggesting that an undiscovered mediastinal tumor may also have been present. There has not thus far been an opportunity to confirm or disprove this supposition in these 3 cases by mediastinal exploration. In Cope's large experience³¹ mediastinal lesions have been encountered in 20 per cent of patients having hyperparathyroidism. We have no ready explanation for the apparent infrequency of mediastinal lesions in our material.

Histologically the tumors examined contained all of the types of cells common to the normal parathyroid gland, although one or another of these usually predominated. No evidence of extension, invasion or distant metastasis was observed. Disagreement exists as to the histologic classification of these growths.³² Hyperfunctioning parathyroid tumors which show unequivocal clinical evidences of malignancy do occur but are exceedingly rare. Alexander and his associates⁹ discussed cellular changes, which, in their opinion, warranted a diagnosis of adenocarcinoma in 13 of the 14 cases of parathyroid tumor in their series. Castleman and Mallory³³ have observed similar cellular changes but do not consider them to be sufficient evidence on which to make a diagnosis of carcinoma. They classify all the tumors which they have observed as benign adenomas. Irrespective of the different interpretations given to the cellular characteristics of these growths, it is generally agreed that the great majority of them are clinically benign and lack the clinical characteristics usually associated with malignant neoplasms. They rarely recur, invade or metastasize, but there have been a very few isolated instances in which distant

metastasis or local recurrences have eventually been observed.³⁴

Following surgical ablation of the parathyroid lesion, the level of calcium in serum falls rapidly to normal in a day or two (fig. 9). The level of inorganic phosphorus returns to normal more gradually. When these changes do not occur, one can suspect that the hyperfunctioning tissue has not been completely removed.

Postoperative Parathyroid Tetany.—Symptoms of tetany sufficiently noticeable to require treatment occurred in 4 of the cases of classic bone disease. In only 1 was the tetany severe; in the remaining 3 it was so mild that treatment with small quantities of calcium by mouth promptly controlled it. Minimal symptoms of tetany (transient tingling, numbness or positive Chvostek's sign) not requiring treatment occurred in 2 other cases of classic bone disease, 2 cases of minimal bone disease and 4 cases without evident bone disease. In the remaining 50 per cent of the cases (1 in group 1, 7 in group 2 and 4 in group 3) there were no symptoms of tetany whatever.

The only instance of severe and intractable tetany occurred in the patient with the most obvious osseous disease and the highest levels of alkaline phosphatase. Albright¹⁵ stated that he has encountered this dangerous complication only in such patients, usually persons in whom the level of alkaline phosphatase before operation exceeded 20 Bodansky units.

The mild or minimal degrees of tetany which sometimes occur transiently for a few days after operation may reflect a temporary state of hypoparathyroidism (relative or absolute) resulting from the functional atrophy or hypoplasia of the remaining parathyroid tissue. On the other hand, such symptoms may represent the reaction of the body to a sudden shift of the equilibrium of calcium and phosphorus to which it had previously been adjusted.

The severe and intractable tetany encountered in cases of severe bone disease appears to be of quite a different character. In these cases the skeleton is the site of intensive osteoblastic activity as well as demineralization. Albright suggested that extirpation of the parathyroid lesion brings to a halt the release of calcium from bone but does not immediately affect the intensive osteoblastic activity. This persistent attempt at repair of bone appears to create a situation in which the hungry bones seize on all the calcium available with such avidity that disastrous tetany results.

COMMENT

To an unparalleled degree the diagnosis of hyperparathyroidism requires that a special search be made for the condition. The early symptoms are notoriously vague and seldom pathognomonic, and in many cases without evident bone disease there may be no symptoms aside from those produced by renal calculi. In other words, until the disease manifests itself by something fairly spectacular, such as renal colic, there is little likelihood that it will be recognized early.³⁵ When the chemical abnormalities in the blood and urine are conspicuous, the diagnosis, once suspected, can be established with ease. In many cases, however, the chemical

changes are minimal and their significance cannot be ascertained without repeated analysis of the blood and urine and prolonged observation of the patient. Conversely, in many suspects who do not have the disease we have found it difficult to rule out hyperparathyroidism except by prolonged study.

Barney and Mintz³⁶ stated in 1936 that hyperparathyroidism was the etiologic factor in 4 to 5 per cent of the cases of renal calculus which they observed. In 1938 Griffin, Osterberg and Braasch,³⁷ from the routine analysis of serum calcium and phosphorus in cases of renal calculi, came to the conclusion that the incidence of hyperparathyroidism in such cases was less than 0.2 per cent. Subsequent experience indicates that this figure is too low. In retrospect it is now apparent that, using the criteria then employed (namely single determinations of calcium and phosphorus and too broad a conception of "normal" values), many cases of hyperparathyroidism would have been overlooked.

Fig. 9—The changes in the average level of calcium in serum before and after removal of a parathyroid tumor. Each point represents the average of numerous determinations made, in most instances, over a period of several weeks. In 1 case (case 19) in group 3 no significant change in serum calcium occurred following operation. The level of inorganic phosphorus and excretion of calcium were also unchanged, and this has been assumed to indicate that a second tumor is probably present.

Cope has stated that between 10 and 15 per cent of the patients with renal calculi investigated personally by himself or by Albright are eventually proved to have hyperparathyroidism as the cause. No definite conclusion can be drawn from our data as to what proportion of the renal calculi seen at the clinic are the result of hyperparathyroidism. The cases in this report represent an incidence of hyperparathyroidism in approximately 2 per cent of the patients seen with renal calculi during the same period.³⁵ The incidence would have been higher had all patients with renal calculi been investigated thoroughly during the period covered by this report. Regardless of what figure is eventually deter-

³⁵ Albright has discussed the interesting possibility that hyperparathyroidism might be encountered in the absence either of skeletal involvement or of renal calculi. We have recently observed such a case, in which hypercalcemia, hypophosphatemia and hypercalciuria were discovered quite by accident. After prolonged observation, a parathyroid tumor was removed. There were no symptoms or signs whatever which could be attributed to the hyperparathyroidism.

mined, it is apparent that hyperparathyroidism is an important and often neglected consideration in the management of patients with renal calculi. On the other hand, renal calculi have many causes and it is obvious that for every case of renal calculi found after careful study to be a consequence of hyperparathyroidism there will be many others in which this diagnosis can be excluded.

In approximately 10 per cent of all cases of renal calculi recurrent or multiple calculi eventually develop. It is reasonable to suppose that hyperparathyroidism may prove to be a factor of considerable importance in this group of cases. A persistent search for parathyroid disease will materially simplify the management of some patients seen with this difficult and serious problem.

Aside from its clinical importance, hyperparathyroidism without evident bone disease provokes speculation as to the relation of the parathyroid hormone to bone metabolism. Irrespective of other considerations it is evident that whether or not in a case of hyperparathyroidism a visibly demineralized skeleton develops depends on the calcium balance. One might suppose that a negative balance of significant degree would be most likely to occur in hyperparathyroidism of long standing. A comparison of the duration of symptoms in the various groups (fig. 1) throws strong doubt on the concept that patients without osteitis fibrosa cystica do not have classic bone disease because they have not been ill long enough.

Other factors being equal, the calcium balance would be most likely to be negative in patients with the greatest excess of parathyroid hormone. If the average level of serum calcium can be taken as a rough index of the severity of hyperparathyroidism, our observations would suggest (fig. 2) that hyperparathyroidism is more severe in the cases in which there is classic bone disease. Comparison of the measured calcium output (fig. 3) is a little suggestive that more calcium is lost in the urine in these cases as a group. These observations are in agreement with Albright's experience, although he has observed a number of instances in which hyperparathyroidism without bone disease was, by all standards, just as severe as examples of the classic type.

The quantity of calcium in the diet also affects the probable calcium balance. Persons with a high level of calcium in the diet (for example, milk drinkers) are less likely to have a negative calcium balance in the presence of hyperparathyroidism than persons whose intake of calcium is low. Albright has felt that this factor accounted for the absence of bone disease in his patients. However, we have seen a number of such patients whose previous diet contained calcium in relatively small quantities. The existence of a relatively intact skeleton in those patients implies calcium equilibrium in the presence of sustained hypercalcinuria, despite small quantities of ingested calcium. In these instances calcium equilibrium may be aided by more efficient absorption of calcium from the gastrointestinal tract. Whether such increased efficiency of absorption is fortuitous or related to the parathyroid disease would be interesting to discover.

SUMMARY

Twenty-four cases of hyperparathyroidism have been observed at the Mayo Clinic in a period of less than two and a half years. In the preceding fourteen years only 14 cases were encountered. The increased incidence is entirely a reflection of a higher index of suspicion and revision of the criteria necessary to make the diagnosis.

In 7 of these cases there was classic osteitis fibrosa cystica generalisata. In 9 there was mild or atypical bone disease and in 8 there was no evidence of bone disease whatever. Calcification of the kidneys or renal calculi occurred in 22 of the 24 cases, an incidence of 92 per cent. In 18 cases (75 per cent) symptoms produced by renal calculi were the chief clue to the diagnosis.

The diagnosis depends on the demonstration of an increase of calcium and a reduction of inorganic phosphorus in the serum as well as increased excretion of calcium in the urine. These changes may be slight, and prolonged study is frequently required to establish their significance.

On the basis of these data we wish to reemphasize the conclusions of Albright and his colleagues that (1) hyperparathyroidism is more common than generally supposed, (2) renal involvement is more frequent and diagnostically more important than osseous involvement and (3) every patient who has renal calculi should be suspected of having hyperparathyroidism until the contrary is clearly proved or until some other etiologic factor clearly can be demonstrated.

RELAPSING FEVER

REPORT OF A SPORADIC OUTBREAK, INCLUDING
TREATMENT WITH PENICILLIN

CAPTAIN WILLIAM C. TAFT

AND

CAPTAIN JOHN B. PIKE

MEICAL CORPS, ARMY OF THE UNITED STATES

Relapsing fever in the United States is a sporadic disease, and seldom does the opportunity present itself to study the clinical manifestations and therapeutic problems which arise in a significant number of cases. During August and September 1944 and April and May 1945, 11 proved cases of relapsing fever were observed and treated at an army hospital in Texas. These 11 cases demonstrated several interesting and important features from a diagnostic and therapeutic standpoint. Among these features to be discussed in detail are (1) the difficulties in diagnosis, (2) the high incidence of neurologic involvement and (3) the ineffectiveness of the accepted treatment in contrast to the striking response obtained with newer methods of therapy.

GENERAL CLINICAL PICTURE

Six patients entered the hospital with an admission diagnosis of "nasopharyngitis"; 3 had diagnoses of "hyperpyrexia," "recurrent malaria" and "headache and nausea." 1 entered the surgical service with cellulitis of his left index finger and developed his first febrile episode while undergoing treatment of the cellulitis and 1 entered with scarlet fever and developed an attack of relapsing fever while acutely ill with the former disease.

All the patients, except the final one whose presenting symptoms were those of scarlet fever, gave a history of a sudden onset of illness with weakness, vertigo, fever, headache and backache on the day prior to admission. Six had nausea and 4 vomited. On admission all appeared to be acutely ill, with extreme prostration. They complained bitterly of violent frontal headache, fever, backache and muscular weakness. Physical examination revealed a flushed face, mildly injected pharynx, temperature 104-105 F., pulse rate 120-130 per minute and respiratory rate 20-24 per minute. Three patients

had abdominal tenderness, periumbilical and in the right and left lower quadrant and 3 had abnormal neurologic signs consisting of nuchal rigidity, a positive Kernig's sign and absent abdominal reflexes. Blood counts varied from normal to an initial leukocytosis of 17,000 with a concomitant increase in polymorphonuclear leukocytes. Urinalyses were essentially negative. In no case were the abnormalities found on physical examination or preliminary laboratory work commensurate with the severity of the clinical picture.

Three or four days after the onset of symptoms the fever, headache, tachycardia and backache suddenly disappeared and the patients felt well. At the end of the first febrile episode, 7 of the 11 patients had a palpable spleen. On the second or third day after the temperature returned to normal, 5 of the patients developed a well defined skin eruption.

From the termination of the first febrile episode, the patients were asymptomatic for six to eight days. They then began to complain of headache, backache, weakness and drowsiness and within a few hours they had high fever, prostration and a clinical picture identical with that on admission. This second episode ran essentially the same course as the first, with the exception that the signs lasted twenty-four to forty-eight hours while the symptoms persisted for a variable number of days. The patients continued to complain of backache, headache and weakness, although physical examination at this time revealed no abnormalities. In 10 of the cases the first two febrile episodes were similar. In the final case, in which both scarlet fever and relapsing fever were present, no second episode occurred. Thereafter the course of the disease varied somewhat, being modified apparently by treatment. The later stages of the disease will be described when the treatment is discussed.

Prominent in the general clinical picture was the prolonged course and long convalescence of the patients treated with oxophenarsine hydrochloride (mapharsen). No patient was hospitalized for less than one month. The longest period was one hundred and ten days. This patient developed mumps during his convalescence, which increased his hospital stay somewhat. Most of the patients were in the hospital or convalescent training program for fifty to sixty days. The reason for the long hospitalization was chiefly the profound asthenia, which persisted long after all real symptoms and signs of the disease had disappeared. During convalescence, patients were mentally depressed, felt weak, had frequent headaches and backaches and felt that they were not well enough for duty.

In a number of the individual cases there appeared some specific clinical manifestations which will be discussed here.

On the second or third day following the termination of the first febrile episode, 5 of the patients developed a skin eruption. This consisted of dime (18 mm.) to quarter (24 mm.) sized rose red spots which appeared on the trunk, legs and arms. These lesions were circular, were sharply demarcated, blanched on pressure and were not elevated above the surrounding skin. They had the appearance of an erythema multiforme and persisted for twenty-four to forty-eight hours.

Significant neurologic manifestations appeared in 5 of the patients. Headache, backache, nuchal rigidity, absent abdominal reflexes and fever were so prominent as to suggest a diagnosis of meningitis. Spinal fluid examination on these patients did not substantiate this suspected diagnosis. In several patients signs of menin-

geal irritation appeared during more than one of the recurrent attacks. Not only was there evidence of neurologic disease early, but in 5 of the patients an important neurologic complication of relapsing fever presented itself during the later stages of the disease. This consisted of paralysis of the seventh cranial nerve, occurring after the second or third relapse. It appeared approximately forty-eight hours after the termination of the febrile episode. Two of the patients had a right facial palsy, 2 a left facial palsy and 1 a bilateral facial palsy.

DIAGNOSIS AND LABORATORY FINDINGS

The diagnosis of the disease in the initial or sporadic case is difficult. It can be established only by finding the causative organism, which was in these cases the spirochete *Borrelia recurrentis*. The spirochete may be found by dark field examination or stained smear of the patient's peripheral blood. In these cases the spirochete was found in the peripheral blood only during the febrile episode with the patient's temperature above 102 F. In all patients the spirochete was found both on dark field examination and by examination of thick and thin smears stained with Wright's stain.

On 1 patient a biopsy of one of the skin lesions was performed and sections stained by Levaditi's method revealed the causative spirochetes in the superficial layers of the dermis. It is interesting to note that these spirochetes were found in the skin during an afebrile period of the disease. In no other case were spirochetes demonstrated anywhere during an afebrile period.

In addition, various other laboratory studies were done. In no case was the spirochete found in the urine or spinal fluid either by direct examination or by mouse inoculation. Blood cultures were negative. Agglutinations with proteus OX19 (Weil-Felix reaction) were negative. Blood and spinal fluid Wassermann and Kahn reactions were negative.

Blood counts are in no way specific, and in these patients the initial white blood count ranged from 5,850 with 65 per cent polymorphonuclears to 17,000 with 74 per cent polymorphonuclears. Five of the 11 patients had on admission white blood counts below 10,000; with normal differentials.

Sedimentation rates were determined in 4 cases, and in all were rapid. Rates ranged from 18 to 40 mm. per hour and quickly returned to normal with subsidence of the disease.

Six patients showed a 1 plus albuminuria with a few red and white cells. Repeat urinalyses were essentially negative.

Lumbar punctures were accomplished in 5 patients. In 2 the spinal fluid was normal, and neither of these patients developed any neurologic complication. The remaining 3 cases presented spinal fluids with abnormally high protein values, 120 and 60 and 56 mg. per hundred cubic centimeters respectively. These 3 patients, together with 2 others on whom no lumbar puncture was done, developed seventh nerve palsies, suggesting that there may be some correlation between the presence of abnormal amounts of protein in the spinal fluid and subsequent neurologic involvement.

TREATMENT

The treatment described for relapsing fever is the intravenous injection of an arsenical preparation given most effectively before the fastigium of a febrile episode is reached. According to most of the available literature, such treatment supposedly terminates the attack and

prevents additional relapses. Occasionally the arsenical has needed reinforcement by intramuscular bismuth, but in these cases supposedly adequate treatment was neither so simple nor so effective.

Seven of the patients received 0.04 Gm. of oxophenarsine hydrochloride intravenously at the beginning of a relapse, before the temperature had reached its expected peak. In all 7 cases the results were spectacular. The patient immediately had a chill, accompanied by extreme malaise, apprehension, nausea, vomiting and temperature rise to 104 to 105 F. The symptoms and signs did disappear about eight hours following the administration of the arsenical, thereby shortening the relapse. Although this single dose of oxophenarsine hydrochloride shortened the acute episode, it did not ordinarily prevent subsequent ones. After the first two relapses the periods of time between them began to vary, each occurring from seven to fourteen days after the preceding one. They also began to vary in intensity. In most cases after the third relapse the subsequent ones showed less febrile reaction, but the complaints of headache, backache and weakness were as severe as during the first few episodes. Eventually many of the patients had what appeared to be "symptomatic" relapses. These were periods of time lasting twenty-four to forty-eight hours during which patients had severe headache, backache and weakness but had normal temperature, pulse and respirations. These symptoms occurred just at the time of the expected relapse. During these symptomatic relapses several had spasm of the muscles of the lower part of the back.

After the patients had had several single doses of oxophenarsine hydrochloride and still continued to relapse, it was decided to give a course of arsenic and bismuth therapy. Five of the patients received this. It consisted of oxophenarsine hydrochloride 0.04 Gm. intravenously twice weekly and bismuth subsalicylate intramuscularly once weekly for three weeks. After this course was begun none of the patients had febrile reactions, but all had one or more symptomatic relapses. None had recovered from the disease when this course was finished.

In 1 case an injection of oxophenarsine hydrochloride during each of the first two febrile episodes terminated the disease. In another case a single injection of oxophenarsine hydrochloride during the third relapse cured the patient. The first two febrile episodes in this patient had been undiagnosed. In a third case oxophenarsine hydrochloride was given during the first relapse, three days later, and during the second relapse. Following these three injections the patient gradually improved but required three weeks to become symptom free. The remainder of the arsenic treated patients did not respond as well as this and continued to relapse. Since oxophenarsine hydrochloride, even in combination with bismuth, proved to be inadequate in controlling the disease and its debilitating effect, penicillin was tried on the last patient in the 1944 series. On Oct. 2, 1944 this patient received 20,000 units every three hours intramuscularly for a total dosage of 100,000 units. The penicillin was given during a relapse. This amount had no apparent effect on this relapse nor did it prevent subsequent ones. This patient had a total of six relapses, each of diminishing intensity after the first three, which were identical. It was felt at the time that this was a small dose of penicillin, but a larger amount of the drug was not immediately available. Although this penicillin treatment was a failure, it was still thought that adequate dosage with penicillin would

prove effective. Accordingly when the last 2 patients of this series were encountered, penicillin was again used. These last 2 patients appeared in April and May 1945 and each received 40,000 units of penicillin intramuscularly every three hours for sixty doses, making a total dosage of 2,400,000 units. The immediate response to the first two injections of penicillin was a sudden increase in fever and malaise and a feeling of apprehension. This appeared to be a Herxheimer reaction, possibly due to the sudden destruction of large numbers of spirochetes. Both patients were afebrile within seventy-two hours after starting penicillin, and neither developed febrile or symptomatic relapses thereafter. All signs of the disease rapidly disappeared during the therapy. The splenomegaly quickly regressed, and the patients had recovered within two weeks after the penicillin therapy was completed.

The last patient treated had scarlet fever concomitantly with his relapsing fever. Penicillin in this case not only was curative for his relapsing fever but was apparently beneficial to his scarlet fever. Intravenous arsenicals were probably contraindicated in this patient, and untreated relapsing fever in a patient acutely ill with scarlet fever might well have produced serious consequences.

The remaining points of importance in the therapeutic management are obvious: symptomatic relief of headache, backache and malaise by codeine and acetylsalicylic acid, the maintenance of adequate fluid balance and the full utilization of physical therapy for those patients who developed Bell's palsy. Most of the facial palsies responded to physical therapy within two weeks, but one lasted two months. Recovery was eventually complete in all cases.

EPIDEMIOLOGY

Epidemiologic studies were done after the diagnosis of relapsing fever was made. It was known that the chief carrier of the spirochete of relapsing fever in Texas is the tick. It was not known where to find the infected ticks. Close questioning disclosed that all patients suffering from the disease had, shortly before their admission, been camping at a bivouac area near the army field where the cases appeared. The bivouac area was explored and many ticks of all ages and sizes were found. The ticks were living in the earth around the sides and in the floors of small animal burrows. The ticks were all of one species and were identified as *Ornithodoros turicata*, a tick common in Texas. None of the patients gave a history of tick bite, but all gave a history of sleeping on the ground in one area of the bivouac on the sixth or seventh day prior to the beginning of their illness. In almost all cases it was the sixth day. This offered some information on the incubation period of the disease as well as indicating the area from which the infection came. Eventually ticks infected with the spirochete of relapsing fever were found in that area.

COMMENT

Relapsing fever in this country in general is not an important disease except to the individual who contracts the infection. If untreated or inadequately treated, the morbidity is great. The patient faces from two to six or more severe febrile episodes over a period of a month or more and in addition a long period of mental depression, muscular asthenia, headache and backache.

In this group of patients, arsenical treatment was not ideal in combating the Texas strain of relapsing fever. In sharp contrast to this method of treatment, penicillin in large doses gives promise of a more satisfactory

therapeutic result. It has in 2 instances produced a rapid subsidence of symptoms and signs, prevented subsequent relapses and eliminated the protracted convalescence characteristic of patients otherwise treated.

The dosage of 2,400,000 units was chosen arbitrarily because of its remarkable success in the treatment of another spirochetal disease—syphilis. Smaller amounts might be sufficient to effect a cure, but the opportunity to test the efficacy of various doses has not yet presented itself.

No serious complications incident to the disease or to the penicillin treatment were encountered.

CONCLUSIONS

Consideration of these 11 cases of relapsing fever suggests the following conclusions:

1. Penicillin in a dosage of 2,400,000 Oxford units is effective in the treatment of the disease.
2. Penicillin reduces the length of disability from the disease to a minimum.
3. Arsenicals, with or without bismuth, produced disappointing therapeutic results.
4. Spirochetes may be demonstrated in the skin during an afebrile period.
5. Neurologic disorders play a prominent role in the natural history of the disease.

THE TREATMENT OF LUNG ABSCESSSES WITH PENICILLIN

REPORT OF FOUR CASES

CHARLEY J. SMYTH, M.D.

AND

THOMAS H. BILLINGSLEA, M.D.

ELOISE, MICH.

Despite recent advances in chemical and surgical therapy, the treatment of lung abscesses remains an important problem. The sulfonamides, pneumothorax, phrenic nerve avulsion, bronchoscopy and postural drainage have all proved to be of definite, but limited, value. The surgical treatment of lung abscesses, particularly the chronic type, still is attended by a high fatality rate. The sulfonamides have not proved to be effective except in the control of the associated pneumonitis. In the relatively short time since penicillin has been available, a few lung abscesses have been treated with this new drug. The response in some of these cases has been excellent. Recently 4 patients suffering from lung abscesses have been treated in the Wayne County General Hospital, Eloise, Mich., with penicillin. Our purpose in this communication is to review the previously reported cases of lung abscesses treated with penicillin and to present the cases which we have observed during the past twenty months.

In a review of the literature we have found reference to 31 cases of lung abscesses which have been treated with penicillin. Thirteen were cured, 8 improved and 10 were not benefited. The accompanying table summarizes these cases and includes most of the pertinent data presented in each case in the original report.

We have been encouraged by the satisfactory recovery of 4 patients with lung abscesses whom we have treated with the long-continued intramuscular administration of penicillin. Two of the patients had acute pulmonary

infection with cavitation, 1 developed a lung abscess following an embolus from thrombophlebitis of the leg and the other patient had chronic lung abscesses.

The treatment in each of these cases has consisted of penicillin given every three hours day and night. The site of the injections has been the deltoid and gluteal muscle groups and the individual injections were made using these sites in rotation. The following is a summary of these cases:

REPORT OF CASES

CASE 1.—History.—M. J., a white man aged 39, a barber, was admitted to the hospital on March 27, 1945 with a cough and weakness for about three weeks. For a few days he had had symptoms which he thought were due to a "head cold." He had noticed generalized aches and pains and at times he felt feverish. At one time he recorded his temperature at 103 F. The cough became increasingly productive and the day prior to admission he coughed up a half cup of dark brown sputum. Since the onset of symptoms he had had no appetite and had lost 15 pounds (6.8 Kg.) in weight.

Physical Examination.—On admission the temperature was 101 F., the respiratory rate 24 per minute and the pulse rate 108 per minute. The patient was pale but did not appear acutely ill. There was increased tactile fremitus and impaired resonance over the right upper lobe posteriorly, associated with inconstant crepitant rales. The breath sounds over this area were bronchovesicular in quality. The remainder of the physical examination was essentially negative.

Laboratory Data.—The hemoglobin was 12.0 Gm., the red blood cell count 3,560,000 per cubic millimeter and the white blood cell count was 13,150 per cubic millimeter. The sputum was negative for acid fast bacilli on four examinations, and when cultured it exhibited a predominance of *Streptococcus viridans*, hemolytic streptococci and some micrococci. A sputum specimen obtained at the time of bronchoscopy was cultured and *Neisseria catarrhalis* and *Streptococcus viridans* were recovered.

Röntgenograms.—The roentgenographic changes are illustrated in the sketches in figure 1. A chest roentgenogram taken on March 27, 1945 showed an area of pneumonitis in the right upper lobe within which there was an area of rarefaction 2 cm. across with a fluid level. A subsequent roentgenographic examination of the chest on April 24 revealed minimal residual pneumonitis in the right first interspace in the area where the cavity was originally seen, and a roentgenogram taken on June 5 was interpreted as showing "generalized increase in bronchovascular markings but no evidence of active lung pathologic change." The last roentgenogram, taken on August 2, revealed "no cavity in the right upper lobe."

Hospital Course.—On the first hospital day he was given sulfadiazine by mouth. The initial dose was 2 Gm. and subsequent doses were 1 Gm. every four hours. Postural drainage was initiated on the second hospital day. On the fourth hospital day sulfadiazine was discontinued and penicillin 50,000 units every three hours was given by the intramuscular route and continued at that dose for three days; then the size of each dose was decreased to 15,000 units every three hours for eleven days. Each individual dose was then raised to 25,000 units and given intramuscularly every three hours for the next fifteen days, and 15,000 units every three hours was given intramuscularly until the time of discharge from the hospital. The total amount of penicillin which he received during this thirty-six day period was 6,300,000 units. The patient's admission weight was 145 pounds (66 Kg.) and increased progressively until the time of discharge, when his weight was 164 pounds (74 Kg.). The temperature, which never rose above 101 F., returned to normal on the fourth hospital day and has remained normal. The amount of sputum on the day following admission was 318 Gm. and decreased progressively thereafter, being 150 Gm. on the sixth hospital day, 100 Gm. on the twelfth hospital day and 10 Gm. on the day he went home. This man is employed at the hospital as a barber, has completely recovered and is working full time.

Summary of Reported Cases of Lung Abscess Treated with Penicillin

Reference	Diagnosis	Age and Sex	Duration of Disease, Days	Penicillin Dosage, Total Units	Length of Treatment, Days	Comment
Reefer, O. S.; Blake, F. G.; Marshall, E. K., Jr.; Lockwood, J. S., and Wood, W. B., Jr. J.A.M.A. 122:1217 (Aug. 28) 1943	Lung abscess		No data reported			Three cases; no detailed information; 2 showed recovery or improvement, 1 died
Lyons, C. Ibid 123:1007 (Dec. 18) 1943	Lung abscess		No data reported			Four cases; no detailed information; penicillin was without effect on 2 patients with "putrid" lung abscess; 2 pyogenic streptococcus lung abscesses were healed

** Satisfactory improvement

*** Complete recovery

This man had an acute pulmonary abscess for which he received 6,300,000 units of penicillin by the intramuscular route, beginning relatively early following the onset of his pulmonary symptoms. He never appeared to be particularly ill, and the lesion, which was diagnosed early, showed progressive diminution in size and

Fig. 1 (case 1).—Clinical course in a patient with an acute lung abscess who was treated with penicillin. Note that sketches of the roentgenograms do not correspond to the day of the illness.

was absent by the end of the fourth week of treatment. It has now been three months since his discharge from the hospital, and there has been no evidence of recurrence of the abscess. It is impossible to say that this lesion would not have regressed spontaneously; however, considering the size of the lesion and the rapidity with which it developed, it seems to us unlikely that complete resolution would have taken place without the use of some chemotherapeutic agent. We believe that penicillin decidedly shortened the clinical course of this patient's illness.

CASE 2.—History.—J. H., a white man aged 45, a mentally deteriorated parietic inmate of the Psychiatric Division of the Eloise Hospital, was admitted to the General Hospital Division of the Wayne County General Hospital on Aug. 16, 1944, at which time no reliable history was obtainable. He had lost con-

Fig. 2 (case 2).—Clinical course following penicillin therapy in a patient with acute lung abscesses. Note that the illustrations of the roentgenograms and the bronchogram do not correspond to the day of the illness.

siderable weight during the two weeks prior to admission, his temperature had been elevated, and it was noticed that his breath was foul.

Physical Examination.—At the time of admission the temperature was 99.6 E., the pulse rate 88 per minute and the respiratory rate 38 per minute. He was poorly developed and

appeared chronically ill. He coughed frequently and held his hand over his right chest. The sputum which he coughed up was yellow and had a very foul odor. There was increased tactile fremitus, with dullness over the entire right hemithorax and coarse rales over the right middle lobe.

Laboratory Data.—The blood count on the first hospital day was hemoglobin 11 Gm., red blood cells 3,670,000 per cubic millimeter and white blood cells 23,300 per cubic millimeter. Sputum studies revealed *Streptococcus viridans*, *Neisseria catarrhalis* and *Staphylococcus aureus*, but no acid fast bacilli were found.

Roentgenograms (fig. 2).—On August 14 roentgenograms of the chest revealed the presence of two cavities in the right midlung field, each of which had a fluid level; the largest measured 4.5 cm. across. There was a small area of pneumonitis about each of these cavities. Lateral view of the chest showed the abscesses to be in the posterior portion of the chest in the apex of the right lower lobe. Another roentgenographic examination on October 20 revealed evidence of

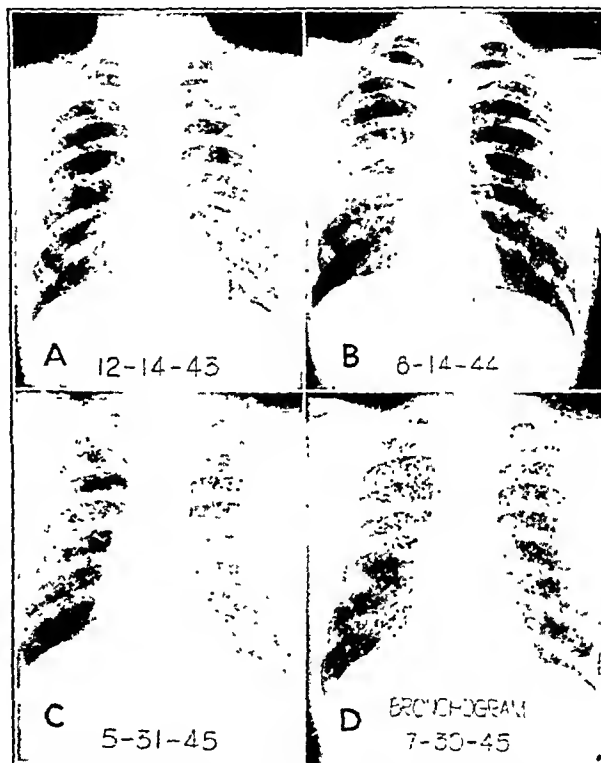

Fig. 3 (case 2).—Changes that occurred after penicillin therapy in a patient aged 45 with acute lung abscesses: A, appearance at time of admission to the Psychiatric Hospital. B, two abscesses in superior division of the right lower lobe before penicillin therapy. C, no evidence of abscesses nine months after penicillin therapy. D, bronchogram showing residual cavity, which was not evident on routine roentgenograms.

pleural thickening. The bases of both lungs appeared to be emphysematous, but no cavity could be seen. On May 31, 1945 roentgenograms of the chest were again taken which showed increased lung markings, no areas of infiltration or consolidation and no evidence of lung abscesses. Although the patient had been without evidence of lung disease for nine months, follow-up roentgenographic examinations including bronchograms were done on July 30, 1945. In the upper posterior part of the right lower lobe a smooth walled 3 cm. cavity was clearly demonstrated (fig. 3). There was no evidence of pneumonitis about the cavity. This cavity was situated in the position occupied by the largest of the two lung abscesses. Its presence had not been suspected in the roentgenograms taken nine and four months before.

Hospital Course.—Intramuscular penicillin therapy was begun on the first hospital day. He received 15,000 units every three

hours throughout the thirty-seven days of hospitalization in the General Hospital. During the month following his transfer back to the Psychiatric Division he continued to receive penicillin by the same route of administration and the same total daily dose. Therefore this patient received a total of about 7,700,000 units of penicillin in a period of sixty-seven days. The volume of the sputum decreased progressively; it was 51 Gm. on the third hospital day, 12 Gm. on the sixth hospital day and 5 Gm. on the eighth hospital day. The temperature and pulse remained within normal limits during the entire course of the illness. However, the respiratory rate was elevated during the first three days after admission, then it returned to and remained normal.

When all physical signs of pulmonary disease disappeared and no cavities were reported on roentgenograms taken one and nine months following the use of penicillin, we considered that the multiple abscesses had been obliterated and healed by fibrosis. To obtain objective evidence regarding this point a roentgenographic examination using iodized poppyseed oil was done ten months following the completion of penicillin therapy. The demonstration of a single residual cavity by the contrast medium had not been anticipated and its presence would not have been shown without the bronchograms. This cavity is probably epithelized and because the patient is asymptomatic we do not plan active therapy at the present time.

We believe that the continuous daily administration of penicillin for sixty-seven days was undoubtedly a factor in controlling the pulmonary infection in this case.

CASE 3.—History.—C. B., a man aged 57, an attendant, was admitted on Feb. 12, 1945 with a history of having experienced stabbing pain in the right upper abdominal quadrant penetrating to the back for about three days prior to admission. The pain had extended to the right side of the chest and was made worse by deep inspiration; it was also made worse by the presence of a productive cough. He had been previously examined at this hospital and was known to have had a posterior myocardial infarct, moderate obesity and hypertension.

Physical Examination.—On admission the temperature was 100.6 F., the pulse rate 100 and the respiratory rate 44 per minute. The patient was well developed but obviously dyspneic and, except for dullness over the right upper chest and fine rales at the bases posteriorly, the physical examination was negative.

Fig. 4 (case 3).—Clinical course following penicillin therapy in a patient with an acute lung abscess due to an embolus from thrombophlebitis of the leg.

Laboratory Data.—The blood count on February 14 was hemoglobin 13.5 Gm., erythrocytes 4.32 million per cubic millimeter and leukocytes 14,250 per cubic millimeter. On February 13 the sputum showed many type XVII pneumococci. No acid fast bacilli were found on five examinations.

Roentgenograms (fig. 4).—On February 14 roentgenograms of the chest showed peribronchial infiltration in both bases and was interpreted as bronchopneumonia. On March 22 there was an area of pneumonitis in the right midlung field, within which there was an area of rarefaction and lateral view of the chest

showed the cavity at the apex of the right lower lobe with a fluid level. On April 18 roentgenograms showed decrease in both the size of the cavity and the pneumonitis. On June 3 roentgenograms of the chest showed the presence of the cavity with minimal reactions about the cavity. Roentgenographic examinations of the chest, including bronchograms taken on July 27, revealed no evidence of a residual cavity in the apex of the right lower lobe.

Hospital Course.—On February 15 sulfadiazine 4 Gm. was given orally as an initial dose and 1 Gm. every four hours for seven days. During this time the patient continued to

Fig. 5 (case 4).—Clinical course of a patient with multiple chronic lung abscesses treated with penicillin.

experience chest pain on the right side and coughed up old blood. On February 24 sulfadiazine was restarted in the aforementioned dosages. Physical examination at that time revealed dullness with crackling rales at the bases. The sulfadiazine was continued for five days. The low-grade fever, chest pain and dark foul sputum persisted. On March 2 the patient experienced additional pain in the right side of the chest associated with pain in the right calf and venous engorgement. The patient was thought to have had a pulmonary infarct and thrombophlebitis. Penicillin in doses of 15,000 units given every three hours intramuscularly was started on March 2 and continued for eleven days. Thus a total of 1,575,000 units of penicillin was given in this initial course. The right femoral vein was ligated on March 7 and at the time of operation a firm clot could be felt within the femoral vein and a 14 inch clot was aspirated from the vein. On March 22 there was roentgenographic evidence of a lung abscess. Penicillin was again started on March 29 in doses of 50,000 units every three hours by the intramuscular route and continued at this high level for fifteen days. Then on April 15 the penicillin was decreased to 15,000 units every three hours and kept at this dose until discontinued on June 9. The total amount of penicillin administered during the second course was 12,600,000 units; the total for the two courses was 14,175,000 units.

We consider that the results in this case, an acute pulmonary abscess due to an embolus, can be attributed to the long continued use of penicillin. We were unable to demonstrate a residual pulmonary cavity by bronchograms. This procedure was indicated in view of our experience in case 2 and was done two months following the discontinuance of penicillin. The total period of observation has been six months since the lung abscess first developed. The patient is now employed as an attendant in this hospital and is without any evidence of pulmonary disease.

CASE 4.—History.—F. K., a white man aged 57, a laborer, was transferred to the Wayne County General Hospital from the Henry Ford Hospital, Detroit, on Jan. 11, 1944. During the first week in December 1943 he had a severe cold with fever, cough, chest pain and night sweats and had lost 20 pounds (9 Kg.). A report from the Henry Ford Hospital¹ stated that when he was first seen there was dullness over the right upper lobe pos-

1. Personal communication from Dr. F. Janney Smith, Detroit.

teriorly with prolonged expiratory breath sounds. Their laboratory studies showed hemoglobin 13.7 Gm., red blood cells 4,210,000 per cubic millimeter, white blood cells 17,500 per cubic millimeter and in the sputum type IV pneumococci but no acid fast bacilli. In that hospital the patient had a septic type of temperature which was not influenced by accepted therapeutic doses of sulfadiazine. Roentgenograms taken there revealed multiple abscesses of the upper lobe of the right lung. On bronchoscopy pus was seen coming from the right upper lobe bronchus, which was moderately obstructed. A biopsy of the wall of the bronchus showed only inflammatory changes.

Physical Examination.—At the time of admission to the Wayne County General Hospital the patient appeared pale and chronically ill. There was dullness over the right upper lobe, with numerous fine inspiratory rales over the same lobe. His weight was 117 pounds (53 Kg.).

Laboratory Data.—Two days after admission the hemoglobin was 9.5 Gm., red blood cell count 3,400,000 per cubic millimeter and white blood cell count 15,800 per cubic millimeter. Six specimens of sputum were studied for tubercle bacilli by smear and culture with negative results. Bronchoscopy revealed no malignant obstruction, and cultures of secretions from the

examinations on Aug. 13, 1945 this patient had been without roentgenographic evidence of active pulmonary disease for ten months. In view of our experience in case 2, in which a "silent" cavity was demonstrated following the instillation of iodized oil, it was decided to include bronchographic studies on this patient. In the central portion of the right middle and upper portion of the right lower lobes multiple bronchiectatic cavities were shown (fig. 6).

Hospital Course and Therapy (fig. 5).—During the first three months in this hospital the patient's temperature was septic in type, ranging from 99 to 102 F. daily. The pulse and respiratory rates were correspondingly elevated. He experienced chills and profuse diaphoresis and expectorated an average of 120 cc. of foul-smelling mucopurulent sputum each day. His weight, which on the first hospital day was 117 pounds (53 Kg.), decreased to 107 pounds (48.5 Kg.) on the 102d hospital day. Sulfamerazine was started on the 16th hospital day in doses of 4 Gm. daily and continued for seventy-two days without any improvement. From the 89th to the 99th hospital day the patient received 1 million units of penicillin given intramuscularly in doses of 20,000 units every four hours. The temperature decreased abruptly to normal on the second day

Fig. 6. (case 4).—Patient aged 57 with multiple chronic lung abscesses: A, large abscesses in the right upper lobe. B, appearance ten months after penicillin therapy, showing residual thickened pleura but no evidence of lung disease. C, bronchogram taken thirteen months after penicillin therapy, showing residual bronchiectatic cavities in the right lung.

right upper lobe obtained through the bronchoscope revealed hemolytic and nonhemolytic streptococci and *Neisseria catarrhalis*.

Roentgenograms.—The course of the disease is well illustrated by the changes in the roentgenograms, which were taken at frequent intervals during the twenty month period of observation. The changes in the serial chest films are reproduced in the series of sketches in the upper part of figure 5. In the first roentgenograms of the lungs, taken January 18, there was a 2 cm. cavity just above the hilus in the right upper lobe. It had a distinct fluid level and was surrounded by an area of consolidation. Eight days later two abscesses were present, which on lateral view were seen to be located in the posterior portion of the chest. The chest film taken on March 16 showed a large abscess in the right upper lobe which apparently had no relationship to the abscesses previously described and the consolidation had extended to involve the right middle lobe area. This cavity showed progressive diminution in size on the films taken at monthly intervals and for the first time was not visualized on the film taken on November 8, which was interpreted as showing only evidence of pleural thickening. The roentgenogram of the chest taken on May 21, 1945 showed some residual thickened pleura but no evidence of lung disease. At the time of the last follow-up

of penicillin therapy, and the volume of the sputum decreased to an average of only 45 cc. per day. The temperature continued normal during the remainder of the time the patient was receiving the first course of penicillin, but it again became septic in type four days after the drug was stopped. Thirty-four days later, on the 134th hospital day, penicillin was again started, the same route and dose schedule being used; on the 153d hospital day the dose was decreased to 10,000 units and given intramuscularly every three hours, and seventeen days later it was further decreased to 5,000 units intramuscularly at three hour intervals until the drug was discontinued on July 25, 1944, which was the 299th hospital day. This patient received a total of 6,360,000 units of penicillin given intramuscularly during a period of seven and one-half months. The volume of the sputum again decreased progressively during the second course of penicillin, being 150 cc. on the 134th hospital day when this series was started, 45 cc. on the 140th hospital day and 15 cc. on the 170th hospital day, and at the time of discharge he was expectorating an average of only 2 cc. each day. The patient's weight gradually increased from 107 pounds (48.5 Kg.) at the time the second course of penicillin was given and reached 116 pounds (52.6 Kg.) on the 134th hospital day, 118 pounds (53.5 Kg.) on the 140th hospital day and 133 pounds (60 Kg.) on the 170th hospital day. At the time of release he

weighed 137 pounds (62 Kg.), which was his usual weight. This patient has been followed in the outpatient department of this hospital and on Nov. 8, 1944 he was asymptomatic and weighed 140 pounds (63.5 Kg.). He was last examined on Aug. 13, 1945, at which time he was still entirely free from symptoms and was working seven days each week at hard labor in a defense factory. His weight at that time was 140 pounds.

This patient had chronic multiple lung abscesses for which he received sulfadiazine and sulfamerazine in the usual therapeutic doses during a thirteen week period without improvement. During the next seven and one-half months he received more than 6 million units of penicillin given by the intramuscular route. With this therapy, which was almost continuous, he showed a gradual progressive clinical improvement. To date he has been observed for a total of twenty months and is now without symptoms and is employed full time at his previous occupation as a factory worker.

We believe that the long-continued use of penicillin in this case controlled the pulmonary infection and thus permitted the gradual healing of the pulmonary abscesses. We believe that without therapy in this case death was very likely and that penicillin should be considered as having been instrumental in the recovery. We attribute the satisfactory response to the long-continued use of penicillin, which controlled the pulmonary infection and thus permitted the gradual healing of the multiple abscesses.

COMMENT

It is obvious that the collective information on the subject of penicillin therapy of lung abscesses is too meager at present to determine the exact place of this new antibiotic in the treatment of these cases. These 4 cases are reported solely to add to the collective statistics that will eventually enable the medical profession to evaluate this new drug.

The total amount of penicillin given to the patients who have been treated in this hospital was greater than that given by others to patients with lung abscesses. The seemingly greater efficacy of penicillin therapy in this small series when the results are compared with the collective series (shown in the table) may be due entirely to chance. Evidently the total dosage is not a significant factor, for the largest total doses previously reported were given to patients who were not cured (fourth case of Dawson and Hobby in the table and third and fourth cases of Barach and his associates in the table).

The duration of continuous intramuscular penicillin therapy employed in the cases which form the basis for this report has been longer than that used in any of the previously reported cases. Patient 1, with an acute lung abscess, was given continuous treatment for thirty-seven days. Patient 2, with acute lung abscesses, was treated for thirty-nine days. Patient 3, who had a pulmonary abscess following an embolus to the lung, was treated continuously for eighty-one days. Patient 4 received daily injections of penicillin for one hundred and sixty-six days without interruption. It would appear that this long-continued chemotherapy is required to control the surrounding infection adequately. Much more detailed clinical work is necessary before the final word can be said about the dosage of penicillin in lung abscesses.

We wish to stress the advisability of obtaining bronchograms in the follow-up study of all patients with lung abscesses treated with penicillin. The importance of

this is clearly shown in our experience in cases 2 and 4. No cavities were reported on the routine roentgenograms of the chest in case 2 taken nine months after all evidence of pulmonary disease had subsided, but the presence of a residual cavity was easily demonstrated following the instillation of iodized oil. In case 4 the existence of bronchiectasis, not suspected on routine roentgenograms, was proved by the same method. It is therefore evident that, before one is justified in concluding that a patient with pulmonary abscesses treated with penicillin is cured, a thorough investigation with some radiopaque medium is indicated.

It is noteworthy that these patients tolerated such massive doses of penicillin without any significant untoward reactions. The patients with acute lung abscesses (1, 2 and 3) received 6,380,000, 7,700,000 and 14,175,000 units of penicillin respectively. The patient who had multiple chronic lung abscesses was given a total of 6,360,000 units of penicillin over seven and one-half months of hospitalization.

Our experience, though limited, has been similar to that reported by others. It seems probable that many acute lung abscesses may be cured by this means. In the chronic cases of lung abscesses in which there is adequate drainage through a bronchus, it would appear that recovery may be expected with the use of penicillin alone if continued sufficiently long. In those cases of chronic lung abscesses which do not communicate with a bronchus to allow free drainage, surgical intervention will probably be required. It is predicted that if lung abscesses are recognized early and treated vigorously with penicillin, it can be reasonably expected that the mortality and morbidity from this disease will further decrease.

SUMMARY

Of a total of 31 previously reported cases of lung abscess treated with penicillin, 13 have shown complete recovery, 8 have shown satisfactory improvement and in 10 there was either no change or death occurred.

Of 4 patients with pulmonary abscesses whom we treated with penicillin administered by the intramuscular route, 3 had acute pulmonary suppuration with cavity formation and the fourth had chronic lung abscesses. All of these patients had mixed infections. The period of follow-up observation of the patient with chronic lung abscesses was twenty months; the patients with the acute abscesses have been studied for five, six and twelve months. There has been complete recovery in 2 of the acute cases. In case 2 there was complete healing of one abscess and resolution of the surrounding pneumonitis, but a residual thin walled cavity still persists. The presence of this cavity was not evident on the routine roentgenograms but was easily demonstrated on the bronchograms. Patient 4, the one with multiple chronic lung abscesses, has shown complete clearing of the original abscess cavities but has many saccular bronchiectatic cavities. The area involved with the residual bronchiectasis is the right middle and lower lobes and is not the site of the previous cavities.

In our experience the long-continued use of penicillin has resulted in the control of the surrounding pneumonitis in all 4 cases and has permitted the healing of the abscess cavities in 3 of them. We are of the opinion that if lung abscesses are recognized early and vigorously treated by long-continued penicillin administration there will be an appreciable reduction in the morbidity and mortality from this disease.

PERIPHERAL NERVE INJURIES IN EUROPEAN THEATER OF OPERATIONS

MANAGEMENT, WITH SPECIAL REFERENCE TO
EARLY NERVE SURGERY

COLONEL R. GLEN SPURLING

Senior Consultant in Neurosurgery, European Theater of Operations
MEDICAL CORPS, ARMY OF THE UNITED STATES

The improper management of peripheral nerve injuries, as is well known, can leave the patient with a useless, anesthetic limb, amputation of which is frequently the lesser evil. The fact that approximately 15 per cent of all battle injuries of the extremities in the European Theater of Operations were complicated by nerve damage therefore made the planning of an efficient program for their management a matter of extreme importance. Like all programs planned in wartime, the regimen finally devised was based on fundamental surgical principles modified, as circumstances required, to bring them into accord with the exigencies of the military situation.

The neurosurgical principles on which the management of peripheral nerve injuries in the European Theater of Operations was based may be briefly stated as follows: 1. In view of the irreparable degenerative changes which occur in the distal segment and the end plates of a severed nerve with the passage of time, early surgical repair is essential for the best results. 2. Immediate primary suture of a severed nerve is desirable theoretically but in practice is not a good plan, if only because battle injuries are almost invariably associated with contusion of nerve tissue. 3. Experimental and histopathologic evidence¹ indicates that the optimum time for end to end suture of a severed nerve is between the third and the ninth week after injury, and that repair between the twenty-first and the twenty-eighth day is probably productive of the best end results and can be carried out with the least technical difficulties.

In military practice the selection and disposition of cases for operation and other phases of treatment are sometimes necessarily modified by factors which may not be related to the professional welfare of the patient. The chief of these difficulties has to do with transportation. In Circular Letter No. 81, dated June 10, 1944, the Office of the Chief Surgeon, European Theater of Operations, issued instructions to all military installations in this theater that neurosurgical casualties² should be transferred to the United Kingdom, for admission to some one of the twelve neurosurgical centers which had been established there, as promptly as transportation facilities permitted. Priorities for evacuation in this category went first to spinal injuries, second to penetrating injuries of the brain, third to closed cranial injuries and last to peripheral nerve injuries.

From the standpoint of risk to life this order of priority was obviously justified. The practical result,

however, was that patients with peripheral nerve injuries, because of their low priority of evacuation, seldom reached the neurosurgical centers in the United Kingdom until two to three weeks after wounding. In the interim, the injuries had been debrided, in conformity with the regulations established for the management of soft tissue wounds, and delayed wound closure had usually been done at some one of the installations at which the patients had been temporarily delayed in transit.

Under these circumstances it would have been desirable to perform most of the definitive peripheral nerve surgery in the zone of the interior (the United States). For one thing, it is imperative in an active theater of operations to keep nonemergency surgery at a minimum, leaving hospital beds free for more urgent requirements. For another, most patients with peripheral nerve injuries are never again fit for combat duty and may be promptly written off as military effectives. On the other hand, experience soon showed that for military reasons evacuation to the zone of the interior was often so long delayed that the optimum period for nerve repair would have passed by the time the patients had reached neurosurgical centers in the United States. In the absence of complications, however—and they are not the rule in properly managed cases—the usual neurosurgical patient could safely be put aboard a hospital carrier within a few days after operation.

The solution of the problem, then, was to correlate the available transportation and the optimum time for neurosurgery in each case, which was done as follows: 1. Disposition board proceedings were completed as soon as possible after the patient was admitted to the hospital from the zone of combat. 2. Patients with serious wound infections or with extensive soft tissue injuries requiring plastic repair were evacuated to the United States as promptly as possible, without being submitted to neurosurgery in the United Kingdom. 3. If transportation was available, all other neurosurgical casualties were prepared for evacuation to the zone of the interior. 4. If it was not, or if for any other reason, including complicating injuries, evacuation was undesirable, the waiting period was utilized for the repair of nerve injuries and the patients were evacuated to the United States as soon after operation as their condition permitted and facilities were available.

One of the serious difficulties in the management of peripheral nerve injuries in the European Theater of Operations had to do with the totally inadequate number of trained neurosurgeons available to handle the casualty load. The deficit was met in two ways, by the use of a number of general surgeons in the theater who had had some training in traumatic surgery in the zone of the interior and by the use of general surgeons of sound training who were rapidly instructed in fundamental neurosurgical principles. These two supplemental groups of surgeons were assigned to special neurosurgical centers, in which they worked under chiefs of service who were formally trained in neurosurgery and who usually had had considerable experience in their specialty in civilian practice. The centers were under the continuous supervision of local and regional consultants in neurosurgery, who in turn maintained intimate contact with the Professional Services Division of the Chief Surgeon's Office, European Theater of Operations. The entire program could thus be unified by standardization of diagnostic and therapeutic methods. It is not too much to say that it was

2. Neurosurgical injuries had previously been defined as including all surgical lesions of the central, peripheral and sympathetic nervous systems, the classification being necessary because the medical departments of some of the other Allied armies included only craniocerebral injuries in this category.

the resourcefulness and energy of the young general surgeons who were suddenly called on to become proficient in neurosurgery which made possible the handling of so many peripheral nerve injuries within the optimum period for repair.

PROGRAM OF MANAGEMENT

The Manual of Therapy for the European Theater of Operations issued May 5, 1944, outlined the following plan of management for peripheral nerve injuries, which, it is interesting to note, required no substantial alterations in the year of heavy fighting which followed:

1. Injury to one or more of the major nerve trunks should be regarded as a possibility in every wound of the extremities. Simple tests for motor and sensory function should be used to determine which nerve (or nerves) is involved.

2. The existence of a nerve injury does not warrant any departure from the regulation management of soft tissue wounds, that is, initial débridement and delayed wound closure.

3. If when débridement is done the severed nerve ends are visualized, they should be approximated whenever possible. If the gap does not permit approximation, the ends should be snugly anchored to surrounding soft tissue. Fine stainless steel or tantalum wire should be used for suture material, both being useful for later roentgenologic demonstration of the location of the injury and the extent of the defect. The purpose of the initial suture or temporary anchoring of the nerve ends is to prevent their retraction, which greatly complicates later end to end suture. Elaborate primary nerve suture should not be attempted.

4. The soft tissue wound should, as usual, be left open, to be closed at an appropriate time in an installation farther to the rear. The muscles or fascia should be approximated loosely over the exposed nerve trunk. A pack should never be placed over an exposed major nerve trunk.

5. Splinting is usually a preliminary requirement for transportation. About half of all nerve injuries are associated with injuries to one or more of the long bones, but even in the absence of bone injuries the extremity should be immobilized in the most favorable position to prevent deformity. This can usually be achieved with bandages, blankets or rolls of clothing; casts and elaborate splints are seldom required for evacuation. Protection of an extremity deprived of sensation is, however, essential.

6. An extremely important phase of preevacuation management is the careful recording of the condition of the injured nerves at the first observation and a statement as to exactly what was done at débridement. The notes can be written either on the emergency medical tag or on the cast. Lack of these data may delay subsequent surgery or result in unnecessary nerve explorations.

Every surgeon who participated in the peripheral nerve injury program was carefully instructed in the generally accepted technical principles of nerve repair. In particular, it was stressed: 1. That the nerve ends must be accurately trimmed until essentially normal tubules were visible. 2. That the divided ends must be approximated with the greatest care by interrupted epineural sutures. 3. That the suture line must be perfectly free from tension. 4. That hemostasis must

be rigid. The use of a through and through suture (sling stitch) was optional.

The suture material recommended for use throughout the European Theater of Operations was fine tantalum wire swedged on an atraumatic needle. A few surgeons, particularly at the beginning of the program, preferred fine silk, but wire was generally used, partly, as already noted, because of its usefulness in later roentgenologic demonstrations of the injury and partly because it is practically inert in human tissues.

A small cuff about the suture line was used in almost all of the cases handled in the European Theater of Operations. Usually it was of rolled tantalum foil, but in one installation a plasnia clot was used according to the technic of Tarlov,³ the variation being permitted for the purpose of obtaining comparative data as to the value of the two methods.

Casts for the correction of deformities due to nerve injuries were prohibited except during the postoperative immobilization period, removable splints being preferred. Extension of the flexed joint was usually begun at the end of the second week after operation and was completed by the end of the fifth week. It was believed that this policy was safe because of the comparative freedom from extensive fibrosis observed in patients treated by early nerve suture, and the plan also reduced the period of overseas hospitalization and permitted evacuation to the zone of the interior within the time policy of the theater.

PHYSICAL THERAPY

It was repeatedly emphasized, by directives, circular letters, conferences and personal visits, to all officers participating in the peripheral nerve injury program that operation was but a single phase of the treatment of an extremity paralyzed as the result of peripheral nerve injury. Obviously an extremity will be functionally useless, however satisfactory the nerve repair and subsequent regeneration may be, if temporarily denervated muscles are permitted to become irreversibly atrophied or fibrosed or if joints of the wrist, hand, ankle, fingers or toes are "frozen" beyond repair. For the best results in neurosurgery it is therefore essential that physical therapy be employed both before and after operation.

The excellent results obtained by the peripheral nerve injury program in the European Theater of Operations were at least in part due to the expansion of the Physical Therapy Service proportionately with the neurosurgical load. The Chief Surgeon's Office cooperated fully in this respect, by the authorization of additional space and equipment, the assignment of available Army personnel in excess of Table of Organization specifications and, whenever possible, the employment of trained British civilian personnel. As a result, the Physical Therapy Service became one of the most important departments of every neurosurgical center.

Recent experiments and clinical studies⁴ have indicated that daily galvanic stimulation of denervated muscles will prevent atrophy and retard fibrosis, and

S.: Studies in Denervation: Effect of Electric Stimulation on Circulation and Recovery of Denervated Muscle, *J. Neurol. & Psychiat.* 6: 136-140 (July & Oct.) 1943.

this measure was therefore employed as a routine in all cases, beginning with fifteen brisk contractions daily and progressing gradually to thirty contractions. When casts were used for postoperative immobilization, windows were cut over the bellies of the paralyzed muscle groups and galvanic stimulation was begun the day after operation. Other measures included massage, active and passive motion and the use of dry and moist heat as indicated. Particularly careful attention was given to the active and passive motion of small joints. Fixation by splints was kept at a minimum, detailed instruction of the patients in respect to the care of their own joints being considered more important than mechanical methods of fixation.

ANALYSIS OF DATA

Earlier in the war, during the fighting in the Mediterranean, many surgeons had been somewhat hesitant over applying the neurosurgical principles just outlined to battle casualties. Even the most skeptical, however, were apparently convinced of their wisdom and safety by the demonstration during the North African campaign that open granulating soft tissue wounds could be closed within seven to ten days after wounding, with resulting primary healing, so that elective neurosurgical

Theater of Operations was less than 1 per cent, whereas in a series of similar cases in which operation was performed in the zone of the interior after the North African campaign it was as high as 10 per cent. The improvement is significant, for elective bone shortening, to facilitate end to end suture, is not a desirable procedure if it can be avoided, while most nerve grafts are clinical failures. I am not aware that a single successful large nerve graft, whether homogenous or autogenous, is on record in the United States Army. Early nerve suture, moreover, was proved to possess at least three major advantages over delayed suture: 1. Mobilization of the proximal and distal nerve segments was much more readily achieved. 2. Fibrosis in the wound, and particularly in the nerve stumps, was greatly minimized. 3. Flexion of contiguous joints was more easily accomplished.

The time lapse between wounding and neurosurgery varied from an average of twenty-eight days in the period immediately after D day to forty-two days in the period of heavy fighting before V-E day. The average of thirty-nine days for the whole period is longer than the most desirable interval, which is twenty-one to twenty-eight days after injury but is still well under the upper limit of ninety days. In some cases

repair could be undertaken within the optimum time period without fear of serious wound infections. The European campaign presented an opportunity to test the program on a large scale.

A few comments on the data contained in the accompanying table may be useful. Of the 6,245 battle casualties hospitalized with major nerve injuries between D day and V-E day, approximately 46 per cent were operated on overseas. The remainder were evacuated to the zone of the interior for definitive surgery for a number of reasons, the most frequent of which was the inability of the neurosurgical centers abroad to handle larger operative loads within the optimum time limit for surgery. The rise in the volume of patients operated on overseas should be noted. The proportion rose from 34 per cent in the three weeks after D day to 50 per cent in the six months before V-E day, in spite of the increasingly heavy patient load.

In almost 47 per cent of the surgical cases the nerve was found intact, and neurolysis, usually external but occasionally internal, was done. In the remaining cases the operation consisted of end to end suture. This is the most desirable method of treating divided nerves, and the fact that it could be applied in almost every case in the series in which it was indicated is evidence of the soundness of the whole program of early nerve suture. The number of insurmountable gaps in the group of cases under consideration from the European

associated injuries and in others delayed closure of the wound accounted for the delay in definitive neurosurgery, but the most frequent reason was the difficulties encountered in evacuation from the continent, particularly during the winter months, when air evacuation was often hampered by bad flying conditions.

On the other hand, the time lapse does not seem unduly long when one recalls that in the interval the patients had been removed from the front line and transferred to various installations along the line of evacuation on the continent before they were finally triaged to special neurosurgical centers in the United Kingdom. On the whole, the thirty-nine day average probably represents the shortest practical period within which definitive neurosurgery can be done on large groups of casualties under conditions of active warfare.

That primary wound healing occurred in more than 98 per cent of the cases is itself convincing testimony as to the wisdom of delaying neurosurgery for three to four weeks after débridement of the initial wound. The policy of early nerve stretching, however, was possibly somewhat overemphasized. A recent follow-up⁵ of a large number of the cases included in this study has revealed 4 per cent of proved disruptions of the suture line, which perhaps can be partially accounted for by this practice. For the present, therefore, no positive statements can be made as to the

5. Woodhall, Barnes: Unpublished data.

optimum time for joint extension, since so many varied factors entered into the analysis.

In many of the simpler cases in the series operations were performed under local (procaine) infiltration analgesia. Operations on the sciatic nerve were usually performed under spinal analgesia. All brachial plexus injuries and many combined injuries of the upper arm were handled under intratracheal ether anesthesia.

The surgical mortality for the whole series was 0.03 per cent. The single death followed local nerve block, in preparation for exploration of a common peroneal nerve lesion, and was presumably the result of a procaine reaction. The fact that nearly three thousand consecutive major neurosurgical operations could have been performed with but one death is ample testimony to the competence of the anesthetists, particularly when it is remembered that neurosurgical procedures are necessarily complicated and prolonged and that as much as five hours may be required for a single operation.

It might be added that at the beginning of the program early nerve surgery was carried out only in the injuries in which bone complications were not present. Later, combined injuries were brought under the same program.⁶ The regimen included débridement and delayed wound closure, balanced skeletal traction for immobilization, chemotherapy, joint operation by the neurosurgeon and orthopedist, and preoperative and postoperative physical therapy.

A Peripheral Nerve Registry has been established in the Professional Consultants Division, Office of the Surgeon General, the purpose of which is to follow up, analyze and assess at regular intervals the results of the program of management outlined in this communication. The preliminary data,⁵ which are now being prepared for publication, fully confirm the soundness of the program adopted.

SUMMARY AND CONCLUSIONS

A routine adopted for the management of peripheral nerve injuries in the European Theater of Operations was based on fundamental surgical principles modified, as circumstances required, to bring them into accord with the exigencies of the military situation.

The essential features of the program were (1) débridement and delayed primary closure of the wound, with approximation or anchoring of the severed nerve ends if they were visualized at the first operation; (2) suture of the divided nerve within twenty-one to ninety days after wounding, but preferably between twenty-one and twenty-eight days, when the least technical difficulties and the best end results can be expected; (3) a judicious use of immobilization during transportation and after neurorrhaphy, preferably by removable splints; (4) preoperative and postoperative physical therapy.

The time at which neurorrhaphy was performed was necessarily influenced by the military circumstances and chiefly by the availability of transportation, but even under active combat conditions definitive surgery, either overseas or in the zone of the interior, was practically always performed well within the upper optimum limit.

In the period between D day and V-E day 2,873 peripheral nerve injuries were treated by early nerve surgery in overseas hospitals, with a mortality of 0.03 per cent and with primary wound healing in 98.3 per cent of all cases.

Clinical Notes, Suggestions and New Instruments

PANTOPAQUE MENINGITIS DISCLOSED AT OPERATION

I. M. TARLOV, M.D., NEW YORK

Although the ideal medium for x-ray visualization of the spinal subarachnoid space has not yet been found, pantopaque appears to be the most satisfactory agent thus far introduced for this purpose. It is more irritating than air or other gases used for myelography, but its use results in much better visualization of the subarachnoid space. It is free from the danger of a radioactive substance such as thorotrast, and it causes less severe reactions than tyrogel.¹ Its advantages over lipiodol are that it flows more freely within the subarachnoid space, fills the arachnoidal prolongations along the nerve roots better, thus being more suitable for the disclosure of herniated intervertebral disks, it is less apt to show false filling defects and it may be more readily removed from the thecal sac. The meningeal response to the injection of pantopaque has been described as "minimal and transient"² and the material is being employed on a widespread scale, sometimes indiscriminately, for the diagnosis and localization of herniated intervertebral disks and other spinal lesions. My purpose in this report is to call attention to a rather pronounced inflammatory response which was found among the nerve roots of the cauda equina at operation sixty hours after 3 cc. of pantopaque had been introduced intrathecally.

REPORT OF CASE

A man aged 37, a salesman, was admitted to the hospital for investigation as to the cause of low back pain which radiated down the posterior aspect of one or the other lower limb, more recently the left. The pain occurred in attacks, each lasting several weeks and coming on about twice a year for the past eleven years. Examination revealed tenderness on firm pressure over the fourth lumbar spine, and hyperextension of the lumbar spine produced considerable low back pain, which radiated posteriorly down the left lower extremity. Neurologic examination revealed no abnormality. X-rays of the lumbosacral spine showed localized hypertrophic arthritis of the bodies of the third and fourth lumbar vertebrae. Lumbar puncture was done in the fourth lumbar interspace and there was no evidence of any block on manometric examination. There were no cells in the spinal fluid, but the globulin was reported as "moderately increased" and the total protein was very slightly elevated (54.8 mg. per hundred cubic centimeters). Three cc. of pantopaque was injected intrathecally. About five hours later the patient complained of generalized headache and stiffness of the neck. His temperature rose to 100.8 F. from an initial level of 98.6 F. On the day after injection the temperature rose to 102 F. and on the following day (of operation) the headache subsided but there was still some nuchal rigidity and the temperature fell to 100 F.

The results of the myelographic examination were inconclusive, but in view of the severity and duration of the pain, together with its refractoriness to conservative medical and orthopedic treatment, an interlaminar exploration of the fourth, fifth and the third lumbar interspaces on the left side was done. There was no evidence of a herniated intervertebral disk, and the spine and lamina of the fourth lumbar vertebra were removed. The dura and arachnoid were opened and considerable whitish, soft, stringy exudate, somewhat adherent to arachnoid and nerve roots of the cauda equina, was seen. No other abnormality was found. The pantopaque was removed from the subarachnoid space.

Some of the material removed at operation was sent to the laboratory for culture, which failed to show any bacterial growth within forty-eight hours. The remainder of the operative specimen was prepared for microscopic study. Examination showed a meshwork of fibrin strands with numerous embedded polymorphonuclear leukocytes, lymphocytes and plasma cells. There were globular spaces within the tissue, which probably contained pantopaque, lost during the process of histologic preparation. The tissue was clearly inflammatory, as shown in the illustration. Since it resembled, at operation, partially organized pus, the patient was given penicillin therapy, which was discontinued on the fifth postoperative day after he had been free from fever and stiff neck for three days. He made an uneventful recovery from his operation and was discharged from the hospital on the twenty-second postoperative day free from discomfort. The postoperative diagnosis was hypertrophic arthritis of the third and fourth lumbar vertebrae and pantopaque meningitis.

Section of histologic preparation of material removed at operation showing inflammatory reaction caused by pantopaque. Hematoxylin and eosin stain, $\times 150$.

COMMENT

Although the inflammatory tissue was removed from the subarachnoid space underlying the fourth lumbar lamina, there is no doubt, in view of the headache, nuchal rigidity and fever that followed the pantopaque injection, that the inflammatory reaction within the subarachnoid space was fairly widespread. The cultures taken from the operative material showed no growth of bacteria, and there is no satisfactory explanation for the inflammatory change other than that it was caused by the presence of pantopaque within the spinal canal. Peacher and Robertson³ made a study of the cerebrospinal fluid findings in a series of 60 patients on whom lumbar punctures were done at varying intervals after pantopaque myelography. They recorded spinal fluid cell counts varying from 685 to 2,150 white blood cells per cubic millimeter in 3 cases. The highest spinal fluid cell count in the remaining cases was 70, the majority of the cases showing no increase of cells or of total protein in the fluid.

3. Peacher, W. S., and Robertson, R. C.: Pantopaque Myelography: Results, Comparison of Contrast Media and Spinal Fluid Reaction, *J. Neurosurgery* 2:220 (May) 1945.

Steinhausen and his co-workers² described a foreign body response to the presence of pantopaque in the subarachnoid space of dogs, and they included in their report the results of examination of a human spinal cord seventeen days after the subarachnoid injection of pantopaque. Few polymorphonuclear leukocytes were observed on the nerve roots. It is quite likely that in the present case reported the inflammatory reaction underwent dissolution, leaving a mere residue of innocuous scar tissue or thickened pia-arachnoid membrane. It is now two months since the operation, and the patient is free from symptoms and abnormal neurologic signs. On the other hand, it is also possible that patients who show a similar type of inflammatory reaction to the drug may develop extensive arachnoiditis such as occurred in a case described by Peacher and Robertson.³ In their case, "subsequent to the removal of a herniated intervertebral disk, bladder retention developed." Operation revealed "an extensive arachnoiditis involving the cauda equina." In their patient "the pantopaque had been completely removed after remaining in the subarachnoid space for about ten to fifteen minutes and it is difficult to presume that the arachnoiditis could have represented a reaction." However, since the symptom of the arachnoiditis followed the introduction of the pantopaque, the burden of proof is with those who disclaim a causal relationship, especially in view of the known meningeal reactions that sometimes follow use of the compound.

One must conclude that there is an element of risk associated with the use of pantopaque, namely the danger of provoking meningeal reactions with possible later neurologic symptoms and signs. Such sequelae, as in the case of other substances introduced into the spinal canal, such as anesthetic agents⁴ or lipiodol,⁵ may come on days or weeks after the injection and progress. Nevertheless there are situations in which myelography is necessary for accurate diagnosis. Until further research discloses a more innocuous contrast medium for myelography, the use of pantopaque seems justified. But its use should be limited strictly to those cases in which the diagnosis cannot be made without the aid of myelography. Furthermore, when pantopaque is used, the injection should be made immediately before fluoroscopy is done rather than hours or days in advance, as is sometimes practiced. Moreover, since Peacher and Robertson found that the meningeal reactions following the subarachnoid injection of pantopaque are more common after incomplete removal of the material, an attempt should be made to remove it completely from the spinal canal immediately at the close of fluoroscopy. This may be done by aspirating the oil from the subarachnoid space under fluoroscopic control or by the technic recently described by Scott and Furlow.⁶ According to their method the "cranial portion of the oil is flowed beneath the tip of the lumbar puncture needle." The stylet is removed from the needle and "the patient is told to take a deep breath and to bear down as if he were attempting to move his bowels. This, of course, is Valsalva's well known experiment of forced expiration against a closed glottis and has the effect of increasing the intraspinal pressure." During this maneuver the column of oil becomes narrowed, moves cranial and "comes bubbling out of the needle." This maneuver "is repeated as often as necessary until all the oil is removed. As a rule this is accomplished within twenty minutes, but occasionally it may take as long as forty minutes. At intervals the patient is examined fluoroscopically and the table is adjusted to keep the diminishing oil column beneath the tip of the needle." The advantage of this method of removing the oil is that the use of suction, which is at times painful and may damage nerve roots, is avoided. However, when this method proves unsuccessful in

removing the oil, one may have to resort to aspiration, which must be carefully done in order to avoid pain and trauma to the cauda equina.

CONCLUSIONS

From the present case reported and from a survey of the literature there is no doubt that an inflammatory and proliferative meningeal reaction may follow the intrathecal introduction of pantopaque. Its use should be restricted therefore to those cases in which critical information is urgently needed for diagnosis and treatment. When employed, it should be injected immediately before fluoroscopy is done and it should be removed immediately after the myelography.

Fifth Avenue at 105th Street.

NEOSTIGMINE METHYLSULFATE AN APPARENT SPECIFIC FOR ARACHNIDISM (BLACK WIDOW SPIDER BITE)

JAMES E. BELL JR., M.D.
Intern, Roper Hospital

AND

JOHN A. BOONE, M.D.
Assistant Professor of Medicine
CHARLESTON, S. C.

Serious results have been observed from the bite of the spider for centuries. Records of these results have been made for over a hundred years, and a popular misconception of their gravity has gained wide acceptance. Carefully observed cases have failed to demonstrate much actual danger to life, but there is no question that the victims undergo severe and prolonged agony.

Latrodectus seems to be the only truly dangerous member of the spider family. Severe epidemics of systemic poisoning were reported in Spain in 1830, 1833 and 1840, and others in France, Italy and Corsica.¹ In the United States, *Latrodectus mactans* is widely distributed, being especially prevalent in the Southern states, the Ohio valley and the western coastal region. It is commonly known as the Black Widow, Shoe Button, Hourglass, T Dot or Po-Ko-Moo spider. It is shiny and coal black and is marked with an hourglass-shaped spot of red or orange on the ventral side of the globose abdomen. It inhabits dimly lighted, secluded places, such as privies, outlying buildings, lumber piles, stumps and the under side of floors and stones.

Bogen¹ reported 150 cases of spider bite, most of them in males, the majority of whom were bitten on the penis or adjacent parts while using outdoor privies. The syndrome of arachnidism which follows the bite has been graphically described by many. At the instant of the bite there is a sharp, stinging sensation which is acutely painful but transient. Fifteen to forty-five minutes later, acute pain appears in nearby regions and spreads centrifugally. It is most severe in the abdomen and legs but also spreads generally to the back, shoulders and arms. The patient is usually restless and cries out in pain. The thighs are usually flexed on the abdomen, the legs are flexed on the thighs, the arms folded on the chest. The systolic blood pressure is usually elevated. Other more variable symptoms are convulsions, paralyzes, urinary retention, shock, delirium, cyanosis, nausea, vomiting, dyspnea, anxiety, insomnia and cold sweats.

The most prominent and almost constant physical finding is a boardlike abdomen which is nontender to palpation. Motion of the extremities is usually limited by spasm of muscle groups. Fever, if present at all, is slight. Acute symptoms last twelve to forty-eight hours, but some cramps usually persist from one to two weeks.

Bogen¹ lists sixty preparations that have been used in treatment. Antitoxins have been developed in the horse and are said to shorten the course if given immediately after the bite.

From the Department of Medicine, Medical College of the State of South Carolina, and the medical service of Roper Hospital.
1. Bogen, Emil: A Study in Spider Poisoning, J. A. M. A. 86: 1894-1896 (June 16) 1926.

Gilbert and Stewart² report almost immediate relief of pain from the intravenous use of calcium gluconate or chloride. Our experience in several cases fails to support the therapeutic effectiveness of calcium salts.

Because cases of spider bite are seen only infrequently in Charleston, S. C., it was felt that the following case, with apparently spectacular relief from neostigmine methylsulfate, should be reported in order that trial by others might more quickly prove its value:

REPORT OF CASE

A Negro youth aged 16, an automobile painter, was admitted to Roper Hospital on Aug. 22, 1945 complaining that he had been bitten on the head of the penis by some insect. At 5 p. m. he sat on the seat of an outdoor privy. A few seconds later he felt a violent, searing pain on the glans penis. He immediately struck himself on the spot and felt some "bug" being brushed off, but he did not see it. The initial pain lasted only two or three minutes.

Approximately twenty minutes later he noted the onset of cramping pains beginning in the groins and extending rapidly to the abdomen. In a matter of minutes the cramps became violent, and agonizing pain was felt over the entire abdomen. He felt his abdomen becoming hard, and relaxation was impossible. One hour after the bite, cramps were present in the back and legs, being especially severe in the legs. There were mild headache and nausea, but no vomiting. Others who shared the privy stated that it contained many spider webs, and that they frequently saw "black and red" spiders.

The patient was well developed and well nourished. Examination one hour after the bite showed the temperature 99.6 F., pulse rate 100, respiratory rate 20 and blood pressure 150 systolic, 106 diastolic. The blood picture was within normal limits; there was no leukocytosis. The urine was normal aside from 2 plus albumin. He was recumbent on the examining table with the thighs flexed on the abdomen, the legs flexed on the thighs, the arms folded on the chest. He was very nervous and tossing about in great pain. Nuchal rigidity was slight and relaxation cogwheel in nature.

The Brudzinski neck sign was negative. The heart was slightly enlarged and rapid with pronounced sinus arrhythmia. A grade 2 blowing apical systolic murmur was heard. Respiration was rapid and almost entirely thoracic. The abdomen was rigid and boardlike but not tender to palpation. The tendon reflexes were active. Sweating was profuse. Muscle spasm was pronounced, particularly in the hamstring group, plantar flexors of the foot and the extensors of the spine. Fine fibrillary twitchings of isolated muscle fibers were present, especially in the pectoral group. An admission diagnosis of arachnidism was made.

When first seen, about one hour after the bite, he was given 10 cc. of 10 per cent calcium gluconate intravenously as recommended by Gilbert and Stewart. There was no abatement of symptoms forty-five minutes later when the injection was repeated. Two hours after the bite the symptoms were more severe, and pronounced periorbital edema was present. He next received an intravenous infusion of 1,000 cc. of 5 per cent glucose in isotonic solution of sodium chloride. Three hours after the bite 5 grains (0.32 Gm.) of pentobarbital sodium was given intramuscularly. Four hours after the bite he received codeine sulfate ½ grain (0.032 Gm.) and acetylsalicylic acid 10 grains (0.6 Gm.) by mouth. Five and one-half hours after the bite he was again given 5 grains of pentobarbital sodium intramuscularly. Six and one-half hours after the bite the patient still showed no sign of having obtained any relief. He remained very restless, cried out in pain and tossed about in bed. The abdomen and other muscle groups remained rigid.

Since good results in the treatment of muscle spasm with neostigmine had been reported in poliomyelitis and rheumatoid arthritis³ and since no relief had followed the recommended

3. Kabat, Herman, and Knapp, M. E.: The Use of Prostigmine in the Treatment of Poliomyelitis, J. A. M. A. 122: 989-995 (Aug. 7) 1943.
The Treatment of Poliomyelitis, Abraham, M.: The Use of Neostigmine in the Treatment of Muscle Spasm in Rheumatoid Arthritis and Associated Conditions: Preliminary Report, ibid. 124: 1237-1239 (April 29) 1944.

therapy, the idea of trying neostigmine occurred to one of us (J. E. Bell). About six and one-half hours after the bite the patient was given 2 cc. of 1:2,000 neostigmine methylsulfate and $\frac{1}{150}$ grain (0.0004 Gm.) of atropine sulfate intramuscularly, the latter to counteract the muscarinic effects of neostigmine.

Fifteen minutes after the neostigmine and atropine the abdomen was becoming softer and a wider range of extremity motion was possible. One hour after the injection the patient was comparatively asymptomatic except for a mild headache, the periorbital edema and slight arthralgia in the right ankle. The initial dose of neostigmine and atropine was repeated at four hour intervals for four doses.

The next morning the patient was asymptomatic except for some residual periorbital edema. His blood pressure at the end of twenty-four hours was 110/74 as compared with 150/106 on admission. A slight frontal headache, always relieved with acetylsalicylic acid, remained for thirty-six hours. After six days' observation he was discharged.

COMMENT

1. In a typical case of arachnidism, the symptoms failed to respond to calcium gluconate and sedatives for a period of five and one-half hours.

2. Dramatic and complete relief of muscle spasm and pain followed within one hour the intramuscular injection of 2 cc. of 1:2,000 neostigmine methylsulfate with $\frac{1}{150}$ grain of atropine sulfate.

3. This single case is presented in the hope that this apparently specific therapy will be tried in other cases without delay.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

The following report has been adopted by the Council for publication.

AUSTIN SMITH, M.D., Secretary.

PREPARATIONS EXEMPT FROM COUNCIL CONSIDERATION

The following official preparations have been declared exempt from Council consideration for inclusion in New and Nonofficial Remedies, as their actions, uses and nature are sufficiently well understood by physicians not to require such inclusion.

This list has been adopted for publication so that it may be brought to the attention of all manufacturers and other interested groups. From time to time there may be added other drugs, the names of which will also be published.

Iron and Ammonium Citrates
Ferrous Sulfate
Calcium Gluconate
Antimeningococcal Serum
Liver and Stomach Preparations included in U. S. P.
Digitalis Preparations included in U. S. P.
Acetylsalicylic Acid
Caffeine with Sodium Benzoate
Carbon Dioxide
Oxygen
Oxygen Carbon Dioxide Mixtures
Chlorinated Paraffin (Chlorococane)
Cinchophen
Necinchophen
Dextrose Solution
Sodium Chloride Solution
Isotonic Solution of Three Chlorides
Sodium Citrate
Sodium Biphosphate
Magnesium Sulfate
Trioxymethylene (Paraformaldehyde U. S. P. N)
Methylene Blue
Quinine and Urea Hydrochloride
Salicylic Acid
Sodium Salicylate
Natural Oil of Sweet Birch (Methyl Salicylate)
Pentobarbital Sodium
Papaverine Hydrochloride
Friture Hydrochloride
Tetraquine
Tribasic Calcium Phosphate
Magnesium Trisilicate
Tribasic Magnesium Phosphate
Icthamol Preparations
Sterphanthin

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

ANTIVENIN (LATRODECTUS MACTANS).—An antitoxic serum prepared by immunizing horses against the venom of the black widow spider (*Latrodectus mactans*).

Actions and Uses.—This material, which is standardized on the basis of its ability to neutralize the venom of the black widow spider when the two are injected simultaneously in mice, is claimed to be indicated in the treatment of patients suffering from symptoms due to bites inflicted by the black widow spider (*Latrodectus mactans*). Prior to use, tests for serum sensitivity should be made, test material consisting of 1:10 dilution of isotonic solution of normal equine serum, which is injected intradermally. If there is a positive skin reaction, an eye test consisting of placing a few drops of the test material on the conjunctiva and watching for ten minutes should be undertaken. If there is a negative result from the skin test, the therapeutic serum can be administered. However, if there is a positive reaction in the eye following the positive skin test, serum therapy should be avoided. If there is a positive skin test and a negative eye test, the individual may be desensitized before administering the serum. The amount of material injected into the skin for the intradermal test should be not more than 0.02 cc. of the test material. The result can be evaluated in ten minutes, a positive reaction consisting of an urticarial wheal surrounded by a zone of erythema.

Associated treatment includes hot plunge baths, intravenous injection of magnesium sulfate, 20 cc. of 10 per cent solution, or intravenous injection of 10 per cent calcium gluconate. Barbiturates may be used for restlessness. Apparently nothing is gained by local treatment at the site of the bite.

Dosage.—An injection of 2.5 cc. of serum is administered intramuscularly.

SHARP & DOHME, INC., PHILADELPHIA

Lyovac Antivenin (*Latrodectus mactans*): 'Vacule' ampul-vial containing a sufficient amount of lyophilized antivenin to yield 2.5 cc. of restored double-concentrated antivenin with phenol 0.35 per cent as a preservative; packaged with a 2.5 cc. ampul of distilled water and one 1 cc. vial of normal horse serum (diluted 1:10) as test and desensitizing material.

A lyophilized antitoxic serum prepared by injecting horses with venom of black widow spiders (*Latrodectus mactans*).

A process of lyophilization consists in the following: The antivenin in specially designed final containers is immersed in a freezing mixture to congeal the substance rapidly with the least molecular rearrangement. The container is then subjected to a high vacuum to accomplish dehydration, which is continued until the residual moisture content is less than 1 per cent, and finally sealed under vacuum.

PYRIDOXINE HYDROCHLORIDE (See New and Nonofficial Remedies, 1944, p. 618).

The following dosage form has been accepted:

ENDO PRODUCTS, INC., RICHMOND HILL, N. Y.

Solution Pyridoxine Hydrochloride: 1 cc. ampuls of 25 mg. and 50 mg. per cc. and 10 cc. vials of 50 mg. per cc.

SULFATHIAZOLE (See New and Nonofficial Remedies, 1945, p. 202).

The following dosage form has been accepted:

VOGEL LABORATORIES, MOHEGAN LAKE, N. Y.

Emulsion Sulfathiazole 5% and 10% Sterilized: 50 cc. and 200 cc. bottles. A 5 per cent or 10 per cent suspension of sulfathiazole in an emulsion of beeswax, liquid petrolatum, triethanolamine and water.

STAPHYLOCOCCUS TOXOID (See New and Nonofficial Remedies, 1945, p. 565).

The following dosage form has been accepted:

AYERST, McKENNA & HARRISON, LTD., NEW YORK

Staphylococcus Toxoid: 3 cc. vials containing in each cubic centimeter the toxoid derived from 20,000 necrotizing doses of toxin. Preserved with 1:20,000 merthiolate.

SATURDAY, DECEMBER 8, 1945

ACUTE NONSPECIFIC MYOCARDITIS

Physicians continue to diagnose myocarditis in the absence of inflammatory disease of the myocardium. The clinical syndrome of cardiac insufficiency is often incorrectly labeled myocarditis.

Acute nonspecific myocarditis is an entity characterized by an acute inflammatory process in the myocardium most often secondary to some acute infectious disease. Saphir,¹ who found myocarditis in 240 of 5,626 necropsies, recommends that many sections be taken from the myocardium, since acute myocarditis may involve only small foci as well as extensive areas of the heart muscle. In those who die of an acute infectious disease the primary process frequently so dominates the pathologic picture that the discovery of myocarditis is only secondary. Cases of sudden death from acute infectious disease have incited both the clinician and the pathologist to a careful examination of the myocardium. Jaffe,² from a careful investigation of 165 cases, concluded that there is a causal relationship between myocarditis and sudden death, myocarditis having proved to be second only to perforated aortic aneurysms as the cause of sudden death. The anatomic picture in all these cases is so uniform both macroscopically and microscopically that morphologic classification is not possible. Classification in relation to the accompanying infection is valuable clinically but is unsatisfactory pathogenically.

Acute nonspecific myocarditis occurs secondary to many diseases of bacterial or virus origin and to some conditions of undetermined origin. The following incomplete list mentions conditions in which acute myocarditis has been demonstrated at necropsy: diphtheria, typhoid, paratyphoid, typhus, dysentery, mumps, pneumonia, scarlet fever, meningococcal infection, gonococcal infection, tularemia, streptococcal and pneumococcal meningitis, pyelitis, bronchiectasis, infectious

mononucleosis and acute suppurative tonsillitis. A special form of myocarditis has been reported in the literature as Fiedler's myocarditis, isolated myocarditis or fibrous myocarditis. It cannot be differentiated from other types of nonspecific myocarditis microscopically. It is classified separately because evidence of a primary disease is not demonstrable at necropsy and a primary disease was not evident clinically. This does not mean that a primary disease did not exist.

The New York Heart Association has set up criteria for the diagnosis of myocarditis.³ The diagnosis can be made correctly more frequently if it is realized that acute myocarditis is not a rare complication of infectious disease. Candel and Wheelock⁴ present a clinical study of 11 cases in which they made a diagnosis of acute nonspecific myocarditis. These cases presented the following common characteristics: (a) Each was associated with an acute infectious disease—peritonsillar abscess (1), pneumonia (2), scarlet fever (1), gonococcal arthritis (3), cystitis (1), infectious mononucleosis (1) and typhus (2). (b) Each had a rapid erythrocytic sedimentation rate even when the primary disease had abated. (c) Each showed significant electrocardiographic alterations. Diagnosis was based on physical signs and symptoms and on electrocardiographic findings. Candel and Wheelock believe that the significance of electrocardiographic abnormalities in the diagnosis of acute nonspecific myocarditis is not fully appreciated.

Evidence has been collected by the internist to show that alterations of the electrocardiogram frequently occur in the course of many acute and occasionally in chronic infectious diseases. Although these changes would be recognized as important in rheumatic disease, they are overlooked when they occur in the course of acute infectious diseases nonrheumatic in origin. In the course of acute rheumatic fever the electrocardiographic changes may return to normal. The clinical interpretation is that the pathologic process responsible for the change has resolved without leaving permanent damage to the myocardium. The same interpretation may be placed on electrocardiographic changes occurring in other acute infectious diseases. Patients whose convalescence from acute infection is slow, with profound asthenia after the acute disease has subsided, should be examined carefully for myocarditis. Slight precordial discomfort, angina pectoris and breathlessness associated with or occurring shortly after an acute infectious disease should also be regarded as indications of myocarditis. Arrhythmias and gallop rhythm should be investigated—a persistently rapid sedimentation rate after the primary infection has subsided should be regarded with suspicion. A correct appraisal of acute

myocarditis is important. Scherf and Boyd⁵ assert that with the frequency of infectious diseases and miscellaneous infections there are but few persons who during a lifetime do not have inflammatory myocardial foci.

THE FUNCTION OF VITAMIN E

Since the definite claim for its existence was made about 1922, vitamin E has assumed several roles in metabolism. The first function associated with this food factor was in connection with reproduction; it prevents the resorption of fetuses in the female and testicular degeneration in the male laboratory rat maintained on a diet composed of purified food substances. Somewhat later a disease called encephalomalacia was produced in chicks restricted to a diet deficient in vitamin E. This condition appears to be associated with impairment of the blood vessels with the resultant cerebral ischemia. By this time vitamin E had been isolated and synthesized; the chemical name of alpha-tocopherol was given to it. Soon it was found that, in line with old observations in rats, paralysis could be reproduced in rabbits and in several other laboratory animals and this experimental muscular dystrophy is now recognized as still another sequel of a lack of vitamin E. Various explanations have been given to account for the foregoing observations; the tocopherols were believed to be natural protectors or antioxidants for other essential substances and to foster the integrity of the capillary walls.

As early as 1936 Martin and Moore¹ called attention to still another phenomenon of vitamin E deficiency: in rats so prepared there occurred a yellowish brown coloration of the uterus due to the collection of a pigment in the muscle of this organ. Skeletal muscle is similarly affected and here the pigmentation is associated with dystrophy.² Mason and Emmel³ have recently described the situation and the progression of the condition in considerable detail. The ovarian pigment seems to be an abnormal product of metabolism formed during cell degeneration in atretic follicles and in regressing corpora lutea. It is phagocytized by the tissue macrophages, giving rise to the abnormal coloration of the tissue. Some of the macrophages escape to the lymph nodes, spleen and liver, where the abnormal pigment is also found. The pigment, resistant to strong acids and alkalis, fat solvents and oxidizing agents, does not contain iron and has not been identified with any known biologic pigment. A determination of the chemical nature of this substance might lead to an understanding of the cellular enzyme system in which vitamin E plays an important part. Although admin-

istration of large doses of tocopherol does not cause the pigment to disappear from the ovary, the function of this organ does not appear to be disturbed by the accumulation of the pigment.

Another relationship between vitamin E and tissue pigment has been reported by Granados and Dam.⁴ In rats restricted to a ration deficient in alpha-tocopherol but containing fat, there is a progressive loss of pigment from the incisors beginning at the gingival margin. This alteration is attributed to the action of the more highly unsaturated fatty acids on the ameloblasts in the absence of vitamin E.⁵ Since tocopherol phosphate brings about a cessation of the greatly increased uptake of oxygen by muscle from an animal lacking vitamin E in the diet,⁶ a further study of the abnormal pigmentation and depigmentation described may lead to the implication of the tocopherols in some phase of the biologic oxidative systems in the body.

TROPICAL DISEASES IN THE UNITED STATES

Some diseases supposed to be peculiar to the tropics occur in parts of the United States. Once a disease is detected in an apparently new environment, it is apt to be encountered more frequently thereafter.

Few physicians were at one time aware of the prevalence of pellagra in the United States. In the early nineteen hundreds Babcock, at that time medical superintendent of the South Carolina State Hospital for the Insane, while visiting in Italy, familiarized himself with the clinical aspects of pellagra. He was convinced that the disease prevailed in the insane hospital population group of his native state, and he verified this impression. His observations attracted the attention of other psychiatrists concerned with the institutional care of the insane; eventually pellagra, especially in the Southern states, became widely recognized.

In 1909 the Rockefeller Commission, headed by Stiles, made a county by county survey of a number of Southern states and discovered the presence of uncinariasis in a large percentage of the native poor. In 1920 Symmers and Frost¹ first described granuloma inguinale in 2 native born American Negroes in Bellevue hospital, neither of whom had ever been outside the United States. Within a few years the disease had been recognized in practically every state in the Union. Much the same statement applies to lymphogranuloma venereum, which was once regarded as strictly a tropical malady whereas it is now known to be common in the United States, especially among the colored population.

Parsons and Zarafonitis² have recently pointed out that "histoplasmosis for many years was believed to be a rare tropical disease" but that "during the past decade the disease has been found widespread in the United States. . . ." They recorded 9 cases originating in Michigan between November 1938 and December 1940. The disease has also been observed in Minnesota, California, Iowa, Tennessee, Ohio, Missouri, Mississippi, Maryland, Virginia, Kentucky, Florida, Indiana, Alabama, Texas, Illinois, Washington, D. C., Oklahoma, Louisiana, New York and North Carolina. In view of the fact that histoplasmosis may be easily overlooked or misinterpreted, it is within the range of probability that it is even commoner than at present suspected.

Only 9 cases of chromomycosis have thus far been recorded in this country. In nearby Cuba, on the other hand, Pardo Castello encountered 20 histologically proved cases in a period of two and one-half years and the disease is correspondingly common in Brazil and Puerto Rico. Many American dermatologists believe that it occurs more frequently in this country than published reports indicate and that it is often overlooked.

Among other tropical diseases to be reckoned with in the United States are typhus, schistosomiasis, cutaneous and visceral leishmaniasis, pinta, onchocerciasis, ancylostomiasis, maduromycosis, yaws and some of the numerous helminthiasis. These and probably others will be imported in greater or less numbers not only by returning military personnel but as a result of augmented travel by air. Of those just named, pinta and onchocerciasis are endemic in Mexico and Central America to the extent of many thousands of cases and are thus perilously close to the Texas border, while the others are none too far removed. Onchocerciasis, which is transmitted by a species of fly that infests some of the Western states, is said to display a distinct tendency to migrate northward (Johnstone and Larsen).

Tropical diseases threaten the health of the people of the United States sufficiently to warrant systematic efforts to identify and control them. American schools of medicine should provide adequate and required instruction in tropical diseases. In various seaports laboratories for the routine diagnosis and scientific investigation of these diseases, such as has been recently inaugurated by the Department of Health of the City of New York, should be established. Among other cities, Charleston, San Francisco, Baltimore and New Orleans would be admirable sites for the location of such laboratories, since, among other advantages, each of these cities could provide collaboration with existing medical schools. Doubtless also steamship companies and air lines that are engaged in the tropical trade would embrace the opportunity to participate in programs of this sort. The United Fruit Company for many years has given commendable attention to the problems in question.

Current Comment

EPIDEMIC DISEASES IN EUROPE

At the time of the collapse of Germany, typhus was widespread; more than 16,000 cases have been reported in the Shaeff area since the occupation.¹ The disease has now been practically eradicated from Germany, however, with only 6 cases recorded in the first week of August. Smallpox is now disappearing from the Iberian peninsula, where it was prevalent until recently. Plague has been potentially dangerous along the Mediterranean since the Suez Canal zone and several South American and Palestine ports became infected. The disease has appeared in Corsica, in Malta and in Taranto in southern Italy. In the latter there were 23 cases, of which 11 were fatal between September 3 and September 24. Typhoid has been unusually prevalent in Berlin since June, when 111 cases were reported. It has since reached epidemic proportions, with 382 cases in July, 1,100 in August and 1,708 during the last two weeks of September. Other areas in Germany and in Denmark have also had a high incidence of typhoid. The information regarding diphtheria is scanty, although during the last two years of the war it was the leading epidemic disease in portions of north and central Europe. In France nearly 4,000 cases were reported in June 1945. Although the information is still quite incomplete, several of these diseases are believed to be extensive in the Balkans. For example, there were still around 1,000 cases of typhus in Bosnia alone. Serious epidemics of typhoid have occurred in Albania. Stowman believes that with well planned collaboration and adequate supplies and qualified personnel it should be possible to stamp out typhus in the eastern half of Europe as has been done in the western half. Typhoid and dysentery will be harder to control under present conditions.

INFLUENZA VIRUS VACCINE

Extensive laboratory studies have been made with influenza virus vaccine by many qualified workers, and actual prophylactic trials have been observed as far as the prevailing outbreaks of influenza permit. Safety has been established and prophylactic value demonstrated within the limits of the type of infection existing at the time of making the field trial. Adequate immunity did not develop in each person treated, but the difference in the occurrence of influenza in the treated and control groups was statistically significant. How long this acquired immunity will remain with the treated person under normal living conditions can be proved only by the test of time. A number of other problems related to the antigenic coverage of the vaccine remain to be solved. Acting on the evidence at hand and with the full knowledge that this was not the complete solution, the Commission on Influenza recommended that a reserve stock of vaccine be acquired for use by the Army, if the need occurred. It was recognized that the needs of war could not wait the orderly solution of the problems still remaining. The Public Health

1. Stowman, Knud: Epidemic Situation in Europe, Epidemiological Inform. Bull. 1:719 (Oct. 15) 1945.

Service concurred in this decision and through the National Institute of Health agreed to set up minimum requirements to guide the producing laboratories in the production of the vaccine and otherwise to control the product in the same manner as is done with licensed products. Because the biologics law does not lend itself to emergency interpretation, and because there remained problems of production, distribution and immunity studies which needed clarification, it was decided that influenza virus vaccine should not be recommended for license for civilian distribution at that time. In the interim the Public Health Service, through the National Institute of Health, has followed research and production developments. When the evidence became adequate to meet the minimum requirements of the biologics law and production problems had been solved, it was decided to give favorable consideration to recommending the vaccine for license if a qualified manufacturer should apply. A memorandum to this effect has been sent to producing laboratories and others directly concerned. This has been done even though it is realized that many questions still must be solved before the full range of protection afforded by this vaccine is known. In the meantime the evidence indicates that a reasonable degree of protection is developed against the type of influenza prevailing during these war years.

EFFECT OF GLUTAMIC ACID ON PETIT MAL TYPES OF EPILEPSY

The observation that grand mal attacks of epilepsy are in the majority of the cases more or less completely controlled by anticonvulsant therapy, whereas petit mal types of attack not infrequently are not influenced by medication, suggests that the trigger mechanism in the two types may not be identical. The petit mal seizures respond favorably to fasting and to a ketogenic diet. The difficulties, however, in maintaining a dietary regimen that will produce ketonuria led to a search for acidosis-producing drugs. From theoretical considerations, Waelisch thought that *dl*-glutamic acid or *l*-glutamic acid should be capable of producing acidosis. Furthermore, *l*-glutamic acid is known to be metabolized by slices of brain tissue. Price and his associates¹ found that 4 Gm. of *dl*-glutamic acid administered three times daily was sufficient to maintain the p_H of the urine at about 5.0. Administration of this amino acid together with the usual anticonvulsant therapy (diphenylhydantoin-phenobarbital combination) was effective in decreasing the frequency of petit mal seizures in their patients. There was also a pronounced mental and physical alertness. Grand mal attacks were not affected by the drug. Spangler² administered glutamic acid to 6 patients subject to both grand mal and petit mal seizures and selected because their petit mal attacks were not influenced by the anticonvulsant drug therapy.

1. Price, J. C.; Waelisch, H., and Putnam, T. J.: *dl*-Glutamic Acid Hydrochloride in Treatment of Petit Mal and Psychomotor Seizures, *J. A. M. A.* 122: 1153 (Aug. 21) 1943.

2. Spangler, R. H.: Effect of Glutamic Acid on the Hydrogen Ion Concentration (p_H) of the Urine in Petit Mal Types of Epilepsy, *Ann. Allergy* 3: 241 (July Aug.) 1945.

When glutamic acid was added to the crotalin-diphenylhydantoin-phenobarbital therapy the petit mal seizures were reduced in frequency and modified in character and severity. The effect was practically the same in all 6 patients. The amount of acid administered was guided by a daily recording of the urinary p_H in an effort to keep the hydrogen ion concentration below 5.0. The p_H of one of these patients was recorded daily for one year. The beneficial effect of glutamic acid in lowering the p_H of the urine in epilepsy, as illustrated in this case, and the fact that menstruation, even when the patient is taking glutamic acid, often causes an increase in the petit mal seizures, suggests that endocrine function may be less of a factor in the etiology of petit mal than the increase in the hydrogen ion concentration of the urine during menstruation. It is possible, Spangler believes, that petit mal seizures may result more from an altered immunologic allergic response, as shown by a decreased hydrogen ion concentration in the urine.

ACCIDENTAL SUFFOCATION OF INFANTS

Davison¹ calls attention to the fact that statistics relating to infant suffocation are misleading in that they err on the side of overestimation. During the years 1938 to 1944, 318 deaths considered as possibly due to asphyxia were reported to the coroner in Birmingham, England. Of these infants only 38 were shown to have died of asphyxia. Eighteen died from mechanical suffocation while in bed with parents or some other person, and 6 died from mechanical suffocation while sleeping alone. The remaining 280 deaths were due to natural causes, principally bronchopneumonia, often associated with otitis media. Davison stresses that a postmortem examination is indispensable as part of the routine investigation in every case in which suffocation is considered a likely cause of death. Since this procedure was adopted in Birmingham in 1929 there has been a pronounced fall in the number of deaths of infants due to suffocation.

CONTINUATION COURSES FOR VETERAN AND CIVILIAN PHYSICIANS

Elsewhere in this issue is the semiannual listing of postgraduate continuation courses for veteran and civilian physicians prepared by the Council on Medical Education and Hospitals of the American Medical Association. These courses are offered during the period Jan. 1 to July 16, 1946. The listing is about 30 per cent longer than that for the preceding period, as a result of increased facilities, which have been developed primarily for returning medical officers. More important than mere numbers of courses is the fact that more of the courses are of longer duration, more are being offered by universities and medical schools and there is a wider geographic distribution. This expansion and improvement of offerings will greatly benefit the large number of officers seeking such work.

MEDICINE AND THE WAR

ARMY

NEW RELEASE CRITERIA FOR ARMY MEDICAL DEPARTMENT DEMOBILIZATION

The Secretary of War has announced the following criteria for the separation of nonregular Army Medical Department officers effective December 1:

A. Medical and Dental Corps Officers

Medical and Dental Corps officers are eligible for release from active duty if they meet or exceed any of the following criteria:

(1) Their adjusted service rating is 70 or they have performed forty-two months' active service.

(2) They are 48 years of age, to the nearest birthday.

(3) Exceptions to (1) are officers with primary or secondary classifications a, b or c in the following military occupational specialty categories:

a. Officers in this group will be separated with adjusted service rating of 70 or length of service forty-five months:

3105 Gastroenterology	3130 Neuropsychiatry
3107 Cardiology	3150 General surgery
3111 Urology	3306 Radiology
3112 Dermatology	3325 Pathology
3115 Anesthesia	3180 Physical therapy

b. Officers in this group will be separated with adjusted service rating score of 80 or length of service prior to Dec. 7, 1941:

3106 Ophthalmology-oto-rhinolaryngology	3139 Internal medicine
3125 Ophthalmology	3152 Plastic surgery
3126 Otorhinolaryngology	3153 Orthopedic surgery

B. Veterinary Corps Officers

Veterinary Corps officers are eligible for release from active military duty if their adjusted service rating is 70 or if they are 42 years of age to the nearest birthday or if they have performed forty-two months' active service.

C. Sanitary Corps Officers

Sanitary Corps officers are eligible for release from active military duty if their adjusted service rating is 60 or if they are 42 years of age to the nearest birthday or if they have performed forty-two months of active service.

D. Medical Administrative Corps Officers

Medical Administrative Corps officers are eligible for release from active military duty if their adjusted service rating is 60 or if they are 42 years of age or if they have performed forty-two months' active service.

E. Army Nurse Corps Officers and Physical Therapists

(1) Army Nurse Corps officers and physical therapists are eligible for release from active military duty if their adjusted service rating is 25 or if they are 30 years of age to the nearest birthday or if they have performed twenty-four months of service.

(2) Army Nurse Corps officers and physical therapists with dependent children under 14 years of age are eligible for release from active military duty.

(3) Army Nurse Corps officers and physical therapists who are married are eligible for release.

(4) Army Nurse Corps officers and physical therapists whose physical status is LUS (limited United States Service) are eligible for release.

F. Medical Department Dietitians

(1) Medical Department dietitians are eligible for release from active military duty if their adjusted service rating is 30 or if they are 35 years of age to the nearest birthday.

(2) Medical Department dietitians with dependent children under 14 years of age are eligible for release from active military duty.

(3) Medical Department dietitians who are married are eligible for release.

(4) Medical Department dietitians whose physical status is LUS (limited United States service) are eligible for release.

Definitions and Procedure

The following definitions apply:

A. Length of service as used herein includes total active commissioned and enlisted service, continuous or otherwise, since Sept. 16, 1940 and continues to accrue with the passage of time.

B. Adjusted service rating score as used herein is the score computed for each individual as of Sept. 2, 1945.

Officers who become eligible under this policy will be reported available for separation within ninety days of date of eligibility unless they have volunteered to remain in the service for any additional period of time under existing regulations or instructions. It is desired that maximum care be exercised to avoid the retention of any officer whose services are not absolutely essential to perform the assigned mission. There will be no consideration of military necessity except for those individuals retained under the provisions of section VII of War Department Circular 321, Oct. 20, 1945.

Requests for replacements will be submitted through normal channels through the Office of the Surgeon General.

Officers who are eligible for release in accordance with the foregoing criteria will be ordered to an appropriate separation center or point for processing.

Authority for separation accomplished in accordance with the Medical Department criteria will be Readjustment Regulations 1-5.

Publicity release of the criteria for Dec. 1, 1945 as listed above will be made only, repeat only, by the War Department.

DISTINGUISHED SERVICE MEDAL TO GENERAL DRAPER

Major Gen. Warren F. Draper, Assistant Surgeon General, United States Public Health Service, was recently awarded the Distinguished Service Medal. General Draper "served with conspicuous distinction as chief of the Public Health Branch, G-5 Division, Supreme Headquarters, Allied Expeditionary Force, from May 1944 to June 1945. He directed the formulation and execution of the Supreme Commander's policies governing public health in liberated nations and conquered territories.

Drawing on his many years' experience, he coordinated all resources for the prevention and control of civilian epidemics which might have interfered with military operations and successfully met tremendous problems caused by the chaotic conditions left by the war in many areas. The plans and procedures drawn up by General Draper were successful in every test. Through controlling disease in Europe, he contributed in the highest degree to the success of the Allied forces." General Draper graduated from Harvard Medical School, Boston, in 1910 and entered the service July 12, 1910.

HOLDS CONFERENCES

Medical officers of the Sixth Service Command held a conference at the John B. Murphy Memorial Auditorium of the American College of Surgeons, Chicago, November 9. Numerous papers were presented and discussed concerning technical matters affecting the profession.

A Neuropsychiatric Conference was also held under the auspices of the Sixth Service Command at the John B. Murphy

Memorial Auditorium on November 16-17. Many papers were presented on neurology, psychiatry and ancillary activities, which were open for discussion by Navy and civilian groups.

Civilian physicians were invited to attend these conferences. Both conferences were opened by Col. Don G. Hilldrup, surgeon, Sixth Service Command.

74th MEDICAL BASE DEPOT COMPANY AWARDED PLAQUE

The 74th Medical Base Depot Company was recently awarded the Meritorious Service Unit Plaque "for superior performance of duty in the accomplishment of exceptionally difficult tasks in Mindanao and the Philippine Islands." Commending the company for its immediate construction of a medical supply base and, in spite of daily heavy rains, its efficient organization and distribution of supplies, the citation concluded "wholeheartedly cooperative in spirit, united in maintaining a cheerful and enthusiastic attitude at all times, the 74th Medical Base Depot Company established an outstanding record and contributed materially to the continued success of our forces in the Southwest Pacific Area."

ARMY AWARDS AND COMMENDATIONS

Colonel John C. Fitzpatrick

The Legion of Merit was recently awarded to Col. John C. Fitzpatrick, formerly of Washington, D. C., who, the citation read, "as medical liaison officer to the chief of transportation from June 1943 to March 1945 was charged with formulating plans and developing procedures for evacuating by ship the sick and wounded from all theaters of operation to the United States. He studied current and future requirements of each theater and devised a system to meet these transportation needs on schedule. To effect proper distribution of patients on their arrival in this country, he inaugurated a system of code reporting whereby the place of residence or state of choice and the military and medical classification of all patients could be determined in advance of arrival. He solved many complex problems incident to obtaining, equipping and manning hospital ships, to furnishing adequate medical facilities for troop transports, to establishing debarkation hospitals and hospital wards and to securing kitchen cars. Owing in substantial part to his foresight and determination, several large ships were devoted almost exclusively to evacuating patients on return trips. Through his zeal for the care and comfort of the sick and wounded en route to this country, he contributed materially to maintaining their morale at a high level." Dr. Fitzpatrick graduated from Northwestern University Medical School, Chicago, in 1935 and entered the service July 1, 1936.

Lieutenant Colonel Wilmot C. Townsend

Lieut. Col. Wilmot C. Townsend, formerly of Hartford, Conn., was recently awarded the Bronze Star for meritorious service while directing the medical activities of the 81st Station Hospital. The hospital also received a meritorious service plaque for excellent work in returning 83 per cent of its patients to active duty. The especially appreciative citation accompanying the award stated that "in connection with military operations in the Mediterranean Theater of Operations from July 12, 1943 to May 8, 1945, as chief of the medical service, 81st Station Hospital, during this period, Lieutenant Colonel Townsend was responsible for the care of 7,643 patients, 83 per cent of whom were returned to duty. Because of his outstanding professional ability, his attention to duty and his personal attributes, he was a source of inspiration to his patients and his co-workers. In addition, Lieutenant Colonel Townsend was a gifted teacher, and the personal interest he displayed in the development of his junior staff members was in a great degree responsible for the superior standards of medical service throughout his unit, thereby reflecting great credit on himself and the medical corps of the Army of the United States." Dr. Townsend graduated from Harvard Medical School, Boston, in 1925 and entered the service Sept. 10, 1942.

Major Richard F. Richie

The Bronze Star was recently awarded to Major Richard F. Richie, formerly of Raleigh, N. C., for meritorious service in military operations against the enemy from Dec. 13, 1944 to May 8, 1945 in the United Kingdom, France, Belgium and Germany. The citation stated that "Major Richie as division neuropsychiatrist organized a psychologic leadership school for junior officers in the division that contributed materially in decreasing the number of psychiatric casualties incurred during combat. Through his judgment, ability and initiative many cases of exhaustion that otherwise would have been evacuated from the front were returned to duty." Dr. Richie graduated from the University of Buffalo School of Medicine in 1927 and entered the service July 11, 1942.

Lieutenant Colonel Leonard J. Hospodarsky

Lieut. Col. Leonard J. Hospodarsky, formerly of Ridgeway, Iowa, was recently awarded the Bronze Star for meritorious service in connection with military operations from January 1944 to May 1945 with the IX Engineer Command in the European theater. The citation accompanying the award states that "Lieutenant Colonel Hospodarsky's efforts produced eloquent evidence in the form of complete absence of communicable disease epidemics on the continent, the low hospital rate and the excellent general physical condition of the personnel of the command." Dr. Hospodarsky graduated from State University of Iowa College of Medicine, Iowa City, in 1931 and entered the service Aug. 18, 1941.

Major E. H. Truex Jr.

Major E. H. Truex Jr., formerly of East Hartford, Conn., was recently awarded a citation on behalf of the aural rehabilitation section of the Army's Deshon General Hospital. The citation, which was presented to Major Truex as chief of the section, was from headquarters of the Third Service Command in Baltimore for "excellent quality of work with a minimum amount of lost time and the economical use of personnel, materials and equipment" and was signed by Brig. Gen. T. B. Catron. Major Truex heads the rehabilitation for the hard of hearing and deafened section at Deshon General Hospital. He graduated from Harvard Medical School, Boston, in 1936 and entered the service Sept. 10, 1942.

Lieutenant Colonel Fred P. Long

Lieut. Col. Fred P. Long, formerly of North Platte, Neb., was recently awarded the Bronze Star for meritorious service and noteworthy performance of duty as malariologist at Guadalcanal. The citation commended his wide knowledge of insect control; and his efficient utilization of the troops and the materials at his disposal were reflected in the remarkable reduction in the incidence of malaria and other insect borne diseases. Dr. Long graduated from the University of Tennessee College of Medicine, Memphis, in 1930 and entered the service Oct. 27, 1941.

Major Early B. Lokey Jr.

The Bronze Star was recently awarded to Major Early B. Lokey Jr., formerly of Hattiesburg, Miss., for meritorious achievement on Leyte and Okinawa. He participated in both campaigns as regimental surgeon with the 382d Infantry. Dr. Lokey graduated from Tulane University of Louisiana School of Medicine, New Orleans, in 1941 and entered the service July 1, 1942.

Lieutenant Colonel Timothy Mullen

Lieut. Col. Timothy Mullen, formerly of Seneca, Ill., was recently awarded the Bronze Star for meritorious service in support of military operations against the enemy in northern Luzon and the Philippines from Feb. 15, 1945 to May 10, 1945. Dr. Mullen graduated from the University of Illinois College of Medicine, Chicago, in 1927 and entered the service March 5, 1941.

Captain Elwood O. Horne

Capt. Elwood O. Horne, formerly of Shrewsbury, Mass., was recently awarded the Bronze Star, the Purple Heart and the Silver Star. Dr. Horne graduated from Tufts College Medical School, Boston, in 1936 and entered the service May 21, 1943.

VETERANS

VETERANS REHABILITATION CLINIC OF THE PRESBYTERIAN HOSPITAL

A rehabilitation clinic for veterans was opened at the Columbia-Presbyterian Medical Center, New York, to be known as the Veterans Rehabilitation Clinic of the Presbyterian Hospital. The clinic held its first session November 7 and has held weekly sessions since that time.

All services will be offered to veterans free of charge. The clinic plans to treat those types of neuropsychiatric problems in which a relatively short term psychotherapeutic approach can reasonably be expected to be of decided benefit to the patient. Cases will be referred to the clinic by various government and community agencies dealing with the veteran, and in addition it is anticipated that some veterans will refer themselves directly to the clinic.

The clinic is staffed by twelve neuropsychiatrists, but as the need arises this number will be increased. Consultations will be available with members of the medical staff in an effort to treat organic as well as functional diseases. All of the laboratory facilities of the medical center will be available for these patients. Clinical psychologists will carry out various personality and aptitude studies. Occupational therapy will be

directed by a therapist specially trained in rehabilitation work. Since the ultimate goal of the clinic is to help the veteran to become an active functioning member of the community once more, a committee of laymen is being formed to cooperate with the clinic in problems of employment. This committee will be made up of representatives of various types of industry and business and will work in close cooperation with the clinic.

VETERANS' ADMINISTRATION PLANS FOR WAR AMPUTEES

Services for war amputees, a subject which has come to national attention since the House Subcommittee on Aid to the Physically Handicapped disclosed the inadequate facilities currently available, was reviewed before the subcommittee again on November 20, when Major Gen. Paul R. Hawley, former chief surgeon in the European Theater of Operations and now acting surgeon general of the Veterans Administration, appeared as a witness. General Hawley presented the plans of the Veterans Administration for improving services to the boys who lost limbs in battle.

NAVY

NAVY REDUCES VISION STANDARDS

Under new standards approved by the Secretary of the Navy, Naval Academy candidates with a slight degree of myopia may be considered for acceptance if they still have 20/20 vision in each eye. Minimum vision required of line candidates for commission in the regular Navy is now 15/20 in each eye correctable to 20/20; for staff corps candidates and officers assigned to engineering duty only and to other specialized duty, 8/20 in each eye correctable to 20/20. Previously, requirements for commission in the line were 18/20 in each eye correctable to 20/20, and for staff corps officers 12/20 in each eye correctable to 20/20. Any degree of myopia or myopic astigmatism formerly disqualified a candidate for the Naval Academy. New standards were decided on after careful study and with particular consideration for the excellent record of accomplishment during the war by officers and enlisted personnel who had a moderate degree of visual refractive error.

CAPT. WINCHELL MCKENDREE CRAIG NOMINATED REAR ADMIRAL

Capt. Winchell McKendree Craig, veteran of two wars and chief of surgery at the naval hospital in Bethesda, Md., was recently nominated to the rank of rear admiral, the first time in the history of the Navy that a medical corps reserve officer has been nominated to that rank. In World War I Captain Craig served in the Army as acting war medical officer at the base hospital, Fort George G. Meade. He entered the Navy after Pearl Harbor as a commander and in 1943 was awarded the Medical Reserve Medal with bronze star for twenty years as a medical reserve officer. Dr. Craig is the inventor of the Craig headrest, a device which has proved invaluable in speeding up brain surgery in World War II. He graduated from Johns Hopkins University School of Medicine, Baltimore, in 1919.

NAVY AWARDS AND COMMENDATIONS

Captain Charles W. Shilling

A Letter of Commendation was recently presented to Capt. Charles W. Shilling, formerly of New London, Conn. The citation accompanying the award read "For outstanding achievement in the line of duty as submarine medical examiner and officer in charge of the medical research department from September 1938 to August 1945. Captain Shilling, by his diligence and foresight in planning and his outstanding ability in the scientific research field, developed a program that greatly aided

submarine warfare. In establishing and maintaining liaison between governmental agencies, civilian educational and scientific groups, foreign research groups and the United States Army Research Group, Captain Shilling by untiring zeal and ability has been able to secure results of the highest value to the Navy. Captain Shilling's successful accomplishment in the research and scientific field reflects great credit on himself and the United States Naval Service." Dr. Shilling graduated from the University of Michigan Medical School, Ann Arbor, in 1927 and entered the service July 28, 1927.

Lieutenant Richard Lawrence Merkel

The Air Medal was recently awarded to Lieut. Richard Lawrence Merkel, formerly of Freeport, Ill., "for meritorious achievement in aerial flight as flight surgeon, Air Group 32, attached to the U. S. S. *Langley*, during operations in the enemy Japanese held Marshall, Caroline and Philippine Islands areas, from Jan. 29 to Sept. 23, 1944. Participating in numerous strikes and flights during this period, Lieutenant Merkel rendered gallant service and by his professional skill and courageous devotion to duty in the face of grave hazards contributed essentially to the maintenance of high morale in his air group and to the successful fulfillment of these vital missions. His and to the successful fulfillment of these vital missions. His exemplary conduct and fearless disregard for his own personal safety reflect the highest credit on Lieutenant Merkel and the United States Naval Service." Dr. Merkel graduated from Loyola University School of Medicine, Chicago, in 1942 and entered the service Dec. 22, 1942.

Commander W. Stuart Henderson

Comdr. W. Stuart Henderson, formerly of Akron, Ohio, was recently awarded the Navy's commendation ribbon for "high professional skill and initiative" in treating the wounded aboard Gen. Douglas MacArthur's command ship, the U. S. S. *Nashville*, which lost 133 men killed and 190 wounded through the attack of a Jap suicide plane. Dr. Henderson graduated from the University of Toronto Faculty of Medicine in 1923 and entered the service Dec. 17, 1942.

Commander John F. Oakley

Comdr. John F. Oakley, formerly of New Orleans, was recently awarded the Navy and Marine Corps Medal for heroism in action against the enemy on Saipan and Tinian during which, on several occasions, he continued to operate in an unprotected surgery despite fire and air raid alerts, after ordering other patients removed to places of relative safety. Dr. Oakley graduated from Tulane University of Louisiana School of Medicine, New Orleans, in 1929 and entered the service Sept. 26, 1942.

PHYSICIANS SEPARATED FROM SERVICE

ARMY MEDICAL CORPS OFFICERS RECOMMENDED FOR/OR RELIEVED FROM ACTIVE DUTY

Alabama

Fonde, William G., Capt., 301 Northwest Blvd., Chickasaw.
Holmes, Michael, Lt. Col., Abbeville.
Johnson, Simon O., Major, Veterans Adm., Tuskegee.
Rodriguez, Jose M., Capt., Louisville.

Arizona

Nugent, Arthur G., 1st Lt., 1024 9th St., Douglas.
Thayer, Kent H., Major, 808 Prof. Bldg., Phoenix.

Arkansas

Alford, Thomas D., Capt., 200 Midland Ave., Little Rock.
Brizzolara, Charles M., Capt., 217 E. 6th St., Little Rock.
Parsons, Wilfred R., Capt., 1620 Gaines St., Little Rock.

California

Batten, Charles T. Jr., Major, Camarillo State Hosp., Camarillo.
Brown, John W., Major, 1248 Arguello, San Francisco.
Carlson, Carl O., Capt., 511 Rutland St., San Jose.
Chain, John S., Major, 2220 E St., Eureka.
Cleave, David C., Lt. Col., P. O. Bldg., Beach Rd., Belvedere.
Cressman, Ralph D., Major, 386 Dana Ave., Palo Alto.
Danstrom, John R., Capt., 4220 Cedar Ave., Long Beach.
Darling, Herbert H., Lt. Col., 90 Woodland Ave., San Francisco.
Denicke, Ernest W., Major, 1010 B St., San Rafael.
Ehrlich, Alfred S., Capt., 9157 Alden Dr., Beverly Hills.
Fagan, Shuler F., Major, 1930 Wilshire Blvd., Los Angeles.
Freyermuth, Otto G. Jr., Capt., 35 Aptos Ave., San Francisco.
Geen, Robert S., Lt. Col., 3934 Greenwood Ave., Oakland.
Henning, Berthel H., Lt. Col., 71 Lopez Ave., San Francisco.
Heppner, George J., Capt., 450 Sutter, San Francisco.
Hfeld, Frederick W., Major, 1930 Wilshire Blvd., Los Angeles.
Jacobs, Joseph J., Lt. Col., 1478 38th Ave., San Francisco.
Kistler, Lewis M., Major, 1046 S. Wilton Pl., Los Angeles.
Kloss, Richard G., Lt. Col., 2623 Regent St., Berkeley.
Leimbach, John H. Jr., Capt., 728 22d St., San Francisco.
Mack, Edward G., Capt., 9615 Brighton Way, Beverly Hills.
Martin, Walter P., Capt., 5147 10th Ave., Los Angeles.
Masler, Sherman, Major, 4524 Sylmar, Van Nuys.
Maytum, Harry R., Major, 229 18th St., Merced.
Mell, Charles N., Major, 411 30th St., Oakland.
Mock, Duane V., 1st Lt., Orange County Hosp., Orange.
Moore, Herbert L., Capt., 935 B St., Eureka.
Novick, William, Capt., 650 S. Cochran Ave., Los Angeles.
Nuyens, Louis C., Capt., 184 Ewing Terrace, San Francisco.
Osborne, Clyde J., Capt., 3660 28th St., San Diego.
Parker, James A., Capt., 615 L St., Merced.
Perlmutter, Henry A., Major, 2223 Channing Way, Berkeley.
Perry, William J., Major, 441 Salem St., Chico.
Pratt, John R., Capt., 8426 Ridpath Dr., Los Angeles.
Pucci, Ugo J., Capt., 1729 8th Ave., Sacramento.
Robinson, Louis L., Major, 1010 B St., San Rafael.
Roe, William F., 1st Lt., 2628 Armstrong Ave., Los Angeles.
Rustad, William H., Capt., 490 Post, San Francisco.
Snart, Bret W., Major, 281 Juanita Way, San Francisco.
Starr, Wilmer H., Capt., 1342 34 N. Edgemont, Hollywood.
Tainter, Eugene G., Capt., 2361 California, San Francisco.
Thale, H. B., Capt., L. A. County GH, Box 257, Los Angeles.

Colorado

Branley, John G., Capt., 2051 Elm St., Denver.
Forbes, Burton L., Capt., 1306 Humboldt St., Denver.
Kuykendall, Fred D., Capt., Eaton.
Lefevre, Harry W. Jr., Lt. Col., 2034 Dahlia, Denver.
Olsen, Frank R., Capt., Box 162, Center.

Connecticut

Adams, Arthur J., Capt., 839 Williams St., Bridgeport.
Berlowe, Max L., Capt., 35 Stimson Rd., New Haven.
Goldstein, Emanuel, Capt., Municipal Hosp., Hartford.
Josephs, William W., Major, 105 Dwight St., New Haven.
Lieberman, David L., Capt., Chester.
McGuire, Frank I., 1st Lt., 29 Whitfield St., Guilford.
Maisten, Sidney E., Major, 415 Woodland St., Hartford.
Massey, Daniel M., Capt., 1025 Noble Ave., Bridgeport.
Murphy, John C., Major, Inafield, Redding.
O'Connell, Edward B., Capt., 8 9th St., Derby.
Schneider, William, Capt., 34 Union St., Rockville.
Serrell, Howard P., Major, Taconic Rd., Greenwich.
Thorne, Lewis, Major, 109 College St., New Haven.

District of Columbia

Bukantz, Samuel C., Capt., 1020 19th St. N.W., Washington.
Suttenfield, F. D., Lt. Col., 1818 R St. N.W., Washington.

Florida

Chunn, Charles F., Major, 2416 Watrous Ave., Tampa.
Harmon, James P., Major, Box 568, Quincy.
Jennings, W. L., Capt., 807 N. Atlantic Ave., Daytona Beach.
McTurnan, Robert W., Capt., Tampa Municipal Hosp., Tampa.
Saslaw, Milton S., Major, 1238 S. W. 8th St., Miami.

Georgia

Dowman, Charles E., Major, 630 Lincoln Ave. N.E., Atlanta.
Gavin, James F., Major, Fort Gaines.
Norwood, S. W., 1st Lt., 1761 Westwood Ave. S.W., Atlanta.
Trimble, George N., Capt., Grady Hosp., Atlanta.

Idaho

Hancher, William H., Capt., Weiser.
Scott, Russell T., Major, Lewiston.
Smith, Robert S., Lt. Col., 1221 Harrison Blvd., Boise.
Stowe, Harwood L., Major, 125 Lincoln St., Twin Falls.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

Dec. 3, 1945.

Opposition to Truman Health Plan

Senator Robert A. Taft, Republican of Ohio, has disputed President Truman's denial that his \$3,000,000,000 a year health insurance program was not "socialized medicine." The District of Columbia Medical Society, through Dr. William Earl Clark, president, commented: "As President Truman has very well stated, there is nothing essentially new about his compulsory health insurance plan. The medical profession, like the President, believes in spreading costs of medical care by means of prepayment. It wants the people of this country to have the best medicine has to offer. Where it differs from him is that, in its opinion, this can best be accomplished through the voluntary system, which it believes is the American way of life."

Hospitals Get Priorities on Penicillin

The Civilian Production Administration, successor to the WPB, has given civilian hospitals, veterans' hospitals and the U. S. Public Health Service priorities in obtaining penicillin from suppliers. Military and emergency orders receive top priority, and civilian hospitals get second preference. The agency reports that penicillin supplies are sufficient for essential United States requirements but the priorities were given to safeguard hospital supplies in the face of rising foreign demands, particularly from Latin America. The CPA is arranging with the Department of Commerce to restore export controls on the drug. The trade reports production, quality and effectiveness of penicillin increased during the war. Production in 1945 is estimated at more than 8,500,000,000 units, five times above 1944 production.

Hospitals Discuss Adjustment to Peacetime

The fifth annual meeting of the Maryland-District of Columbia Hospital Association, held November 29 and 30 at Baltimore, discussed adjustments to peacetime operation by hospitals. Affiliating groups are the Maryland Association of Hospital Pharmacists, Maryland Association of Medical Record Librarians, District of Columbia Association of Medical Record Librarians, District of Columbia Dietetic Association, American Association of Social Workers, Potomac District, and the Maryland Dietetic Association.

Posthospital Care for Alcoholic Addicts

The Women's Safety Committee of the American Automobile Association was advised by two District of Columbia medical men that posthospital therapy should be given to reduce alcoholism. Dr. Daniel I. Seckinger, deputy District health officer, and Dr. Leopold Wexberg, director of the District Alcoholic Clinic, said that facilities are badly needed in the capital for the treatment of alcoholic addicts.

President Truman Appeals for Safety Campaign

Federal agencies and departments have been asked by President Truman to conduct safety campaigns to cut the expense of accidents and fatalities to federal workers, which cost the government \$67,500,000 last year. The chief executive in his message to the annual meeting of the Interdepartmental Safety Council outlined a six point program intended to remove work hazards, which killed 717 workers and seriously injured 81,000.

National Nutritional Program Being Studied

A national nutrition program to raise dietary standards is being considered by the Truman administration. The program is said to involve government subsidization of family supplies where there is lack of income to guarantee an adequate diet. The Department of Agriculture has submitted plans on raising

dietary standards to the White House. The plans suggested include a broader school lunch program, including hot lunches in every public school, the financing to be by federal, state and local school governments. A relatively small number now receive lunches at government expense. Senators Aiken, Republican of Vermont, and La Follette, Progressive of Wisconsin, introduced a bill calling for food stamps similar to those used in the thirties to dispose of farm surpluses.

Council on Medical Service and Public Relations

MINUTES OF THE MEETING OF OCT. 18, 1945

The meeting was called to order by the chairman, Dr. E. J. McCormick, at 10:35 a. m. in the Board of Trustees room of the American Medical Association headquarters.

Members Present.—Dr. John H. Fitzgibbon, Dr. James R. McVay, Dr. A. W. Adson, Dr. Thomas A. McGoldrick, Dr. Louis H. Bauer, Dr. W. R. Brooksher, Dr. Olin West, Dr. Joseph S. Lawrence and Mr. Thomas A. Hendricks, secretary, and Mr. George W. Cooley.

Guests Present.—Mr. Louis A. Neff, American Cancer Society; Dr. Joseph S. Wall, president, American Academy of Pediatrics; Dr. Clifford C. Grulec, secretary, American Academy of Pediatrics; Dr. H. H. Skinner, Yakima, Wash.; Dr. James McLeod, president, South Carolina Medical Association; Dr. F. H. Falls, American Association of Obstetricians and Gynecologists; Mr. M. L. Meadors, director of public relations, South Carolina Medical Association.

Approval of Minutes.—On a motion by Dr. Adson, seconded by Dr. Fitzgibbon, the minutes of the meeting of June 21 and 22 were approved.

Annual Report.—Mr. Hendricks stated that the annual report of the Council was ready for publication.

Supplementary Report.—It was decided that the secretary and chairman of the Council should prepare a supplement to the annual report and present it to the Council members for approval at the December meeting. Definite suggestions as to the form of the supplementary report were made by Dr. Fitzgibbon and Dr. Adson, particularly as to the recommendations to be presented to the House of Delegates.

The Budget.—After some discussion Dr. Adson moved that Mr. Hendricks and Dr. Lawrence confer with Dr. West with reference to readjustments within the budgets of the two offices. Dr. McVay seconded the motion and it was carried.

Rating Committee.—It was announced that a meeting of this special committee was in progress in another part of the building with Dr. Sensenich in charge.

Michigan Invitation.—After discussion as to the next meeting of the Council, the secretary was instructed to wire an acceptance for the Council to attend a special meeting of state society presidents and other presidents sponsored by the Michigan State Medical Society on Sunday, December 2, at Hotel Continental.

Regional Conferences.—After considerable discussion as to various areas and cities in which conferences might be held, it was decided to leave this matter until the December meeting for a definite outline as to future programs.

E. M. I. C. Program.—Dr. Wall read an analysis of S. 1318. Members and guests discussed it at length. It was felt that the American Medical Association should take the leadership in regard to this and other bills. Dr. Skinner was asked to confer with Drs. Bauer and McGoldrick and Fitzgibbon in regard

to a motion he desired to put and in the recommendations for the Public Relations Conference.

American Cancer Society.—Dr. Bauer moved that the Council recommend approving the work under the program of the Service Division of the American Cancer Society. Dr. McGoldrick seconded the motion and it was carried. It was decided that no publicity should be given this approval until the House of Delegates had taken action on the report.

Prepayment Medical Care.—Holbrook Plan: Dr. Adson reviewed Col. Paul Holbrook's plan in some detail. It was suggested that the Council recommend that Colonel Holbrook and General Hawley be invited to address the House of Delegates with reference to the plan.

Hawkins Plan: Dr. Adson presented the Hawkins plan in detail and read questions he had raised and Mr. Hawkins' answers to the question. There was discussion of the plan by the Council members. Dr. Bauer moved that no further action be taken on this until Saturday morning when we have a report from the round table. Dr. Adson seconded the motion, which was carried.

Report of Mr. Cooley.—Mr. Cooley read his report on prepayment medical service plans. Dr. Brooksher made the motion that Mr. Cooley be commended on his report, which was seconded by Dr. Adson. Motion carried.

The motion was made and amended to read "the Council appoint an advisory committee to study the entire picture of medical service plans under the direction of the Council for the benefit of the Council and the American Medical Association and all component societies." This motion was carried. The chairman of the Council is to appoint the members of this committee.

Additional Personnel Needs.—Mr. Hendricks suggested that a number of field men be employed. It was decided that one field man should be employed and trained both in the Washington office and at headquarters.

Mr. Hendricks was instructed to look into the possibility of securing a man to assist in publicity work for the Council. He was instructed to make a report on progress along this line at the December meeting of the Council.

Men in Service.—There was considerable discussion on all phases of this problem. It is the consensus that everything possible be done to assist men in service.

Washington Office.—Dr. Lawrence reported on the work being done by the Washington office. He asked for definite information on A. M. A. opinion of bills at an early point so that he might be better able to talk with persons he meets in his Washington work. This brought up the question of interim authority. The opinion was expressed by Dr. Bauer that no action should be taken until the Trustees had expressed an opinion.

Council Representative at Wagner-Murray-Dingell Hearings.—No action was taken. It is the consensus that Dr. West will call on the Council if the need is felt.

Council History for Centennial Celebration.—The chairman, Dr. McCormick, instructed Mr. Hendricks and Dr. Bauer to prepare such a history.

Plan of Association of Industrial Surgeons and Physicians.—The Council feels that it cannot take action until it has further details.

Subscription to Public Health Economics.—It was felt that the Council office should have this publication and abstract articles of interest to Council members and supply them.

Next Meeting of Council.—A motion was carried that the Council meet at 9 o'clock on Sunday, December 2.

Interpretation of Fourteen Point Program by Dr. Bauer.—Dr. Bauer read the material he gave in Kansas City, and the Council heartily endorsed this paper and requested that it be printed with the full approval of the Council.

The meeting was adjourned at 11 o'clock Thursday evening, October 18.

E. J. MCCORMICK, M.D., Chairman.
THOMAS A. HENDRICKS, Secretary.

PREPAID MEDICAL CARE NEWS

Wisconsin

The State Medical Society of Wisconsin has approached the problem of prepayment medical care from a quite different angle than that of most medical societies. At the meeting of the society's house of delegates in November a plan was approved authorizing cooperation with private insurance carriers. While two local medical societies, one in Illinois and one in Ohio, have approved similar proposals for their own local areas, neither program is as far reaching as the Wisconsin action.

The 1944 Wisconsin house of delegates started the idea of using private carriers by approving a resolution which provided in part that "a proper committee of this society be instructed to confer with licensed insurance companies in this state in an effort to secure the extension of sickness care policies to a point as to provide the broadest comprehensive coverage possible within a premium structure that particularly appeals to the so-called low income group." This committee was appointed with Dr. H. H. Christofferson of Colby, Wis., as chairman. Other members were Drs. L. A. Copps, Marshfield; Charles Fidler, Milwaukee; C. E. Pechons, Kenosha, and C. O. Wingom, Madison.

A year later, in November 1945, the committee submitted a detailed report providing for the "Wisconsin Plan." In its report the committee proposed "that the medical profession of Wisconsin enter into agreement with such insurance carriers licensed in this state as are willing to do so providing for the "Wisconsin Plan" of prepaid insurance for the care and treatment involved in the fields of surgery, obstetrics, associated anesthesia and radiology, and hospitalization, embracing the following general points:

1. The "Wisconsin Plan" shall be approved by the State Medical Society of Wisconsin and in the form so approved, and without variation, shall be available to any licensed insurance company in Wisconsin for use in accordance with its terms.
2. The "Wisconsin Plan" shall provide:
 - a. Full coverage benefits for care involved in the fields of surgery and obstetrics, whether given in or out of a hospital;
 - b. Full coverage benefits for anesthesia and radiology, when given outside of a hospital;
 - c. Broad benefits for hospitalization and therapeutic services performed in the hospital.
3. Income limits for those on the service plan basis will be \$2,080 annually per single person and \$2,600 for married persons.
4. Free choice of medical physicians is to be provided.
5. For nonhospitalized cases, the maximum anesthesia benefit is \$15, and for miscellaneous operative radiology procedures the maximum is \$35.
6. The total maximum hospital benefit will be \$180.
7. The premium will be divided into two groups, the lower being for those who join as a part of a group and the higher for those who join individually.

Announcement by Abbott Laboratories of a Medical Expense Insurance Plan for Employees' Dependents

The directors of Abbott Laboratories have announced the adoption of a medical expense insurance plan for the dependents of their employees. This is an addition to the surgical plan now in operation.

The employees are at present insured for daily hospital and surgical benefits. The new plan will provide a limited protection for employees' dependents. The benefits include \$2 for each office or hospital visit and \$3 for each visit by the physician to the home. The limit is one visit a day per dependent and fifty visits per dependent in any one calendar year. In addition, laboratory fees and examination up to \$25 a year are included.

This plan supplements for employees' dependents the insurance already in effect covering hospitalization and surgical benefits. The company also has a group accident and employees' health insurance policy.

SURPLUS MEDICAL AND HOSPITAL SUPPLIES

The Committee on Postwar Medical Service of the American Medical Association, December 1, adopted the following report, made by its subcommittee (Dr. Ernest E. Irons, Dr. Morris Fishbein, Dr. George M. Piersol, Miss Mary Switzer and Father Alphonse M. Schwitalla, chairman):

Legislative History

To understand the present situation with reference to surplus supplies, a brief review of the legislative history of the Surplus Property Act of 1944 is necessary (Public Law 457, 78th Congress, Approval Oct. 3, 1944).

The Surplus Property Act as passed by the Senate was not identical with that passed by the House. The Senate bill extended equal consideration to public and nonpublic educational and public health institutions. The House bill gave no specific status to nonpublic or non-tax supported agencies.

On the last day of the debate in the Senate, Senator LaFollette introduced an amendment which purported to give state and municipalities a time priority so that they may compete on a basis of equality with nonprofit non-tax supported agencies which did not have to attend particularly to purchasing regulations and requirements. The amendment was embodied in the final act in a modified form and is designated as section 13 (f):

The disposal of surplus property under this section to states and political subdivisions and instrumentalities thereof shall be given priority over all other disposals of property provided for in this act."

On the basis of this provision, the legal department of the Surplus Property Administration ruled that states and political subdivisions and instrumentalities thereof have a priority not merely of time but, since a mere time priority would be useless, also a priority of access to information and a subsequent prior right to purchase surplus property.

A number of private agencies, as, for example, the American Council on Education, have consistently urged that the legislative history of the act modifies the term "priority" in such a way that it should be interpreted as conveying only a time priority to state institutions. The protests of a number of private agencies is a matter of record. Mr. Symington declined to accept this interpretation of section 13 (f).

On Oct. 17, 1945 a meeting was held of the officials of the Surplus Property Administration, of the Public Health Service and of the members of the advisory group. A regulation was discussed which would have set up a definite reserve for institutions performing a public health service. The term "a public health service" was understood in a very wide sense as meaning any service conducive to the public health. This liberalization of terms paralleled a previous liberalization of the term "tax supported institution" as meaning any institution which receives moneys from public sources for services rendered to public agencies (a hospital receiving E. M. I. C. funds, for example, would thus be considered as a tax supported institution). The Public Health Service was designated as the administering agency for health and hospital supplies. Not only was it to have the power to state what type of property should be reserved and the amounts to be reserved for special uses or for disposal but also it was to certify the institutions eligible for the procurement of such property. Applications by institutions were to be submitted for approval to the Public Health Service.

At this meeting public health authorities requested that, as a condition for eligibility to receive surplus supplies, financial statements be submitted in support of a claim for need of surplus property and in support of preferential allocations with reference to relative need. Several agencies opposed this demand of the Public Health Service, but it was upheld by the Surplus Property Administration.

At the conclusion of the meeting, suggestions were made concerning the revision of the regulations. Specific recommendations were made to the officials of the Surplus Property Board

with the view of materially benefiting hospitals, schools and charitable institutions. Some of these suggestions were incorporated in the suggestions promulgated on Nov. 6, 1945.

On Nov. 2, 1945 a joint meeting of representatives of the Federal Security Agency, of the Public Health Service and its advisory committee and of the Office of Education and its advisory committee took place on call by the surplus property administrator. At this meeting a new draft of the regulation was discussed. This new draft had a tendency to eliminate the Public Health Service and the Office of Education as agencies for certifying eligibility of institutions for surplus properties. The Public Health Service and the Office of Education accordingly refused to approve the new regulation and undertook the revision of the draft which had been presented at this meeting. Under date of Nov. 6, 1945 a new set of regulations, S. P. A. Regulations No. 14, was published and this set of regulations is the result of the joint effort of the representatives of the Federal Security Agency, the Office of Education and the United States Public Health Service. If the criteria to be established on the basis of the new regulations are in harmony with the intent of Congress, these new regulations should be satisfactory to both the tax supported and the non-tax supported institutions. If, on the other hand, the new criteria do not carry out the intent of Congress, the non-tax supported institutions will be at a distinct disadvantage.

Regulation No. 14

Regulation No. 14 bears date of Nov. 6, 1945 and was issued Nov. 21, 1945. In his letter of transmittal the director of the Office of War Property Distribution says that the regulation was designed "to effectuate section 13 of the Surplus Property Act of 1944." The regulation recognizes the Federal Security Agency as the certifying agency for the disposal of surplus property in the health, educational and nonprofit fields and for the performance of the other functions necessary in such disposal. A Policy and Procedure Memorandum No. 2, Nov. 8, 1945, of the Federal Security Agency, Office of War Property Distribution, authorizes the United States Public Health Service to perform these various functions for the Federal Security Agency, as far as there will be disposal to, and utilization by, public health institutions and instrumentalities. The letter of transmittal further informs the recipient that the Division of Surplus Property Utilization of the United States Public Health Service is at present engaged in developing criteria and procedures for the distribution and utilization of surplus property for public health use. It is expected that these criteria will be completed at an early date and that they will be ready shortly for review by the advisory committee and for evaluation at a meeting of the advisory committee to be held some time in the week of Dec. 10, 1945.

According to the Policy and Procedure Memorandum No. 2, the United States Public Health Service under the authority of the director is charged with the obligation of performing the following functions: (1) the preparation of certified lists of public health institutions and instrumentalities; (2) the preparation of estimates and recommendations concerning property to be reserved for public health institutions and instrumentalities; (3) the development of criteria for the determination of legitimate and relative needs of public health institutions and instrumentalities; (4) the establishment of procedures under which applications by or for public health institutions and instrumentalities will be submitted and reviewed and the procedures to be followed for action subsequent to the review; (5) cooperation

with disposal agencies with respect to the giving of notices of available surplus property to public health agencies; (6) such other functions as may be necessary to fulfil the purposes and functions of Regulation No. 14 and in fulfilment of the intent for the public welfare of the entire act.

A number of significant passages—not all of them—might be here quoted:

1. *Scope*.—"This part grants to nonprofit institutions the opportunity to acquire surplus property and, in the case of educational and public health institutions, the right to a discount" (paragraph 8314.3).

2. *General Policy*.—"Section 13 (a) of the Surplus Property Act of 1944 provides generally, to the extent feasible, for transfer of surplus property on the basis of need to nonprofit institutions and instrumentalities so that they may have the opportunity to fulfil in the public interest their legitimate needs, and that surplus property that is appropriate for school, classroom or other educational use, and surplus medical supplies, equipment and property suitable for use in the protection of public health, including research, may be disposed of at a value which takes into account any benefit which has accrued or may accrue to the United States from the use of such property" (paragraph 8314.3).

3. *Eligibility*.—"The Federal Security Agency is charged with the responsibility for submitting to the surplus property administrator certified lists of institutions and instrumentalities eligible for the benefits provided under this part" (paragraph 8314.4).

4. *Criteria*.—"The Federal Security Agency shall develop criteria by which to determine legitimate needs of nonprofit institutions and instrumentalities which apply for surplus property under this part" (paragraph 8314.6).

5. *Disposals*.—"Any nonprofit institution whose application is approved by the Federal Security Agency, or on appeal by the surplus property administrator, shall be entitled to acquire from disposal agencies any surplus property available for disposal, at the fair value of such property and in lots not smaller than the smallest lots consistent with commercial practice" (paragraph 8314.8).

6. *Fair Values*.—"Such fair value shall not be greater than the lowest price which is offered to any trade level at the time of acquisition by the nonprofit institution or instrumentality" (paragraph 8314.9).

7. *Discounts*.—"Disposal agencies shall allow from the fair value of property as set forth in paragraph (a) a discount of 40 per cent on orders by or for educational or public health institutions or instrumentalities" (paragraph 8314.9).

8. *Certificate of Need*.—"Each application to the Federal Security Agency by or for a nonprofit institution or an instrumentality eligible for the benefits of this part shall bear a certificate by a responsible officer thereof that the property sought by the applicant is required for its own use to fill an existing need of the applicant and that it will not be resold to others within three years of the date of purchase without the consent in writing of the disposal agency" (paragraph 8314.10).

Disposal at Present of Surplus Property

Questions have been repeatedly asked by various agencies concerning the regulations and provisions under which disposition is now being made of surplus properties. A word concerning these is not out of place:

1. Army Procurement Regulation No. 7 permits army area commanders to dispose of property suitable for vocational education to those institutions which have conducted preinduction courses or which are now conducting courses for the training of men needed by the Army.

2. Surplus Property Administration Regulation No. 9 provides that local commanders of the Army may award surplus property to institutions, such as educational institutions, pro-

vided the value of the property does not exceed \$300 and provided further that the property so disposed of is considered and declared "salvage," the term salvage being given a broad interpretation.

3. Apparently, property is even now being acquired under Regulation No. 14, Nov. 6, 1945, at sharp discounts, approximating 30 per cent or even more of retail prices.

Educational institutions have (1) contacted the local commanders of stations in which army properties have been in use during the war and have made arrangements for the purchase or removal of such properties or (2) they have sent lists to the corps area commanders through personal contacts and have been notified by such corps area commanders when the property is available or (3) they have contacted the local area commander, who has transmitted requests to the corps area commander directly for authorization or who has transmitted the request to the corps area commander through some state agency appointed for the purpose, in one state, the state board of education.

Disposal of Surplus Property to Individual Practitioners

On behalf of the American Dental Association, Dr. Camalier has taken great interest in clarifying the issues with reference to preferential concessions to dental veterans. He has taken a stand against special priorities and price concessions to dental veterans "applying for this material, who happen to state that they will practice in an area deemed critical by the United States Public Health Service and that other veterans, who may desire to practice in other states (where the need is) not deemed so acute, will not receive similar price concessions."

In his letter to Major L. F. Young, Sept. 19, 1945, Dr. Camalier reasons as follows: There is not now a proper distribution of dentists throughout the United States and there are areas of crucial shortage. But, as far as dentists are concerned, practically every community needs dentists and, wherever a veteran may locate, his services will be greatly needed. Dentists are not free to move from state to state. Nearly all dentists have licensure in one state. An adequate reciprocity plan has not been developed, and moving into another state means taking another examination for licensure. Since this situation exists, it would do no good to give priorities and price concessions for the purchase of dental equipment to dentists who locate in areas designated by some governmental agency and deemed an area of critical need. Such a procedure would not solve the problem of distribution of dentists. If such concessions and priorities are deemed desirable, they should be extended to every dentist veteran, no matter where he locates.

The promulgation of Regulation No. 7 and the listing in periodical journals of the regional officer of the Smaller War Plants Corporation has caused veteran dentists to apply quite generally for purchases of surplus material, and many have delayed opening their offices because they are waiting for word about the disposal of this surplus property. This has caused great confusion. Regulations should be eliminated. The priorities, price concessions, et cetera, should be greatly liberalized; otherwise the veteran dental officer "will be home many months before he is able to start practice." Dental equipment must be made available to the returning veteran dental officer in the simplest possible way without delay.

What is said here by Dr. Camalier concerning dental veterans should probably be said about physician veterans.

Coming Medical Meetings

American Academy of Allergy, Chicago, Dec. 10-11. Dr. Karl D. Figley, 316 Michigan St., Toledo 2, Ohio, Secretary.
American Society of Anesthetists, New York, Dec. 12-13. Dr. McKinnie L. Phelps, 745 Fifth Ave., New York 22, Secretary.
Puerto Rico Medical Association of, San Juan, Dec. 14-16. Dr. Rafael A. Vilar, P. O. Box 3866, Santurce, Secretary.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

ARKANSAS

Personal.—Dr. Vida H. Gordon has resigned as director of the crippled children's division, state department of public welfare, and will enter private practice in Little Rock.—Dr. William P. Scarlett, Morrilton, formerly health officer of Wichita, Texas, has been named health officer of Little Rock.

CALIFORNIA

Name of Research Laboratories Changed.—The name of Bureau of Research Laboratories of the California Department of Public Health has been changed to the Virus Laboratory of the Division of Laboratories.

Medical Board Election.—At the annual October meeting of the California State Board of Medical Examiners Dr. Frank W. Otto, Los Angeles, was elected president, Dr. Herbert S. Chapman, Stockton, elected vice president and Dr. Frederick N. Scatena, Sacramento, reelected secretary.

Hospital Advisory Board.—Dr. John C. Sharp, Salinas, medical superintendent of Monterey County Hospital, is chairman of the hospital advisory board appointed by Governor Earl Warren to assist the state department of public health in the administration of the new hospital act, according to *California's Health*.

Human Case of Anthrax.—One human case of anthrax has been reported from Sutter County resulting from an outbreak of the disease in dairy and beef herds. The human case occurred in a man who had skinned an animal which had died of anthrax in Sutter County. A lesion developed on his wrist the next day and he was advised by a veterinarian to see his physician. A diagnosis of anthrax was made and the patient was placed in the hospital and treated successfully with sulfathiazole and penicillin.

CONNECTICUT

Commission on Care of Aged and Chronically Ill.—Gov. Raymond E. Baldwin has appointed the members of a newly created commission for the care and treatment of the aged, infirm and chronically ill which was authorized by the passage of substitute for house bill 144 by the 1945 general assembly. Members of the commission and their terms of office are as follows:

Dr. Abraham N. Credick, New Haven, president of the Connecticut Cancer Society, three years.

Dr. Joseph H. Howard, Bridgeport, president of the Connecticut State Medical Society, two years.

John W. Lamb, Plainville, representative, Connecticut legislature, chairman of the committee on public welfare and humane institutions, two years.

James L. McConaughy, Cornwall, chairman, United China Relief, formerly lieutenant governor of Connecticut, formerly president of Wesleyan University, three years.

Frances B. Relick, Newington, formerly secretary of state, two years.

The state commissioner of health, Dr. Stanley H. Osborn, and the commissioner of welfare, Robert J. Smith, are ex officio members of the commission. The new statute directs the commission to "study the problems of care and treatment of the aged, infirm and chronically ill people of the state, plan, construct or purchase, lease or otherwise acquire and staff and operate such buildings as it deems necessary for the care of such persons. Said commission shall fix rates for care at such institutions and shall determine policies and adopt regulations necessary to carry out the provisions of this act." The statute empowers the commission to employ and fix the compensation of a director and such other employees as it may require and make the usual provision for a biennial report of findings, activities and recommendations to the governor and the general assembly. The appropriation originally requested for the project was reduced prior to passage of the bill to \$25,000, which is inadequate for the acquisition of land, buildings or other capital equipment but which will enable the commission to make a thorough and detailed survey of the scope of the problem, the existing facilities and additional components which are needed, in order that recommendations for a progressive program may be brought before the next general assembly.

ILLINOIS

Personal.—Dr. Donald E. Rossiter has been named president of the board of health of Highland Park, succeeding Dr. Morley D. McNeal, resigned.—Dr. Walter H. Baer, Peoria, was to return to his position as superintendent of the Manteno State Hospital November 1. Dr. Edward Ross has been acting superintendent of the hospital since Dr. Baer entered the Army in 1942.—Dr. Ruth E. Church, health officer of Washington County, Iowa, has been named to a similar position for the McDonough-Fulton bicounty health unit, effective about December 1.

Chicago

The Fenger Lecture.—The tenth Christian Fenger Lecture of the Institute of Medicine of Chicago and the Chicago Pathological Society will be delivered at the Palmer House on January 14 by Lieut. Col. Baldwin E. W. Lucke, deputy director, Army Institute of Pathology, Office of the Surgeon General. His subject will be "Epidemic Hepatitis."

Dr. Phemister Honored.—To celebrate the twentieth anniversary of his chairmanship of the department of surgery, University of Chicago School of Medicine, residents, present members and past members of the department of surgery gave a dinner December 4 in honor of Dr. Dallas B. Phemister. The surgical residents staff presented a program at Billings Hospital in the afternoon. At an evening banquet a special bound volume of the December issue of the *Annals of Surgery*, which consisted of contributions of Dr. Phemister's pupils and former associates, was presented to him.

LOUISIANA

George McCoy Named Acting Dean at Louisiana.—Dr. George W. McCoy, professor and director of the department of public health, Louisiana State University School of Medicine, New Orleans, has been appointed acting dean. Dr. Wilbur C. Smith, who was named dean in September (*THE JOURNAL*, October 6, p. 470), has resigned.

MASSACHUSETTS

Graduate Course for General Practitioners.—The Lahey Clinic, Boston, sponsored a postgraduate course in medicine for general practitioners November 15-17. Methods currently used in the diagnosis of common clinical problems were covered in lectures and demonstrations by members of the staff of the clinic.

New Dean at Boston University.—Dr. Donald G. Anderson, Boston, recently associated with the distribution of penicillin, has been appointed dean of the Boston University School of Medicine. He succeeds Dr. Charles F. Branch. Dr. Anderson, who is 32 years of age, graduated at Columbia University College of Physicians and Surgeons in 1939.

Personal.—Dr. Charles F. Branch, formerly dean of Boston University School of Medicine, has been named director of Children's Hospital, Boston.—Charles A. Cook, Ph.D., formerly in charge of the Medical Biochemistry Department at the Lambert Pharmacal Company, St. Louis, has been appointed research director of the E. L. Patch Company, Boston. Dr. Cook's work has been concerned with the medical and biologic properties of the vitamins, proteins and amino acids, pituitary hormones and also synthetic and antibiotic chemicals which exhibit antiseptic activity.

MICHIGAN

Alpha Omega Alpha Lecture.—Dr. Isidor S. Ravdin, M. C., A. U. S., gave the Alpha Omega Alpha Lecture at Wayne University College of Medicine, November 15, on "Experiences on the Assam-Burma Border."

Knights of Columbus Post Named for Physician.—The sixty-five new members initiated November 4 by Port Huron Council Number 521, Knights of Columbus, adopted the name of the "Dr. DeGurse Class," honoring Dr. Thomas E. DeGurse, Marine City. The physician recently completed fifty years of practice in Marine City.

Changes in Health Officers.—Dr. Clayton C. Benjamin, Manistee, has resigned as health officer of Mason County to accept a similar position for the city of Port Huron.—Dr. Rolf Lanting, formerly of Gladwin, has been named health officer of Shiawassee County to succeed his wife, Dr. Helen Lanting. Owosso, who has been serving in the position for three years. Dr. Robert E. Flood, Northport, has been appointed director of district number 7 health unit to succeed Dr. Madeleine M. Donnelly, Gladwin.

Graduate Course in Internal Medicine.—The department of postgraduate medicine, University of Michigan Medical School, Ann Arbor, will devote a course in internal medicine in January and February to "Clinical Applications of the Basic Sciences." Teaching will be conducted by the preclinical faculty and, to a great extent, by staff members from the clinical departments. The various aspects of the fundamental sciences which have immediate bearing on the practice of medicine will be emphasized. Applications may be addressed to Dr. Howard H. Cummings, chairman, Department of Postgraduate Medicine, University Hospital, Ann Arbor.

NEW HAMPSHIRE

Dr. Frechette Goes to Massachusetts.—Dr. Alfred L. Frechette, secretary and state health officer of the New Hampshire State Board of Health, Concord, has resigned to become health officer of Brookline, Mass. Major John S. Wheeler, formerly deputy health officer in New Hampshire, has been appointed acting health officer as of December 1.

NEW YORK

Tuberculosis Association Observes Silver Anniversary.—The Cattaraugus County Tuberculosis and Public Health Association celebrated its twenty-fifth anniversary October 11 with a banquet at the Olean House, Olean. Dr. Herman E. Hilleboe, Washington, chief of the tuberculosis control division, U. S. Public Health Service, was the guest speaker.

New York City

William Laurence Honored.—William L. Laurence, science reporter of the New York Times, has been given the annual award of the Society of Silurians for the best editorial staff achievement by a New York City newspaper man for 1945. Mr. Laurence won the honor for his articles on the development of the atomic bomb. The award included a scroll and a \$100 war bond. The Silurian Society is composed of active and former newspapermen who served on New York City newspaper editorial staffs twenty-five or more years ago.

Food, Nutrition and World Populations.—The annual dinner and meeting of the New York Academy of Sciences will be held at the Hotel Astor, December 19. "Food, Nutrition and World Populations" will be the theme of the meeting, with Dr. Frank G. Boudreau, director, Milbank Memorial Fund, discussing "Nutrition as a World Problem"; Otto A. Bessey, Ph.D., director of the division of physiology and nutrition, Public Health Research Institute of the City of New York, "Nutrition as an Exact Science," and Charles G. King, Ph.D., scientific director, the Nutrition Foundation, Inc., "The Future of Nutritional Science."

NORTH CAROLINA

Needs of Children in a Postwar World.—North Carolina has been selected as the first state in which the American Academy of Pediatrics will conduct a thorough fact finding survey to determine the needs of children in a postwar world in order that the medical mind may assume the leadership in making available the facilities with which these needs are to be met. Dr. Joseph Lachman, director of the Pulaski County Health Department, has been assigned by the U. S. Public Health Service to the North Carolina Pediatric Society to serve as executive secretary. In December a short questionnaire will be sent to every physician in the state. Four avenues of approach will be followed:

Health studies for children, the survey to cover the extent of quality of such services—child health conferences, school health services, immunization, child guidance and public health nursing.

Distribution, qualification and activities of professional personnel, with the fact in mind that most of the pediatricians are in cities, but, even then, that much of the care of children is given by general practitioners. In this phase of the study, data will be collected on the distribution of pediatricians, general practitioners and specialists. An attempt will be made, through special questionnaires, to estimate the amount of time devoted by general practitioners to the care of children, and it is hoped also to obtain information relating to the size of the case load, outpatients, clinics and laboratories.

Hospital location, cooperation and character of public health facilities available, nervous and mental hospitals, tuberculosis, contagious and convalescent.

Education of physicians with reference to children, including medical schools to determine the quality and quantity for the training of child care. Data will be obtained on staff, curricula, number of pediatric beds available for teaching and opportunity for study of such pediatric cases as allergy, rheumatic fever and mental hygiene. One of the most important aspects of the survey will be that of the medical and the activities of public health, including the providing of doctor and medical services to children by state and local health departments, as well as by voluntary agencies. This phase of the survey will include child health conferences, mental hygiene clinics and school health programs as well as public health nursing concerned with children.

Dr. Arthur H. London Jr., Durham, is president of the North Carolina Pediatric Society.

NORTH DAKOTA

New Director of Maternal and Child Health.—Dr. Russell O. Saxvik, who was recently released from service in the Army of the United States, has been appointed director of maternal and child health for the North Dakota State Department of Health. Dr. Saxvik graduated at the Rush Medical College in 1940.

OHIO

The Lower Lecture.—Dr. Charles S. Best, professor of physiology, University of Toronto Faculty of Medicine, delivered the annual Lower Lecture before the Academy of Medicine of Cleveland November 16 on "Hormonal and Dietary Factors in the Pancreas."

Toledo Postgraduate Day.—The twelfth annual Postgraduate Day, held under the auspices of the Medical Institute of the University of Toledo November 2, was designated a memorial to the late Dr. John G. Keller. This custom of honoring a graduate of the old Toledo Medical School has been in effect since the Postgraduate Day was established.

Historical Museum Dedicated.—On October 6 the Cleveland Medical Library Association dedicated the Howard Dittrick Museum of Historical Medicine in honor of its founder, Dr. Howard Dittrick, retiring president of the library association. A feature of the program was the presentation of a portrait of Dr. Dittrick to the library. The picture is the work of Mary Seymour Brooks. The Museum of Historical Medicine was named in honor of Dr. Dittrick last year (*THE JOURNAL*, Dec. 30, 1944, p. 1159). Dr. Dittrick became curator of the museum in 1928 and director in 1935.

Prentiss Foundation Awards \$500,000 for Biochemistry.—The Elisabeth Severance Prentiss Foundation of Cleveland has made a grant which will amount to about \$500,000 to finance a greatly expanded department of biochemistry at Western Reserve University School of Medicine, Cleveland. The money will be paid to the university in quarterly payments over a ten year period, subject to certain conditions. The selection of a department head is now under way. The chair of biochemistry was left vacant recently when Victor C. Myers, Ph.D., was named director of a newly created department of clinical biochemistry (*THE JOURNAL*, August 25, p. 1239). According to an announcement, the school of medicine will follow the British pattern of having one department of biochemistry to carry on research and give instruction in chemistry as it affects all forms of life and another to perform a similar function as it affects more direct clinical observation and the diagnosis of human illness.

WEST VIRGINIA

Changes in Health Officers.—The following physicians have been appointed part time health officers of the places indicated: Charles R. Kessel, Ripley, Jackson County; Perry F. Marks, Walton, Roane County; James W. Stokes, Hinton (part time for the city of Hinton), and Jerome C. Arnett, Rowlesburg, who will serve temporarily as health officer for Preston County in the place of Dr. Charles Y. Moser, Kingwood.

Hospital Field Representative Named.—Mrs. George Fordham, formerly hospital superintendent and director of nurses at Laird Memorial Hospital at Montgomery, has been appointed by Dr. John E. Offner, Weston, state health commissioner, as hospital field representative for the division of maternal and child health. The new office was created to provide nursing supervision to hospitals accepting patients under the E. M. I. C. program.

Association of Pathologists Organized.—The Association of Pathologists of West Virginia was organized in Morgantown, October 26-27, with Dr. Clement C. Fenton, professor and head of the department of pathology, West Virginia University School of Medicine, Morgantown, as president and Dr. William T. McClure, Wheeling, secretary-treasurer. Speakers at the meeting included:

Dr. Fenton, Problem of Technicians.

Dr. Edward J. Van Liere and Gideon S. Dodds, Ph.D., both of Morgantown, Newly Formed West Virginia University School of Medical Technicians.

Dr. Eugene De Angelis, Morgantown, The Use of Plastics to Replace Cover Glasses in Microscope Slide Preparations.

Dr. Walter J. G. Putschar Jr., Charleston, Rocky Mountain Spotted Fever.

Special Society Elections.—Dr. William F. Beckner, Huntington, was elected president of the West Virginia State Conference of Social Workers at the annual meeting held in Charleston early in October. Dr. Leo H. Mynes, Charleston.

director of health service for Kanawha County schools, has been reelected president of the West Virginia Tuberculosis and Health Association for the fifth consecutive year. Other officers elected include Dr. William P. Bittinger, Summerlee, vice president; Miss Mae M. Maloney, Charleston, secretary, and Robert C. Hawkins, Charleston, treasurer.

Personal.—Drs. Frank V. Langfitt, Clarksburg, Walter W. Point, Charleston, and John J. Brandabur, Huntington, have been appointed members of the Public Health Council for terms ending June 30, 1949. The new appointees, who take office immediately, succeed Drs. Morgan T. Morrison, Sutton, Benjamin H. Swint, Charleston, and William C. D. McCuskey, Wheeling, who have served for several years as members of the council.—Dr. Orin R. Yost, Aiken, S. C., has been named superintendent of the Weston State Hospital (mental), Weston, to succeed Dr. Harry A. Garrison, who resigned as superintendent several months ago (*THE JOURNAL*, July 21, p. 893). Dr. H. O. Van Tromp, French Creek, has been acting superintendent since July 1. Dr. Yost was to take over the new work December 1.—Dr. Lawrence F. Boland, Williamson, has been named health officer of Mingo County, succeeding Dr. Sixtus G. Zando.

GENERAL

Special Society Election.—Dr. Eugene M. Blake, New Haven, Conn., was elected president of the American Ophthalmological Society at its meeting in Hot Springs, Va., November 12-14. Dr. John Burke, Washington, D. C., is vice president, Dr. Walter S. Atkinson, Watertown, N. Y., secretary-treasurer, and Dr. Wilfred E. Fry, Philadelphia, editor of the *Transactions*.

Extend Service for Handicapped.—At the suggestion of the Baruch Committee on Physical Medicine, the National Society for Crippled Children and Adults, Chicago, plans to establish immediately a central national registration and placement service for trained specialists in such work who are now in the armed forces and may want to continue their work in civilian life. A director of the employment exchange will be employed who will also be in charge of clearance of information on training facilities and scholarships for all persons, either civilian or military, who wish either to continue or to enter any phase of work for the handicapped.

The Louis Livingston Seaman Fund.—The New York Academy of Medicine announces the availability of the Louis Seaman Fund for the furtherance of research in bacteriology and sanitary science. One thousand dollars is available for assignment in 1945. This fund has been made possible by the terms of the will of the late Dr. Louis Livingston Seaman and is administered by a committee of the academy. The committee will receive applications either from institutions or from individuals up to December 1. Communications should be addressed to Dr. Wilson G. Snüllie, chairman of the Louis Livingston Seaman Fund, 1300 York Avenue, New York 21. The fund will be expended only in grants in aid for investigation or scholarships for research in bacteriology or sanitary science. The expenditures may be made for the securing of technical help, aid in publishing original work and the purchase of necessary books or apparatus.

Organic Antimony Compound for Treatment of Filariasis.—Drs. Theodore G. Klumpp, New York, Justus B. Rice, New York, vice president in charge of medical research, Winthrop Chemical Company, Inc., and Dr. Harry M. Rose and James T. Culbertson, Ph.D., both assistant professors of bacteriology at Columbia University College of Physicians and Surgeons, New York, are checking on clinical experiments at the School of Tropical Medicine, San Juan, Puerto Rico, used in organic antimony compounds in the treatment of filariasis. Stalbanose, a new organic antimony compound, and Neostibosan, both developments of the Winthrop Laboratories, have been used in the clinical tests conducted for the past year at the San Juan School of Tropical Medicine. First publication on the experiments was a scientific paper prepared by the Columbia University scientists and read before the meeting of the American Society of Tropical Medicine in Cincinnati November 15.

Pooling of Funds Urged in Health Report.—The pooling of the present separate competitive money raising appeals of the separate health agencies into a national health campaign, which will make for more equitable distribution of funds, is urged in a recent report presented by Selskar M. Gunn, C.P.H., and Dr. Philip S. Platt, Ph.D., New York, through the National Health Council and under the auspices of the Rockefeller Foundation. The report involved field work and

research for three years on 568 agencies in sixty-five cities and twenty-nine states. The 1945 total intake for the fifteen principal health agencies, including their national and local units, amounted to \$58,000,000. This total included \$100,000 raised by the American Heart Association and \$16,500,000 raised by the National Foundation for Infantile Paralysis. There is \$94 available for treatment and research on each case of infantile paralysis, \$22 for each case of tuberculosis, \$8 for cancer and 3 cents for each cardiac case, the condition causing the greatest number of deaths. The report also urged the establishment of an effective health council in every community, representing a voluntary affiliation of all the local health organizations. Although the study credits the private agencies working in the fields of tuberculosis, cancer, mental hygiene, blindness and so on with much of the health progress of the twentieth century, it deplores their lack of central direction and planning. It points out that the individual health organizations have sometimes overlapped and duplicated one another's efforts. The report recommends the expansion of the work of the National Health Council, with a dynamic program and effective field services to function on request for member organizations throughout the country.

Disbursements for Poliomyelitis Care.—Close to \$1,000,000 in emergency aid to poliomyelitis epidemic areas was disbursed by the National Foundation for Infantile Paralysis in forty weeks of this year, Foundation President Basil O'Connor said October 24. Of this amount a little more than 75 per cent went to four states: North Carolina \$229,138, Illinois \$218,200, New York \$198,755.40 and Virginia \$106,092.51. The total for the country was \$986,526. The principal expenses in connection with poliomyelitis epidemics, he continued, are hospitalization, salaries of doctors and other professional personnel, purchase of special equipment and the transportation of patients. Infantile paralysis, he added, is one of the most expensive diseases in medicine. Few families can meet the cost of the average case of poliomyelitis, which is around \$1,000. Funds sent to states supplement resources of the foundation's county chapters, which retain every year, for the care and treatment of local poliomyelitis patients, one half of all contributions in the county to the annual March of Dimes. The other half goes to the national foundation for scientific research, education and emergency aid in epidemics. While there were fewer infantile paralysis cases throughout the country in the first forty weeks of this year than there were for the same period last year, twenty-six states reported higher totals than last year. Utah reported nine times its 1944 total, Texas and Massachusetts almost five times, and Oklahoma, Tennessee and Wyoming more than three times. So far this year \$30,000 in emergency aid has been sent to Utah, which experienced the most severe epidemic, in proportion to its population, of any state in the union. Funds sent to North Carolina, it was explained, are being used not only for victims of this year's outbreaks but for continuing care of patients from previous outbreaks. Tennessee received \$50,000 disbursed under the supervision of Dr. Robert H. Hutcheson, state health director. As of October 6, this year, Tennessee had reported 347 cases, compared with 103 for the entire year of 1944. Many other states too are still caring for victims of the 1944 epidemic, second worst in the nation's history, when 19,272 men, women and children were stricken. In forty weeks of 1945 a total of 10,259 cases have been reported for the United States.

Health Officers Act on Proposed Health Recommendations.—The Association of State and Territorial Health Officers announced the adoption of a resolution recommending that responsibility of school health programs be recognized as a joint responsibility between the health and education department of federal, state and local levels. In general, the resolution pointed out, health education and physical education of school children should be regarded as the primary responsibility of the department of education working in cooperation with and with the assistance of departments of health. The resolution further recommended that appropriate federal agencies be requested to carry out research and demonstrations in order to develop improved techniques for school health medical services and to evaluate existing techniques, carry out surveys to evaluate current practice in this field and determine needs for expansion of services and seek federal funds for the expansion of school health programs in accordance with established needs, such funds to be allotted on a grant-in-aid basis to state health agencies. The proposed establishment of a department of public health and welfare with a cabinet officer at its head was also discussed by the association. If this organization is carried through, the association respectfully

recommends that adequate measures be taken to insure that public health receives sufficient freedom of action to carry on its important function of maintaining optional health for all the people. It is urgent that, if such a combined department is formed, permanent career undersecretaries or assistant secretaries be in charge of the two activities and that they be of equal rank. This is said to be, however, less desirable than the formation of a separate department of public health with a cabinet officer in charge, the association affirms. The association makes this recommendation in the interest of better public health administration on a federal level and the coordination of all civilian public health activities in a single department, thereby rendering liaison and cooperation with the several states and territories the more efficient and effective. This, in turn, would bring about an improvement in general public health work throughout the entire country and enable this department to administer any future legislation pertaining to public health with much greater efficacy, with a smaller administrative overhead for services rendered.

LATIN AMERICA

Health Activities in Latin America.—*Proposed Medical School in Trinidad.*—Work on the establishment of a medical school in Trinidad may be completed by October 1946, officials of the West Indian colony believe, it is reported. Formulation of plans for the creation of the institution will be entrusted to a commission of London University. In addition to furnishing the faculty, McGill University Faculty of Medicine, Montreal, is expected to supervise the activities of the new school. McGill authorities have consented to cooperate. In some quarters London auspices are preferred to the affiliation with Canada, it is reported. It is argued that a degree obtained in an auxiliary of a London institution would be registrable in the United Kingdom and in all West Indian colonies.

Visitors to the United States.—Dr. Fernando Carvalho Luz, Bahia, recently arrived in Miami on the Brazil Clipper of the Pan American World Airways, en route to New York for a year's study in surgery at Columbia University under a fellowship awarded by the Commonwealth Fund.—Dr. Gilberto G. Villela, chief of the division of chemistry and pharmacology, Instituto Oswaldo Cruz, Rio de Janeiro, Brazil, has joined the staff of the University of California Medical School, San Francisco, for the current term, as lecturer in pharmacology, according to the University of California Clip Sheet.—Dr. Aniceto Solares, formerly rector of the University of San Francisco Xavier, Sucre, Bolivia, is visiting the United States as a guest of the department of state. Dr. Solares is an ophthalmologist.

Personal.—Lieut. Col. Chester L. Davidson, M. C., has been named chief of the surgical service at Gorgas Hospital, Ancon, Canal Zone, to succeed Dr. Howard K. Tuttle, who retired recently to end twenty-seven years' affiliation with the Panama Canal Health Department. Colonel Davidson has been on duty with the health department since Jan. 9, 1944, having served as special assistant to Dr. Tuttle since last summer. Dr. Tuttle was assistant chief of the surgical service from 1922 to 1943. He was named chief on the retirement of Dr. Troy W. Earhart. He and his wife will leave Panama to establish residence in Hollywood, Calif.

Mexican Congress of Cancer.—The second Mexican Congress of Cancer of the Third Medical Week of the Occident will be held at Guadalajara, February 3-9. Dr. Manuel Riebeling is president and Dr. Enrique Garcia Ruiz is secretary.

Inter-American Congress on Radiology Postponed.—The second Inter-American Congress of Radiology, scheduled to be held in Havana next January (*THE JOURNAL*, April 21, p. 1068), has been postponed.

Radium Institute.—The Instituto Brasileiro de Radium, with headquarters in the hospital of Dr. Francisco Fernandes Eiras of Rio de Janeiro, was opened on July 23.

Physicians Strike in Argentina.—On October 8 the Argentine Medical Association decided "in principle to effect a partial strike of doctors," newspapers reported. In some of the main hospitals in Buenos Aires a partial strike was already in effect. This crisis was brought about by the dismissal of four doctors belonging to the staff of the Railroad Workers' Hospital who had refused to attend a function in honor of Juan Peron, vice president, organized by the secretary of labor and public welfare. All forty other doctors in the same hos-

pital immediately went on strike as a protest, and their actions have been copied by doctors of other hospitals. According to the plans of the medical association, doctors should refuse to attend any but the most urgent cases and should refuse to check in and out at hospitals, so that the government may not know which doctors are on strike and which are not.

Deaths in Other Countries

Maurice Arthus, at one time professor of physiology at the Faculty of Medicine in Lausanne and director of the Institut de Bactériologie et d'Hygiène, died in Fribourg, Switzerland, in February, aged 83.—**Herbert E. Durham, Sc.D.**, known for research in yellow fever, died in Cambridge, England, October 25, aged 79.—**Dr. Robert D. Gillespie**, physician for psychologic medicine at Guy's Hospital, died in London, aged 47.

Government Services

Regulations Governing Penicillin

All orders for penicillin from American civilian hospitals, U. S. veterans' hospitals and the U. S. Public Health service must be treated by suppliers as though the orders bear CC preference ratings, the Civilian Production Administration announced November 23.

Distributors ordering penicillin for hospital use will receive, on certification, the same preferential treatment. (Orders from army and navy hospitals already receive MM preference ratings.) The action was effected by issuing direction 4 to conservation order M-300. Supplies of penicillin are adequate to meet all essential requirements in this country, officials state. The purpose in issuing the direction is to safeguard hospital supplies in the face of rising foreign demand. The United States is the only large producer of penicillin. The Civilian Production Administration now is working with the Office of International Trade Operations of the Department of Commerce to restore export controls on this drug. Producers of penicillin are required to give CC preferential treatment to the orders covered by this direction, up to 40 per cent of their production in the preceding calendar month or of the estimated production in the current calendar month, whichever is greater. All the penicillin which a producer may purchase for resale is also subject to the direction. Because of the increased production of penicillin in tablet, capsule and ointment form, which has somewhat decreased production in the injection form used by hospitals, the direction requires producers, if possible, to operate their facilities in such a manner as to provide adequate quantities of penicillin in the dosage forms required to fill hospital and certified orders. The same rule applies to persons purchasing penicillin for resale when they possess facilities for preparing the drug in dosage form. Monthly reports of production, stocks and shipments will be required from producers, and from distributors who buy penicillin from producers for resale under the distributors' own labels. Civilian Production Administration officials said that the issuance of this direction will not affect the obligation of suppliers to give first preference to orders bearing AAA (emergency) or MM (military) preference ratings. As an example, they said that orders from Army-Navy hospitals, which bear MM ratings, will take preference over orders from civilian hospitals.

Production of penicillin has increased steadily. The 1945 estimated production, in excess of 8,500,000,000 units, is more than five times the 1944 production of 1,633,000,000 units. Present capacity of the industry, which began commercial manufacturing during the war, is around 800,000,000 units a month, and the prospect is that processing improvements will raise this figure.

Although production did not reach capacity in the summer and early fall, it is now increasing, as these figures show:

Third Quarter Actual Production, 1945		Fourth Quarter Estimated Production, 1945	
July	688,980,000,000 units	October	612,470,000,000 units
August	636,510,000,000 units	November ..	657,960,000,000 units
September ..	586,370,000,000 units	December ...	698,100,000,000 units

Both the quality and the potency of penicillin have risen. Originally, 100 units per milligram was acceptable for clinical use, but the average potency today ranges from 500 to 800 units per milligram. Eighteen months is now the effective life of a unit, compared with a three months life at the beginning of commercial production.

The Prime Minister and the Medical Profession

At the Harveian commemoration dinner of the Royal College of Physicians the Prime Minister, Mr. Attlee, in proposing the toast of the college, remarked that Lord Moran, the president, had rendered a special service during the war years when the war cabinet was often anxious about Mr. Churchill because of his vigorous traveling habits. It was always a comfort to them to know that in those expeditions he was in the care of Lord Moran. In regard to the government's proposals for a national health service Mr. Attlee regretted that he was not able to announce them at present, but whatever might be the difficulties of agreeing on the practical means for attaining the ends, the ends themselves were, he believed, approved by the whole country. What the government sought was a service which would be comprehensive in the double sense of being available to every member of the population and of covering every form of medical activity. No patient would be without the treatment he needed through lack of money or lack of organization to provide the necessary facilities. A service is needed in which professional men and women are able to devote themselves to their great calling without financial anxiety and without any feeling of being restricted and overcontrolled by regulations. We need great improvement in our hospital service, in the facilities for diagnosis and treatment outside hospitals, in the number and distribution of medical men, both consultants and general practitioners, and perhaps above all in the planning and organization of the different branches into an integrated whole. The task is not easy but is going to be done. Above all it is realized that for a plan to be successful it must have the help and cooperation of the profession itself. Mr. Attlee believes that the profession is as eager as the government to have a really good service.

A Battlefield Inquest

That valuable publication, the *Army Medical Department Bulletin*, which was issued by the War Office during the war to keep alive a sense of unity and interest among medical officers who received their journals irregularly and after long delays, has reached its final issue. Among the half dozen brief but full and well documented articles is one entitled "Battlefield Inquest." We have had, as shown in previous letters to THE JOURNAL, reports showing the great saving of lives by the new forward surgery. But little was known of the men who died on the battlefield so soon after being picked up that the medical services had no chance of doing anything for them. When the last battle began in Italy an enterprising expedition made its way forward to answer this question by making necropsies before the dead were removed from the battlefield for burial. Twenty-three examinations were made on men found dead on the field and 10 on others who died before operation. The prospects of recovery were assessed as none in 17 of the 33 cases, slight in 9, fair in 4 and good in 3. Four examples will give an idea of the standards applied: Case 1: An open wound into the lung with pneumothorax and hemothorax; brachial artery also divided; prospects of recovery slight. Case 2: Divided femoral artery; prospects of recovery good. Case 3: Two perforations of the jejunum, with 2 to 3 feet prolapsed; two perforations of the stomach and two of the colon; the peritoneum held 1,400 cc. of blood; man survived four and one-half hours; prospects of recovery fair. Case 4: Anterior wall of the heart shot away; prospects of recovery none.

Of the immediate causes of death, hemorrhage was the most important. In 14 of the 33 cases it was the essential factor and in 6 others was second in importance. Of 3 cases regarded as presenting a good chance of recovery, 2 deaths were from hemorrhage and 1 from gas gangrene. Recent work shows that loss of blood is often much in excess of what is supposed and is usually the important factor in deaths attributed to "shock." In extensive or multiple limb wounds loss of blood is often greater than in penetrating wounds of the chest or abdomen. In 13 head wounds nothing was found to call for revision of the present evacuation policy by which a man arrives at a neurologic unit within twenty-four hours of injury. Few men wounded in battle die who might have been saved.

Improved Pay and Conditions of Service for Nurses

The minister of health has stated that the shortage of nurses has reached a critical stage. Wards in general hospitals, sanatoriums and mental institutions all over the country have been closed because of the shortage of nursing staff. Accordingly a new code of higher salaries has been set up in the hope that the shortage of 33,000 can be met in a comparatively short time. The salaries of nurses will be increased by \$200 to \$300 a year. A trained staff nurse will begin at \$600 and ultimately earn \$900 a year. In all cases board and lodging and other emoluments are provided in addition. The ministry of health has also issued a booklet, "Staffing the Hospitals," which increases the attractions to the profession, providing a code which will operate as soon as circumstances permit. Training is to be planned so that nurses have adequate time for study, four weeks paid holiday a year in addition to sick leave and representative councils and a national joint council to safeguard conditions.

The Reorganization of Public Health Services

Dr. Billoux, minister of public health, reported in September the results of a year's work. The conditions left by the Germans were deplorable. One of the problems was to provide the country with drugs and medical supplies. Of 12,000 pharmacies, 1,326 were damaged and 317 were closed. A number of laboratories and pharmaceutical concerns were damaged. The prevention of epidemics—a great danger because of the repatriation of some 2,000,000 people—was another problem. This danger was overcome, for in June and July 1945 only 190 cases of typhus were reported. Other problems were the organization of centers for undernourished children and the establishment of resorts in France and Germany where French children could spend their holidays; the systematic control of the repatriated, and x-ray examination for the prevention of tuberculosis, which has increased alarmingly.

Blocks of hospitals comprising about 50,000 beds were bought from the Allies for the use of civilians. This was accomplished with the scanty means at the disposal of the minister of public health. Prevention is to be the main concern for the time being. To attain this the minister has in view the reorganization of the local and central services of public health. There will be eight central sections in the Ministry of Public Health: 1. General medicine, which will prepare and control laws concerning the practice of medicine and related professions, the training of nurses and social workers and the sanitary supervision of dwellings. 2. Public medicine for the prevention of epidemics and to provide for sanitary measures in general and rural hygiene in particular. 3. Social medicine, which will organize campaigns against tuberculosis, cancer and rheumatic fever and will promote mental hygiene. 4. A pharmaceutical

section. 5. A section for the protection of maternity, infancy and adolescence. This section will also care for homeless children and delinquent children. 6. A section of mutual help (*Entr'aide sociale*), which will take care of hospital services, the organization of convalescent homes for workers and the coordination of all private and public organizations of assistance. 7. A section for the family, which will maintain the necessary contact with all associations dealing with problems of the family. 8. A temporary section, concerned with matters pertaining to the health of the repatriated and the sanitary measures for damaged regions.

Local services of the Ministry of Public Health will be reorganized. The services will be decentralized: The regional directions will be suppressed and redistributed on a district basis (*base départementale*). A permanent contact between the central and the district services will be established.

Alcoholism

In the *Semaine des hôpitaux* Derobert publishes the following statistics of the decrease of psychiatric diseases due to alcohol:

Years	Hospitalization for Alcoholism	Years	Hospitalization for Alcoholism
1936.....	3,916	1940.....	2,562
1937.....	3,352	1941.....	2,162
1938.....	3,590	1942.....	796
1939.....	3,493	1943.....	626

The same tendency was found at St. Antoine's Hospital, psychiatric ward, for the year 1944:

Years	Total Number of Patients	Admission for Alcoholism
1941.....	442	111
1944.....	239	16

In a preceding letter, attention was called to the decrease of visceral alcoholism and, above all, of hepatic cirrhosis in Paris. A study covering all France, published by the General Institute of Hygiene, has confirmed this fact. In 1941 the persistence of inebriety due to the consumption of wine was found only in the districts of Lyons and Montpellier, both of which are conspicuous for their production of wine.

Another agent favoring inebriety in those districts was the underfeeding from which the inhabitants suffered, together with a concomitant and persisting ingestion of alcohol, which produced speedy hepatic alterations.

The part of wine, as a cause of alcoholism, is emphasized in an inquiry made by P. Perin among 460 physicians in forty-eight districts, recently published in the book "Crusade Against Alcoholism"; 206 physicians charge wine with being the only cause of alcoholism.

Simplified Method of Aschheim-Zondek's Test of Pregnancy

At a meeting of the Society of Endocrinology, Aschheim described a simplified method of the classic Aschheim-Zondek test for pregnancy. The technic is as follows: A single subcutaneous injection of 0.5 cc. of the urine to be examined is made in 2 female rats which have not yet attained puberty. These rats should be 4 to 5 weeks old and weigh 22 to 35 Gm. In seventy-two, eighty-four and ninety-six hours after this injection, vaginal smears of the 2 rats are taken. After sixty-six to seventy-two hours epithelial cells without leukocytes are found. After eighty-four to ninety-six hours keratinous cells appear; these keratinous cells constitute the test of pregnancy. It is unnecessary to kill the animals, as done in the classic pregnancy test, and they can be used for further experiments. Using this method, the author has examined urine of 39 pregnant women, 30 nonpregnant women and 1 of a man with testicular teratoma; the results compared with other pregnancy tests were satisfactory. Up to now the earliest examination has been made forty-one days from the beginning of the last menses. The new

method is simple and economical. Aschheim remarked that this simplified method requires ten minutes to perform as against thirty minutes for the classic method and fifty minutes for the Friedmann-Brouha test on rabbits, which requires the services of two persons.

MOSCOW

(From a Special Correspondent)

Nov. 13, 1945.

Medical Sequelae of War

Dr. Semashko believes that it is important for medical workers and the various departments of public health to study the effects on the Soviet Union of the war just ended. A study of this sort will in all probability explain the fact that Russia has escaped epidemics of disease despite the mass movements of population from fascist occupied regions, despite poor nutrition and lack of housing and fuel. The Soviet Union has been able to prevent epidemics because of the services of the state health organizations. Every citizen has available to him free medical aid in dispensaries, outpatient departments, hospitals, sanatoriums and other medical institutions. Dr. Semashko emphasizes the necessity of uniform planning and action by various organizations and institutions in combating epidemics. Uniformity of planning makes for economy of forces and expenditures. Preventing disease plays an important part in Soviet health services. Adherence to this principle played an important part in wartime in preventing epidemics. Great difficulty was experienced in maintaining cleanliness of inhabited areas on account of shortage of workers and transport. The people themselves in the towns kept their dwellings and cities clean. In heroic Leningrad the streets were kept as clean during the siege as they were in peacetime, thanks to the efforts of the inhabitants. Flaring up of epidemic diseases occurred in certain districts, but they were rapidly eliminated by adoption of quarantine measures. Despite the horrible damage wrought by the fascists in the Ukraine, shortly after the expulsion of the Germans a network of medical institutions was rebuilt so that by January 1945 the number of such institutions was almost up to the prewar level.

Silber's Studies in Immunology

Professor L. A. Silber has devoted twenty-five years of investigation to the subjects of immunity, ultraviruses and malignant tumors. He has written a number of papers on symbiosis of bacteria and viruses. In his work on cancer he was able to separate a virus-like agent. Extracts of newly formed neoplasms, he reported, were capable of converting normal cells into malignant cells. After many years of study on the different forms of encephalitis Silber established in 1944 the existence in Russia of the Scotch encephalomyelitis. Silber's work has been effective in organizing the study of ultraviruses. Because of his initiative and energy, the Council of Peoples Commissars of the Soviet Union set up in 1935 a central virus laboratory which now forms part of the Institute of Experimental Medicine. The plague vaccine produced by Silber proved to be ten times more effective than any of the vaccines produced from dead bacteria. Silber was first to discover that certain ultraviruses, smallpox virus for example, can exist in the yeast in which they have been placed experimentally or in which they are found naturally under conditions that would kill them outside the yeast. This discovery led to a completely new idea as to the manner in which viruses exist in nature. The discovery of tick borne encephalitis in the Soviet Union was likewise made by Silber. He studied the epidemiology of this infection, then new to science, under difficult field conditions in distant Taiga and demonstrated that the disease is transmitted by ticks. He and his associates isolated an ultravirus which causes tick borne encephalitis. This work is a milestone in Soviet virology.

SÃO PAULO, Oct. 15, 1945.

The Santonin Test for Liver Function

Dr. Luis C. Fonseca, associate professor of medicine at the University of São Paulo, has published an important paper in which he reviews the question of the santonin test for the examination of the antitoxic function of the liver and presents the results of an experimental study in "normal" men. The complete paper includes the chemical study of santonin, the physiologic problem of the antitoxic function of the liver, the foundation and technic of the test, the preparation of the colorimetric scale and the physiopathology of the test. Dr. Fonseca describes the use of the test on 50 "normal" persons, the laboratory assay of the results in comparison with the results of other tests and a general discussion of the findings. Dr. Fonseca believes, as several other authors do, that the santonin test has been too hastily evaluated as a good device for ascertaining the antitoxic function of the liver.

Dr. Fonseca decided to use 50 nondiseased robust young persons in whom he carefully studied the elimination curve of the oxysantonin. He performed the test with three different techniques: with free ingestion of liquids (the original procedure proposed by Moukhtar and Djévat), by giving 100 cc. of water every hour and finally by completing the volume of eliminated urine to 100 cc. if the volume was less than 100 cc. or to 150 cc. if the volume was more than 100 but less than 150 cc. The plotting of two or three curves of elimination for each of the 50 persons studied clearly demonstrated that the degree of the colorimetric scale varies inversely with the dilution of the oxysantonin, thus showing the importance of the volumetric curve, which is closely related to water metabolism. It is easy to conclude that, whenever this metabolism is disturbed, even without the participation of the liver, false results may be obtained with the santonin test. In patients with cirrhosis, particularly the acitogenous cirrhosis, there is a disturbance of water balance. A determination of the antitoxic function of the liver is naturally indicated for a diagnostic and prognostic objective. Dr. Fonseca stresses that this is a paradoxical situation since the conditions present should be considered contraindications to the use of the test. In cases of jaundice with elimination of large amounts of biliary pigments which give a deep color to the urine, the intensely red results of the test are of difficult colorimetric classification. The careful study of the 123 curves obtained by the use of the various techniques enables the author to conclude that the elimination greatly varies with the particular technic used.

Hospital News

A new army hospital has been erected at Porto Alegre, state of Rio Grande do Sul. The building is a five story monobloc of reinforced concrete, provided with all the modern facilities, including air conditioning and heating. It cost about a million United States dollars. There are 600 beds distributed in an area of 6,000 square meters (6,562 square yards). The new hospital is under the direction of Lieut. Col. Ismar T. Mntel.

The "Centro de Clinicas do Districto Federal" (Clinical Center of the Federal District) will build a large general hospital in the city of Rio de Janeiro.

The Brazilian Institute of Cancer has decided to build a specialized cancer hospital in the city of Rio de Janeiro. The laying of the cornerstone was an imposing ceremony attended by Dr. Dollinger da Graca, president of the institute, who delivered a speech in which he pointed out the importance of the problem of cancer in Rio de Janeiro and described the main features of the hospital and its services.

A radium and x-ray division has been inaugurated at the Eiras Hospital of Rio de Janeiro under the direction of Dr. Jorge Jabour. Drs. Edgar Drolhe, Ernani Bueno and Pena de Azevedo are in charge respectively of the x-ray, the radium and the pathology services of the division.

The Nossa Senhora das Dores Hospital of Rio de Janeiro has recently inaugurated a radium service, provided with 50 centigramms of radium, acquired in the United States at the cost of \$21,000. The hospital is under the direction of Dr. Ary Almeida Silva.

The Rio de Janeiro City administration has appropriated a sum corresponding to \$50,000 to improve the São Sebastião Hospital for acute contagious diseases and for similar purposes in the Torres Homem Tuberculosis Hospital.

South American Meeting of Microbiologists and Parasitologists

Dr. Hugo Vaccaro of Chile, Dr. Juan E. Mackinnon of Uruguay and Dr. Carlos S. Lacaz of São Paulo have decided to promote a meeting of South American specialists in microbiology, parasitology and tropical pathology. Among the most important subjects to be discussed at the meeting are American trypanosomiasis, schistosomiasis, jungle yellow fever and South American shigelloses, rickettsioses and blastomycoses. The University of Chile, the Catholic University of Santiago, the Concepción University and the São Paulo Bacteriologic Institute, the Institute of Veterinary Investigations and the São Paulo State Department of Health have already decided to send representatives to the meeting. Drs. Battistini, Herccelles and Colchon from Lima, Peru, Dr. Wandenberg of Quito, Ecuador, Drs. Navarez and Rodrigues from Guayaquil, Dr. Iragorri from Caracas and Drs. Bonilla and Patiño Camargo from Bogotá have promised to take part in the meeting. An organizing committee has been formed, which includes Drs. Juan Noé, Julio San Miguel, Hugo Vaccaro and Carlos Garcez.

The Walter Reed Medal Awarded to the Brazilian Government

The American Society of Tropical Medicine has awarded the Walter Reed Medal to the Brazilian federal government in recognition of the "invaluable work" accomplished by that government in the sphere of preventive medicine. The society likewise awarded a diploma to Hon. Gustavo Capanema, minister of health of Brazil. In forwarding the medal to the Brazilian Department of State, Mr. Carlos Martins, Brazilian ambassador in Washington, pointed out that the award had a special significance for Brazil and its minister of health, since this was a distinction awarded thus far only to the Rockefeller Foundation (1936), to Dr. William B. Castle (1939), to Dr. Herbert C. Clark (1940), and to Dr. Carlos J. Finlay (1942). Minister Capanema presented the medal to the National Museum of History of Rio de Janeiro.

Marriages

ROBERT NORMAN BUCHANAN JR., Hendersonville, Tenn., to Miss Rachel Blackman of Wartrace, in Nashville, September 15.

ROBERT C. POLSON, Lawrence, Kan., to Miss Marjorie Simonson in Santa Barbara, Calif., September 15.

CARLETON DOUGLAS ROWLEY, Walton, N. Y., to Miss Mary Elizabeth Patti of Batavia, September 28.

FORREST J. PINKERTON to Mrs. Florence Helmick Macaulay, both of Honolulu, Hawaii, September 14.

HARRY KIRBY SHIFLER to Miss LuVern Gray, both of Des Moines, August 22.

Deaths

Joseph McFarland ☉ Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1889; born in Philadelphia, Feb. 9, 1868; since 1936 emeritus professor of pathology at his alma mater and since 1940 professor of general pathology at the school of dentistry at Temple University; served as professor of pathology at the Woman's Medical College of Pennsylvania, Evans Dental Institute and the Veterinary Medical School of the University of Pennsylvania; professor of pathology and bacteriology at the Medico-Chirurgical College from 1896 to 1916; secretary of the Section on Pathology and Physiology of the American Medical Association from 1901 to 1903 and chairman, 1903-1904 and member of the House of Delegates in 1905 and in 1906; organizer and director of the Mulford Biological Laboratory from 1894 to 1900; fellow of the American College of Physicians, College of Physicians of Philadelphia, Academy of Natural Science and the Philadelphia Academy of Stomatology; member of the American Association of Pathologists and Bacteriologists; associate member of the American Society of Clinical Pathologists; major in the medical corps of the U. S. Army during World War I, serving as chief of the laboratory service at Base Hospital, Camp Beauregard, Alexandria, La., at General Hospital number 9, Lakewood, N. J., General Hospital number 14, Fort Oglethorpe, Ga., and director of laboratory instruction in the Medical Officers Training Corps at Camp Greenleaf; consulting pathologist at the Philadelphia General Hospital, Doctors Hospital and the American Oncologic Hospital; author of nine editions of "Pathogenic Bacteria and Protozoa," two editions of "Text-Book of Pathology," five editions of "Biology: General and Medical," "Fighting Foes Too Small to See" and "Surgical Pathology"; co-author of "The Breast"; in 1942 was presented with the 1941 Strittmatter Award of the Philadelphia County Medical Society; died September 22, aged 77, of coronary thrombosis.

Ellsworth Eliot Jr., New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1887; born in New York June 6, 1864; member and past president of the American Surgical Association and the New York Surgical Society; member of the American Medical Association and the Society of Clinical Surgery; served as chairman of the surgical section of the New York Academy of Medicine; a major in the medical corps of the U. S. Army during World War I, serving at Chateau-Thierry, St. Mihiel and the Argonne; for two months, after the armistice, was director of surgery for the American Expeditionary Forces evacuation hospital in France; formerly professor of clinical surgery at his alma mater, where he gave a popular course to medical students known as "Eliot's Quiz"; served as professor of clinical surgery at Cornell University; director of surgery at the Knickerbocker Hospital from 1929 to 1937 and chief of surgery at the Vanderbilt Clinic from 1895 to 1900; author of "Yale in the Civil War"; served on the staffs of Gouverneur Hospital, Northeastern Dispensary, Lawrence Hospital, Bronxville, White Plains (N. Y.) Hospital and the Presbyterian Hospital, where he died November 2, aged 81.

Benjamin Austin Cheney ☉ New Haven, Conn.; Yale University School of Medicine, New Haven, 1890; born in Joliet, Ill., June 10, 1867; past president of the New Haven County Medical Society and the New Haven City Medical Society; member of the Connecticut Academy of Arts and Sciences; fellow of the American College of Surgeons; formerly assistant in obstetrics and gynecology, instructor in obstetrics and gynecology and assistant professor of obstetrics and diseases of women and children at his alma mater; at one time owner of a hospital bearing his name; consulting surgeon, Griffin Hospital, Derby; consulting surgeon and member of the board of governors at the Charlotte Hungerford Hospital, Torrington; member of the medical advisory board of the Neuro-Psychiatric Institute of the Hartford Retreat in Hartford; one of the founders of the Grace Hospital, where he had been chairman of the board until early in 1945, when he became honorary chairman following the merger of the Grace and New Haven hospitals; died in the Grace Hospital October 10, aged 78, of coronary occlusion.

Edward O. Morrow ☉ Canton, Ohio; Starling Medical College, Columbus, 1887; past president of the Stark County Medical Society; a member of the staffs of the Mercy and Aultman hospitals; laid the cornerstone in the winter of 1943 for the new wing to Aultman Hospital as the only surviving physician who had served on the first staff in 1937; when he completed fifty years in the practice of medicine, was honored

by the Canton Medical Library Association, of which he was one of the founders; died August 26, aged 80, of coronary sclerosis.

Wilbur Ogden Arnold ☉ West Palm Beach, Fla.; Emory University School of Medicine, Atlanta, 1923; past president of the Palm Beach County Medical Society; served during World War I; on the staffs of the Good Samaritan and St. Mary's hospitals; died August 23, aged 47.

James Meade Atkinson Jr. ☉ Port Huron, Mich.; University of Michigan Medical School, Ann Arbor, 1930; interned at the Mercy Hospital in Jackson; formerly chief resident at the Woman's Hospital in Detroit; died July 24, aged 47.

John Andrew Belch, Syracuse, N. Y.; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1889; formerly on the staff of the Crouse-Irving Hospital; on the staff of the Onondaga General Hospital where he died August 18, aged 82, of general arteriosclerosis.

Howard Spencer Brasted ☉ Hornell, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1914; vice president of the Seventh District Branch of the Medical Society of the State of New York; fellow of the American College of Physicians; on the staffs of the Bethesda Hospital and the St. James Mercy Hospital, where he died August 28, aged 57, of coronary thrombosis.

George A. Clark, Wilkes-Barre, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1885; member of the American Medical Association; served two terms as city physician; died in the Wilkes-Barre General Hospital August 6, aged 83, of carcinoma of the stomach and acute dilatation of the heart.

John Hession Conway ☉ Cheyenne, Wyo.; Bellevue Hospital Medical College, New York, 1892; served as city health officer and county physician; for many years affiliated with St. John's Hospital and the Memorial Hospital of Laramie County; at one time vice president of the Citizens National Bank of Cheyenne; died August 10, aged 74, of coronary thrombosis.

Harrison Taylor Cronk, New York; Bellevue Hospital Medical College, New York, 1894; served during World War I; died in the Bellevue Hospital August 17, aged 74, of aortic aneurysm.

James Michael Dinnen, Fort Wayne, Ind.; Rush Medical College, Chicago, 1879; member of the House of Delegates of the American Medical Association in 1913 and 1914; for many years chief surgeon for the Nickel Plate Railroad; died August 14, aged 88, of cerebral hemorrhage.

John William Dunn, Safety Harbor, Fla.; St. Louis University School of Medicine, 1905; served during World War I; formerly on the staff of the Lincoln State School and Colony in Lincoln, Ill.; died in the Veterans Administration Facility, Oteen, N. C., August 23, aged 63, of pulmonary tuberculosis.

James Weatherwax Graves, Herkimer, N. Y.; University of Vermont College of Medicine, Burlington, 1908; past president of the Herkimer Academy of Medicine; county coroner and health officer; served during World War I; on the staffs of the Herkimer Memorial Hospital in Herkimer and the Paxton Hospital in Utica; found dead August 23, aged 61, of coronary thrombosis.

Edward Thomas Wade Hall ☉ Weston, W. Va.; University of Maryland School of Medicine, Baltimore, 1885; honorary member of the West Virginia State Medical Association; captain in the medical corps of the U. S. Army during World War I; founded Hall's Hospital at Freemansburg; co-founder of the Weston City Hospital; died October 7, aged 81, of uremia.

James Foster Hasbrouck, Pasadena, Calif.; Columbia University College of Physicians and Surgeons, New York, 1894; also a dentist; formerly professor of exodontia at the New York University Dental School and visiting oral surgeon at the Bellevue Hospital, both in New York; served as trustee of the village of Larchmont, N. Y.; died October 13, aged 75, of heart disease.

Philip Tucker Hodgskin, Rockville Centre, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1927; diplomate of the National Board of Medical Examiners; member of the American Medical Association; died in Lincoln, Neb., July 18, aged 43.

Lawrence Nicholas Host ☉ Detroit; Marquette University School of Medicine, Milwaukee, 1915; served in the medical corps of the U. S. Army during World War I; on the staffs of St. Joseph's Mercy and the Deaconess Evangelical hospitals; died August 23, aged 53, of coronary thrombosis.

Alexander William Jacobs, New York; Columbia University College of Physicians and Surgeons, New York, 1915; specialist certified by the American Board of Radiology, Inc.; member of the American College of Radiology; served in the medical corps of the U. S. Army during World War I; at one time assistant physician at the New York City Cancer Institute; on the staffs of the Sydenham and Lebanon hospitals; died in the Mount Sinai Hospital August 8, aged 52, of leukemia.

Douglas P. A. Jacoby * Newport, R. I.; Starling Medical College, Columbus, 1894; member of the American Academy of Ophthalmology and Otolaryngology; retired from the Rhode Island State Guard as a brigadier general after having served for several years as a colonel in the Newport Artillery Company, which he was instrumental in reorganizing; chief of the eye, ear, nose and throat department of the Newport Hospital, where he had been president of the board of trustees; died August 25, aged 72, of coronary thrombosis.

Joseph J. Jonikaitis * Detroit; Loyola University School of Medicine, Chicago, 1916; on the staff of the Lincoln Hospital; died July 20, aged 60, of heart disease.

Ferdinand Michael Jordan * Rochester, Minn.; University of Pennsylvania School of Medicine, Philadelphia, 1925; a fellow in medicine at the Mayo Foundation from 1926 to 1931; member of the Medical Society of the State of New

Fred Covington Jordan, Phoenix, Ariz.; Drake University College of Medicine, Des Moines, 1908; member of the American Medical Association; died July 29, aged 61, of coronary occlusion.

William Frank Long, Sulphur Springs, Texas; University of Tennessee College of Medicine, Memphis, 1915; member of the American Medical Association; city and county health officer; died August 12, aged 52, of virus pneumonia.

Frank Sheridan Lott * Bexley, Ohio; Ohio Medical University, Columbus, 1901; founder and for many years chief of staff of St. Clair Hospital, Columbus; formerly surgeon for the Columbus division of the Pennsylvania Railroad; died July 31, aged 81, of heart disease.

Jonathan Tambllyn Male, Yampa, Colo.; University of Buffalo School of Medicine, 1898; member of the American Medical Association; for many years a druggist; died in the Colorado General Hospital, Denver, July 15, aged 76, of post-operative shock following amputation of the right leg.

Joseph Denegre Martin, New Iberia, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1903; member of the American Medical Association; specialist certified by the American Board of Otolaryngology; served on the faculty of his alma mater and on the staffs of the Southern

CAPT. WALTER F. H. BARTZ

CAPT. NEIL MAYNARD BURR
M. C., A. U. S., 1915-1944

LIEUT. (JG) THEODORE R. CURBY
(MC), U.S.N., 1919-1945

York; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; member of the National Gastroenterological Association; served on the staff of the Grasslands Hospital in Valhalla, N. Y.; died August 14, aged 43, of uremia and polycystic kidneys.

Pacific Hospital and Touro Infirmary, New Orleans, where he died July 6, aged 66.

Duncan McLean, Sacramento, Calif.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1891; died August 13, aged 88.

KILLED IN ACTION

Walter Frederick Henry Bartz, Youngstown, Ohio; Ohio State University College of Medicine, Columbus, 1939; interned at the Youngstown Hospital; began active duty in the medical reserve corps of the U. S. Army as a first lieutenant on May 5, 1941; promoted to captain on Dec. 24, 1941 of the medical corps, Army of the United States; taken a prisoner when Corregidor fell in 1942; died in the South China Sea Oct. 24, 1944, aged 30, while on board a Japanese prison ship which was sunk.

Neil Maynard Burr, Guide Rock, Neb.; University of Nebraska College of Medicine, Omaha, 1939; interned at the University of Nebraska Hospital in Omaha and served a residency at the Cleveland Clinic Foundation Hospital in Cleveland; began active duty as a first lieutenant in the medical reserve corps of the U. S. Army on Nov. 5, 1940; promoted to captain in the medical corps, Army of the

United States, on Dec. 31, 1941; trained at Camp Shelby, Miss., with the medical detachment to the 147th Infantry of the 37th division; went to the Philippines in August 1941 and was stationed at Fort McKinley with the 12th medical battalion; captured on Bataan and held prisoner until Sept. 5, 1944; died in the South China Sea Oct. 24, 1944, aged 29, while on board a Japanese prison ship which was sunk.

Theodore Roosevelt Curby, Acting Assistant Surgeon, Lieutenant (jg), U. S. Navy, Houston, Texas; Baylor University College of Medicine, Dallas, Texas, 1944; interned at the Naval Hospital in San Diego; entered the U. S. Navy in March 1944; assigned as medical officer aboard a destroyer in December 1944 and saw combat service in the Iwo Jima and Okinawa campaigns; died in the Asiatic area April 28, aged 26.

Charles Edgar McMehen, Berkley, Mich.; Western University Faculty of Medicine, London, Ont., Canada, 1912; served overseas with the Canadian army during World War I; died in the Harper Hospital, Detroit, July 6, aged 58, of coronary thrombosis.

Arthur George Miller * Hobart, Ind.; Loyola University School of Medicine, Chicago, 1922; served in France during World War I; on the staffs of the Methodist and St. Mary's Mercy hospitals in Gary and the Porter Memorial Hospital in Valparaiso; served as deputy county coroner and health officer of Hobart; died August 2, aged 52, of coronary thrombosis.

William Franklin Simmons, Gilmore, Ark. (licensed in Arkansas in 1903); died August 29, aged 72, of chronic nephritis.

Carroll Smith * St. Louis; Rush Medical College, Chicago, 1904; professor of surgery at St. Louis University School of Medicine; member of the founders group of the American Board of Surgery; fellow of the American College of Surgeons; on the staffs of St. Mary's, St. John's and Alexian Brothers' hospitals; died in University City September 6, aged 67.

Mabel Simis Ulrich, Minneapolis; Johns Hopkins University School of Medicine, Baltimore, 1901; formerly regional director of the American Red Cross for Minnesota, the Dakotas and Montana; member of the state board of health and city board of public welfare; on the editorial staff of the *Journal-Lancet*; died in Otisville, August 12, aged 69, when she accidentally fell from a cliff.

Gordon Fitzhugh West * Camden, N. J.; Jefferson Medical College of Philadelphia, 1919; fellow of the American College of Surgeons; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; president of the Camden County Medical Society; on the staff of the Cooper Hospital, where he died July 26, aged 52, of coronary thrombosis.

Vincent Hugh Williams, Owego, N. Y.; Syracuse University College of Medicine, 1927; interned at the Binghamton City Hospital in Binghamton, where he served a residency; died August 27, aged 43, of auricular fibrillation, chronic cardiac valvular disease and hypertension.

George Lamont Wright, Syracuse, N. Y.; Syracuse University College of Medicine, 1911; member of the American Medical Association; instructor in clinical surgery at his alma mater; served as president of the International Association of

LIEUT. COL. WILLIAM RINEY CRAIG
M. C., U. S. A., 1896-1944

M. C., A. U. S., 1916-1944

CAPT. BILLY TRUE WICKENS
M. C., A. U. S., 1913-1944

Walter John Smith, Columbus, Ohio; Medical College of Ohio, Cincinnati, 1902; served during World War I; chief of the division of communicable diseases, state board of health; died August 16, aged 67.

Fire and Police Surgeons and Medical Directors of Civil Service Commissions; surgeon for the city fire department; associate surgeon of St. Joseph's Hospital; died July 22, aged 59, of cerebral hemorrhage.

KILLED IN ACTION

William Riney Craig * Lieutenant Colonel, M. C., U. S. Army, Washington, D. C.; Vanderbilt University School of Medicine, Nashville, Tenn., 1926; fellow of the American College of Surgeons; received his commission in the U. S. Army in 1926; promoted to the temporary rank of lieutenant colonel on Dec. 19, 1941; from 1926 to 1929 served at the William Beaumont General Hospital in El Paso, Texas; attended the Army Medical School and Field Service School for one year; later stationed at Gorgas Hospital in Panama Canal Zone and Fort Sam Houston General Hospital in Fort Sam Houston; commanding officer of the hospital at Fort Douglas, Utah, before going to the Philippines in January 1941; chief of the surgical service at Sternberg General Hospital in Manila at the time of the Japanese attack on the Philippines; served as executive officer of the 7,000 patient hospital number 2 on Bataan and was a survivor of the Bataan death march and medical officer in charge during the two and a half years he was imprisoned at Cabanatuan;

awarded the Purple Heart posthumously; killed in Subic Bay, Luzon, P. I., Dec. 15, 1944, aged 48, when a Japanese vessel on which he was being transported was bombed and sunk.

Ernest Daniel Wenberg, West De Pere, Wis.; University of Wisconsin Medical School, Madison, 1942; interned at Colorado General Hospital in Denver; began active duty as a first lieutenant in the medical corps, Army of the United States, on Feb. 21, 1944; killed in action in Stalag Dec. 23, 1944, aged 28, while a prisoner of war of Germany.

Billy True Wickens, Strawn, Texas; University of Texas Medical Branch, Galveston, 1940; served a residency at the John Sealy Hospital in Galveston and an internship at the Scott and White Hospital in Temple, Texas; began active duty as a first lieutenant in the medical corps, Army of the United States, on May 30, 1942; promoted to captain; died in the European area Nov. 5, 1944, aged 31, of wounds received in action.

Correspondence

CLAVACIN

To the Editor:—The editorial on clavacin in *THE JOURNAL*, September 22, in which it is suggested that this antibiotic be used in local ringworm infections, is of great interest. I have for some time been using streptothricin (antibiotic from *Actinomyces lavendulae*-Waksman 1942) for mild interdigital epidermophytosis in which the objective symptoms consist only of scaling with or without fissuring, in the following formula:

Streptothricin	5,000 units
Triethanolamine	0.2 cc.
Greaseless base	30.0 cc
(Burroughs Wellcome)	

If the streptothricin ointment is used in the condition indicated, the scaling and fissuring disappears in four or five days and the skin will continue to remain smooth as long as the streptothricin ointment is used. Lapse in the use of the ointment is followed by gradual return of the scaling, thus indicating fungistatic but partial or no fungicidal activity. The nature of this application indicates probable lack of local sensitizing and certainly non-irritating properties and for this reason should be the preferable one for the mild types of interdigital epidermophytosis seen in diabetic patients, in whom irritating as well as sensitizing chemicals are best avoided. The ointment, without streptothricin, is of no value.

SIGMUND S. GREENBAUM, M.D., Philadelphia.

TETANUS IMMUNIZATION

To the Editor:—One of the problems concerning returned servicemen which should be brought to the attention of all civilian physicians is the administration of prophylactic doses of tetanus antitoxin.

I recently saw a discharged veteran who suffered a minor laceration of the thumb in an industrial accident. A physician administered 1,500 units of tetanus antitoxin, which was followed in four days by a moderately severe local and systemic serum reaction, causing a loss of three days' working time in addition to that attributable to the original injury. This patient had seen overseas duty and had received the initial tetanus toxoid immunization and subsequent stimulating doses. At the time of his injury he should have been given 1 cc. of tetanus toxoid. The injection of tetanus antitoxin and the subsequent incapacitating reaction were entirely unnecessary. Tetanus toxoid causes little or no reaction.

The record of tetanus toxoid immunization appears on the service discharge papers which most veterans carry on their person. I believe that overseas duty is invariably evidence of tetanus toxoid immunization. In any case, a man should be questioned concerning tetanus toxoid immunization in the service before being given tetanus antitoxin.

ABRAHAM FREEDMAN, Major, M. C., A. U. S.

PAROXYSMAL TEMPORAL HEADACHE

To the Editor:—Referring to Dr. S. B. Nadler's article on "Paroxysmal Temporal Headache" (*THE JOURNAL*, September 29, p. 334), I wish to call attention to my experience with 4 cases during the past year. Each case pre-ented the clinical picture of paroxysmal hemicephalalgia as described by Dr. Nadler, with the major distribution in the temporal area. The pain was dramatically relieved by procaine infiltration of the great occipital nerve at a point corresponding to the point of maximum tenderness in the suboccipital area on the same side. Pain in each case was permanently relieved without any surgical intervention or arterial section.

DAVID A. NEWMAN, M.D., West Palm Beach, Fla.

ROENTGEN'S LABORATORY

To the Editor:—It has occurred to me that it would be a matter of interest to physicians in general, as well as to radiologists in particular, to know something of the present condition of Roentgen's laboratory in Wurzburg, Bavaria. No doubt many have wondered about its fate as I did when I read last April of the push by our armies in that direction toward Nuremberg. The city was bombed and largely reduced to rubble by incendiaries plus high explosives and fought over as well, but fortunately for the mementoes of Roentgen the Physical Institute of the university which houses his laboratory and historical collection escaped with only minor damage such as shattered windows, broken slate and loosened plaster.

I have visited the institute several times this summer and am happy to report that on the hundredth anniversary of Roentgen's birth, and the fiftieth of his great discovery, the scenes of his research, as well as the apparatus he employed, remain undamaged for him who would journey there to see them.

LEWIS E. EITER, Major, M. C., A. U. S.,
115th General Hospital, A. P. O. 758.

CITATION FOR 20TH GENERAL HOSPITAL

To the Editor:—There have been numerous inquiries which I have received about the statement on page 621 of *THE JOURNAL*, October 27, concerning the 20th General Hospital. The statement should have read that the 20th General Hospital was recently commended, the citation being addressed to Brig. Gen. I. S. Raydin from the then commanding general of the India-Burma theater, Lieut. Gen. Dan. I. Sultan: "Under extremely difficult climatic conditions and in an area devoid of practically everything usually considered necessary for the construction and operation of a general hospital, you have built an institution that has been complimented by every one who has visited it. The record of the 20th General Hospital would be outstanding in any theater of operations. Much of this achievement can be attributed to your fine qualities of leadership, but your officers, including your nurses and all of your men, have shown a devotion to duty which is worthy of the highest praise."

I. S. RAYDIN, M.D., Philadelphia.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in *THE JOURNAL*, Dec. 1, page 980.

POSTGRADUATE CONTINUATION COURSES FOR VETERAN AND CIVILIAN PHYSICIANS

Compiled by the Council on Medical Education and Hospitals for Period Jan. 1, 1946 to July 15, 1946

Medical schools, hospitals, state medical societies and other medical educational institutions and organizations are providing the Council with a growing body of information on courses designed primarily to meet the needs of returning medical officers. These have been incorporated into the lists on these pages. They are not specifically designated for veterans, since most if not all of them may also be open to interested civilian physicians. Furthermore, all courses listed which were not designed primarily for physician veterans are also open to qualified returning medical officers.

MEDICOLEGAL ABSTRACTS

Malpractice: Failure to Order Roentgenogram in Treatment of Fractured Terminal Phalanx of a Finger.—The patient crushed her right ring finger in a folding bed Aug. 30, 1941. The third day thereafter she consulted the physician defendant, who intimated that the finger was broken. The finger was so swollen, however, that he could not apply splints until two days later, when it was still so swollen and "so crooked that he could not manipulate the finger even yet, but he did put splints on it and left it crooked the way it was at that time." On several occasions thereafter the patient asked the physician about an "x-ray picture," but the physician replied that it would not be necessary to have one taken. Apparently the patient saw the physician every ten days or two weeks during October and November. The finger remained swollen and crooked. About October 25 the patient on her own volition had a roentgenogram taken by another physician but the defendant, although he knew that the roentgenogram had been taken, did not ask to examine it. Just what that roentgenogram showed is not made clear. About November 25, after the patient, according to her testimony, had "told" the physician "what the x-ray showed," he advised her "to remove the splint for a while and see if it would heal any better without it." The patient then inquired about an operation on the finger "to remove the bone shown" in the roentgenogram, but the physician stated that "it wouldn't do any good to rush an operation." In January the patient again inquired concerning an operation and the physician then advised her to have another roentgenogram taken, apparently admitting at that time that he should have had one taken when he first undertook treatment and that any "fault" in the matter of procuring one was all his own. The roentgenogram taken at that time revealed a "fracture of the base of the terminal phalanx, whose shaft . . . [was] markedly displaced." After examining the roentgenogram the physician concluded that because of the lapse of time it would then do no good to operate and referred the patient to an orthopedic specialist, who examined and taped the finger. A few days later the patient removed the tape because of discomfort and when she told the physician defendant this fact apparently the defendant withdrew from the case. A bad result eventuated and the patient subsequently sued the defendant, alleging that the bad result was due to his negligent diagnosis and treatment, attributed to his failure to have a roentgenogram made earlier in the course of his treatment. The trial court entered a judgment of nonsuit, and the patient appealed to the Supreme Court of California.

In considering, said the Supreme Court, whether the judgment of nonsuit in this case was proper, we must resolve every conflict in the evidence adduced in favor of the patient and we must consider every inference which can reasonably be drawn and every presumption which can fairly be deemed to arise in support of the plaintiff, and accept as true all evidence, either direct or indirect, which tends to sustain the plaintiff's case. The only direct expert testimony adduced at the trial was that of the physician defendant. So far as is here material, he testified that in the case of a fracture of the phalanx a splint should be applied "in the position in which healing is most apt to occur" and that was exactly what he did in treating the patient. When he applied the splint, he stated,

"to the extent of clinically treating a fracture of that phalanx I knew that there was a chip off the posterior surface of the phalanx. . . . Any x-ray that might have been taken on September 2 would merely have been a confirmation of my clinical judgment regarding that fracture. . . . At the time this finger was splinted it was still slightly swollen and inflamed from the crushing force of her injury. The finger was brought up in as full extension as possible, and that is all that anybody can do to reduce that type of fracture. There is no such thing as setting the fracture. What you have to do is to set the main bone as closely as possible to the place that is fractured off," and that was done in this case.

The defendant apparently contended that there was a latent arthritic condition present in the patient while he undertook treatment. Such a condition, he stated, tends to retard healing

and calls for additional care on the part of the physician. While he made no laboratory tests for arthritis he depended on his senses, his sight and his sense of touch. While he believed that the patient had a latent tendency toward the development of arthritis there was no acute arthritis present. However, he believed, even if acute arthritis had been present, no material difference could have been made in the treatment, which, in any event, would still be to splint the finger and keep it immobilized in a condition in which healing would be most likely to take place, which is full extension. The physician knew, he testified, that the finger had to be splinted in full extension and while taking a roentgenogram would perhaps have added some slight confirmation to what he did it would not have changed what he did in the slightest, nor would it have changed the eventual result. About four weeks after he first treated the injury, he further testified, at a time just before the plaintiff of her own volition had had the first roentgenogram taken, he realized that the injury was a little slow in healing but he fully expected the fracture to heal and for the patient to have a good result. Even by that time, he stated, it was extremely doubtful to him whether or not the arthritis would have shown definitely in any roentgenogram that might have been taken. Defendant further testified that of eight physicians in general practice in the community in which he practiced, seven had told him that it was their custom to treat such fractures without invariably demanding a roentgenogram.

As indicating the general rule of law that governs in malpractice actions, the Supreme Court quoted from *Engelking v. Carlson* (1939), 13 Cal. (2d) 216, 88 P. (2d) 695:

The law has never held a physician or surgeon liable for every untoward result which may occur in medical practice. It requires only that he shall have the degree of learning and skill ordinarily possessed by physicians of good standing practicing in the same locality and that he shall exercise of good standing practicing in the same locality and that he shall exercise ordinary care and diligence in applying that learning and skill to the use of ordinary care and diligence in applying that learning and skill to the treatment of his patient. [Citation.] Whether he has done so in a particular case is a question for experts and can be established only by their testimony. [Citations.] . . . Negligence on the part of a physician or surgeon will not be presumed; it must be affirmatively proved. . . . It is true that in a restricted class of cases the courts have applied the doctrine of *res ipsa loquitur* in malpractice cases. But it has only been invoked where a layman is able to say as a matter of common knowledge and observation that the consequences of professional treatment were not such as ordinarily would have followed if due care had been exercised.

The court further quoted from *Bickford v. Lawson* (1938), 27 Cal. App. (2d) 416, 81 P. (2d) 216, as follows:

The necessity of employing an x-ray apparatus in reducing a fractured limb depends entirely upon the circumstances of the particular case. The question as to whether the reduction and treatment of a fractured limb without the use of an x-ray machine constitutes negligence depends upon what an ordinarily skilled physician practicing in that vicinity, in the exercise of due care and professional judgment, would be required to do under like circumstances. The determination of those questions depends upon expert testimony.

The expert testimony, continued the court, to establish a plaintiff's prima facie case in a malpractice action may be that of a defendant. *Lawless v. Calaway* (1944), 24 Cal. (2d) 81, 147 P. (2d) 604; *Anderson v. Stump* (1941), 42 Cal. App. (2d) 761, 109 P. (2d) 1027. We can presume that the defendant in testifying will state his case as favorably to himself as possible. Furthermore, extrajudicial admissions of a physician defendant to have the same legal competency as direct expert testimony to establish the critical averments of the complaint. While it is true that an extrajudicial statement amounting to no more than an admission of bona fide mistake of judgment or untoward result of treatment is not alone sufficient to permit the inference of breach of duty, such an extrajudicial statement may be binding on the physician if it is an admission of negligence or lack of the skill ordinarily required for the performance of the work undertaken. But in reviewing a judgment of nonsuit, where the physician defendant's statements or inferences drawn therefrom conflict, the conflict must be resolved in favor of the patient. In other words, under such circumstances where the statements are reasonably susceptible to more than one meaning, the meaning to be placed on them is that meaning which is favorable to the plaintiff.

According to testimony adduced on behalf of the patient, the physician defendant stated that he should have had a roentgenogram taken "in the beginning" and that the fault in that respect was all his own. The jury would have a right to believe that

the defendant, as a physician, was using the word "should" to import the duty which he, as a physician practicing his profession, owed to his patient in the exercise of ordinary care. As is said in Webster (New Int. Diet., ed. 2):

Ought and should express obligation, *Ought* commonly suggesting duty or moral constraint, *Should*, the obligation of fitness, propriety, expedience and the like

Furthermore, continued the court, coupled with the defendant's statement as to what he should have done "in the beginning" is the admission that failure to have a roentgenogram taken was all his own "fault." The word "fault" in one of its meanings signifies "responsibility for wrongdoing or failure; culpable cause" (Webster's New Int. Diet., ed. 2). See also *Marston v. Pickwick Stages, Inc.* (1926), 78 Cal. App. 526, 248 P. 930. When the physician finally did have a roentgenogram taken it showed a "fracture of the base of the terminal phalanx whose shaft is markedly displaced." It does not require the testimony of an expert witness, under the conditions shown here, to support the conclusion that a piece of bone which is markedly displaced from the larger bone from which it has been detached is not in proper healing position. The roentgenogram ordered by the physician was not ordered and taken until Jan. 2, 1942, and on examining it the physician stated that "he didn't think after this length of time it would do any good to operate on [the finger]." The physician testified that "the condition of the finger was essentially" the same about the first of December as it was after January 2, the time when the roentgenogram was ordered by the physician, but at the earlier date, according to the patient's testimony, the defendant said "it wouldn't do any good to rush an operation." On cross examination the physician admitted that if he had had a roentgenogram taken in the early stages of his treatment he "would have been able to see that the fragment of bone was unting or out of position" and that it would have made him suspicious that something was keeping it from uniting properly. Yet after the time to which such admission related the physician, still without requiring a roentgenogram, removed the splint to "see if it [the finger] would heal any better without it." When the physician originally splinted the finger, according to the plaintiff, he "left it crooked the way it was at that time," although he later admitted on the witness stand that he "knew the finger had to be splinted in full extension." It is true that he also testified that "the finger was brought up in as full extension as possible, and that is all that anybody can do to reduce that type of fracture." But, continued the court, the jury need not have believed that statement. That statement only created a conflict with the inferences to be drawn from the physician's admissions as to what should have been done in the beginning, as to his culpable negligence in not having a roentgenogram taken earlier, and as to his opinion in January 1942 that "he didn't think after this length of time it would do any good to operate." The implication of this latter statement would seem to be that an earlier operation would have benefited the patient and, hence, that the physician was mistaken in his statement that merely splinting the finger "in as full extension as possible . . . is all that anybody can do to reduce that type of fracture." An extrajudicial admission of "fault" may amount to no more than an admission of bona fide mistake or misfortune and thus be insufficient to establish negligence or it may support the inference that the patient was damaged as a proximate result of the physician's negligence.

In this case, continued the court, we are satisfied that a jury, considering the background of all the other evidence, could have reasonably concluded that the admissions of the physician imported that he had not exercised that reasonable degree of skill and learning and care ordinarily exercised by other physicians of good standing practicing in the community and that as a proximate result of that negligence the patient suffered injury. In other words, the admissions of the physician that he "should" have had a roentgenogram taken "in the beginning" and that he was "at fault" in that regard constitute evidence of a character competent to require that the issue of the physician's negligence be decided as a matter of fact by the jury.

For the reasons stated, the judgment of nonsuit entered by the trial court was reversed.—*Lashley v. Koerber, M.D., 156 P. (2d) 441 (Colo., 1945)*

Bureau of Investigation

SOME MISCELLANEOUS MEDICAL FRAUDS

A Variety of Schemes Debarred from the Mails

Fraud orders issued by the Post Office Department have frequently been the subject of extensive articles by the Bureau of Investigation in these pages of THE JOURNAL. Following are abstracts of two such fraud orders:

Graygone Vitamin Company.—This New York concern was one of the various firms advertising vitamin products to restore the original color to hair that has turned gray. The Post Office Department has debarred some such enterprises from the mails on the ground that they constituted frauds on the public. In this case, after a lengthy investigation, the Post Office cited the proprietor and sole owner, Elms A. Kahn, to show cause why similar action should not be taken against his business. Kahn appeared at the hearing held in Washington Oct. 26, 1944, but was not represented by counsel. On that occasion the Post Office Department presented evidence that Kahn and his concern had represented that their "Graygone Vitamin Tablets," when used as directed, would restore the "natural lustre and color" to gray hair, that it would remedy the deficiency which causes hair to turn gray, that "occasional use" of the product as directed would prevent the hair from graying, and that users would obtain results identical with or similar to those described in alleged testimonials included in the advertising. Kahn orally presented a general denial of the charge that these representations and promises were false and fraudulent. The Post Office inspector who had conducted the investigation of the case testified as to the claims made in the concern's literature regarding the ability of its product to restore the original color to gray hair. A medical officer of the Food and Drug Administration also testified for the government, stating that he was familiar with modern scientific teaching and opinion relative to nutrition, and to the use, value and functions of vitamins. He presented evidence that pantothenic acid (which, with calcium, the label of Graygone tablets declared to be present in the product) is one of the vitamins of the B complex, that it has not been proved scientifically to be essential in the diet of humans or to be, through deficiency, the cause of any distinct disease entity. He further showed that pantothenic acid is widely distributed in common foodstuffs ordinarily used by the American public and that there is little likelihood of its being deficient in the normal American human diet. His further testimony was to the effect that the chief cause of gray hair lies in the natural aging processes of the human system with the passing of time, though the condition may also result from severe debilitating diseases, glandular disorders, undernourishment and some other causes. He cited a scientific experiment that he and other physicians had conducted to determine whether pantothenic acid had any value in the restoration of gray hair of human beings to the former natural and youthful color thereof, which tests had shown the contrary. Since the defendant in the case presented no valid contradictory testimony, a fraud order was issued on Jan. 3, 1945, debarring from the mails the Graygone Vitamin Company, also known simply as Graygone, together with one J. T. White, Sales Manager, and the officers and agents.

Victor Press.—Under this name a William J. Dubler, M.D., sold through the mails from Camden, N. J., an alleged treatment called the "Natural Health Method," which was publicized through a book called "Are Appendicitis Operations Necessary?" This represented that Dubler had "developed a new and revolutionary treatment for appendicitis, after nearly fifty years devoted to practice, study and research"; that the Method, "when used as directed, will cure acute and chronic appendicitis and abscess of the appendix, without the use of drugs, operations or freezing, that the treatment was 'a safe, certain, prompt and permanent cure for all cases, kinds and complications of appendicitis,' and that persons suffering from this condition, whether acute or chronic, could cure themselves by self treatment after reading the book five times. Dubler was graduated from Baltimore University School of Medicine in 1898, and in 1899 obtained a license to practice medicine in New Jersey, which was reported in 1942 to have been indefinitely suspended because of a charge against him of fraudulent advertising. As long ago as 1913 he was advertising himself as an "Office Specialist" in Atlantic City newspapers. He has also advertised in *Physical Culture* and, for a time, at least, conducted "Dr. Dubler's Private Sanatorium and Natural Health School" at Camden, which advertised "No Drugs—No Serums—No X Rays—No Radium—No Operations." After the Post Office Department had investigated his recent activities, it summoned him to a hearing in Washington, to show cause why he should not be debarred from the mails on the charge of obtaining money under false and fraudulent pretenses. At the hearing a Senior Medical Officer of the Food and Drug Administration testified for the government, showing that he had had extensive experience in studying and treating various types of appendicitis, including the surgical treatment thereof. He discussed the various forms that the disease takes and their scientific treatment, without which, he showed, the condition can be extremely dangerous. Further, he pointed out the risk to an appendicitis patient in following Dubler's advice. This advice, Dubler admitted, differed in every phase from orthodox medical opinion. His testimony frequently was evasive and uncertain as to medical matters incident to his diagnosis and treatment of appendicitis, and he frequently confessed ignorance of medical facts relating thereto. Further, he admitted that he had served a sentence in a Pennsylvania prison for "conspiracy to perform abortions." The findings in the case were that the charges against Dubler were entirely sustained by the evidence, and on July 13, 1944, a fraud order was issued against William J. Dubler, the Victor Press, and their officers and agents.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American J. Obstetrics and Gynecology, St. Louis 50:235-352 (Sept.) 1945. Partial Index

- *Effect on Infant Mortality of Vitamin K Administered During Labor. Edith L. Potter.—p. 235.

- Treatment of Trichomonas Vaginitis with Sulfonamide Compound. Helen M. Angelucci.—p. 336.
- Transmission of Penicillin to Amniotic Fluid and Fetal Blood in the Human. J. H. E. Woltz and H. A. Zintel.—p. 338.

Vitamin K and Infant Mortality.—Potter reports a study of two groups of infants: one of 6,560 infants weighing over 1,000 Gm. born in the two year period when vitamin K was given to the women before delivery and a group of 6,630 infants born during the next twenty-two months when vitamin K was not administered. The total fetal and infant mortality rate per thousand births of 29.8 for the first two years is higher than that of 25.8 for the last two years in spite of the fact that no change of significance occurred in the incidence of primiparity, premature delivery, mode of delivery or other known factor. The mortality rate for liveborn infants is identical in the two series, as is the number of infants who showed evidence of hemorrhage on postmortem examination. Potter concludes that no decrease in infant or fetal mortality can be expected to result from the routine administration of vitamin K.

Responses to Gonadotropic Therapy.—Davis and Hamblen have shown that the sequential and cyclic administration of equine and chorionic gonadotropins (one-two cyclic gonadotropic therapy) restores to a fertile status a significant number of women with hypofunctioning ovaries. A commercial product which contains both pituitary synergist and chorionic gonadotropin is now available for therapeutic use. The authors report a comparative study of the two methods of treatment in 21 patients who are placed into four clinical groups: (1) those with deficient sexual maturation whose menarches had not occurred (4 patients), (2) those with infrequent and/or scanty estrogenic bleeding (6 patients), (3) those with prolonged and/or excessive estrogenic bleeding (5 patients) and (4) those with presumed ovarian sterility associated with bleeding from immature progestational endometriums (6 patients). The primary criterion for an evaluation of these responses was a study of endometrial biopsies taken prior to and following treatment. None of the patients with deficient sexual maturation responded to either therapy. Patients with infrequent and/or scanty estrogenic bleeding and those with prolonged and/or excessive estrogenic

bleeding responded to both therapies. More positive responses were associated with one-two cyclic gonadotropic therapy. No pregnancies were associated with either therapy in the group of patients with presumed ovarian sterility associated with bleeding from immature progestational endometriums. The authors conclude that cyclic therapy with a preparation containing "pituitary synergist" and chorionic gonadotropin (30 "synergy units" intramuscularly daily from the fifth through the twenty-fourth day of the cycle) may produce progestational endometriums in patients experiencing various grades of estrogenic bleeding. This therapy yields a lower incidence of positive responses than one-two cyclic gonadotropic therapy, which employs singly and sequentially equine and chorionic gonadotropins.

- Benign Capillary Hemangioma of Digital Flexor Tendon Sheath: Case Report. G. V. Webster and C. F. Geschickter.—p. 444.

Skull Fractures.—Summarizing his observations on 100 cases of compound comminuted fractures of the skull, Campbell says that inner table fractures were sometimes overlooked and occasionally led to serious complications. Tripod incisions often gave trouble; it is recommended that they be avoided when possible. Convulsions were uncommon in the first few weeks; their occurrence was sometimes an early manifestation of abscess formation. Subdural hematoma was present in but 2 cases. Superficial wound infections of varying degrees developed in 19 cases, while in 22 the infections were deep seated. These were manifested by abscess, meningitis or cerebral fungus. There were five deaths, all of which occurred in the latter group. Incomplete débridement was the largest single factor contributing to wound infection. In those cases in which all bone fragments had been removed infection was uncommon and seldom deep, whereas if débridement had been incomplete or not performed infection was common and usually deep. Bacteria cultured from these wounds were principally skin inhabitants of low virulence. Treatment consisted in evacuation of pus and removal of associated bone fragments and/or metallic foreign bodies as well as of adjacent necrotic tissue and old blood. Abscess capsules were disturbed as little as possible. Sulfonamide therapy was employed as an adjuvant. Failures resulted only in those 5 cases in which, for one reason or another, this procedure was not carried out. Experience, judgment and skill, as well as the proper neurosurgical armamentarium, are prerequisite to good primary débridement.

Injuries of Extraperitoneal Rectum.—Croce and his associates treated patients in various stages of convalescence from war wounds of the rectum. They feel that progress has been made during this war in the management of extraperitoneal injuries of the rectum. They emphasize the part played by surgical prophylaxis in contrast to the supportive measures of blood, plasma and chemotherapeutic agents. The latter may influence the early mortality rate in assisting recovery from shock but not the morbidity or late mortality from chronic sepsis. These supportive measures have proved to be merely adjuvants and not substitutes for early and properly executed surgery. The authors stress the following points: 1. Perforation of the intraperitoneal portion of the rectum results in fecal contamination of the cellular tissue of the intraperitoneal space. This space communicates with the retroperitoneal space posteriorly over the sacrum and may thus result in fulminating and widespread retroperitoneal sepsis. 2. Even if the perforation cannot be located but there is presumptive evidence of its presence or potential development from contusion or infarct of the rectum

as judged from the course of the missile and the presence of a large hematoma in the infraperitoneal space, an effective sigmoid colostomy should be established at once. 3. A sigmoid colostomy alone will not prevent infection of the infraperitoneal space, although the infection is likely to be less widespread and fulminating. In addition, the infraperitoneal perirectal space must be saucerized by coccygectomy and loosely packed. 4. Mere saucerization of the perirectal space, while life saving and prophylactic against spreading retroperitoneal sepsis, is not ideal treatment. Unless the perforation is located and closed, a persistent fistula may develop.

Hepatic Necrosis Caused by Sulfadiazine.—Herbut and Scaricciottoli report 2 cases of acute diffuse hepatic necrosis resulting from sulfadiazine therapy. In 1 case sulfonamide compounds had not previously been given, whereas in the other a course of treatment with sulfadiazine had been given one month before a second course was administered. It is thought that while focal hepatic necrosis may result from direct chemical action of the sulfonamide compounds on the liver cells, diffuse hepatic necrosis may be the result of inherent or acquired hypersensitivity of the liver to the drug. Of the two types of renal damage ascribed to the sulfonamide compounds, the authors believe that the type in which crystals or concretions are found in and beyond the renal tubules is due to the direct action of the sulfonamide compounds on the kidney. The more severe form, showing tubular necrosis, casts and interstitial congestion and edema, with foci of inflammatory cells, is due to the accompanying disease process, which may be infection, intestinal obstruction, jaundice or some other condition and not to direct action of the drug on the renal parenchyma. The 2 cases reported here emphasize the fact that sulfadiazine should be used cautiously.

Pulmonary Sclerosis in Progressive Scleroderma.—Getzowa observed peculiar cystic changes in the lungs in 2 cases of scleroderma. These cases showed disappearance of alveolar tissue in the lung as a result of two distinct processes: lysis of the alveolar walls and progressive sclerosis. Cystic pulmonary sclerosis occurred with a hyaline or hyaline fibrous process involving the alveolar walls, accompanied by the disappearance of capillaries superimposed on generalized diffuse simple fibrosis of the alveolar walls. After dissolution of the hyaline portions of the walls, the process led to disappearance of alveolar parenchyma. After a preliminary fibrous stage the alveolar parenchyma was replaced by cystically enlarged bronchiolar proliferations, a process for which the name "cystic bronchiolar hyperplasia" is proposed. The cysts are present in the subpleural zones with the exception of the apexes and the hilar regions. Compact pulmonary sclerosis developed on the basis

of diffuse alveolar fibrosis of a progressive nature with disappearance of capillaries and parenchyma, owing to progressive narrowing of alveoli. There was no dissolution. The capillaries persisted and with them the alveoli, and extensive interalveolar fibrosis developed. The bronchi and bronchioli which remained intact in the fibrous areas were surrounded by peribronchial proliferations forming adenoma-like zones.

Salicylate and Rheumatic Activity.—Murphy studied the clinical course and histologic character of rheumatic lesions in 12 actively rheumatic patients treated with large doses of salicylate. In 6 patients the size of involved joints and in 6 patients the size and skin temperature of the involved joints were followed by direct measurement in an attempt to determine the effect of salicylate on the local rheumatic inflammation. The results in this small series of cases do not support the widely accepted view that salicylate reduces rheumatic joint inflammation. In several of these patients characteristic rheumatic lesions developed in a variety of sites during the course of salicylate therapy. In 2 cases tendon sheath nodules developed with serum salicyl levels above 300 and 450 micrograms per cubic centimeter respectively. In another case a tenosynovitis developed with the serum salicyl level between 350 and 265 micrograms per cubic centimeter. A florid rheumatic pneumonitis developed in a fatal case with the serum salicyl level above 300 micrograms per cubic centimeter. Another striking finding at necropsy in this case was the fresh fibrin thrombi in the capillaries of practically every glomerulus in sections of both kidneys. In a fifth patient an episcleral nodule developed with the serum salicyl level between 450 and 600 micrograms per cubic centimeter. In a sixth patient joint rheumatic activity became manifest for the first time during the course of heavy salicylate therapy (after fifteen days of large doses of salicylate) associated with electrocardiographic evidence of increased cardiac rheumatic activity.

Chronic Delirium in Organic Dementia.—Patients with organic dementia who become delirious are divided into two groups by Levin. In one group the delirium is produced by a toxemia. Here the delirium comes on acutely and clears up after the patient has been rid of his toxemia. In the other group the delirium is unrelated to any toxemia; it comes on furtively after the dementia has reached a certain degree of severity and, once established, persists months and even years until death. It is a mistake to say that delirium is always transitory. It is a symptom of damage to the highest cerebral centers and is transitory if that damage is toxic and reversible but is permanent if the damage is destructive and irreversible. The psychiatric picture of senile delirium and of paralytic delirium is in all essential respects indistinguishable from that of toxic delirium. The distinction between toxic and senile (and between toxic and paralytic) delirium can be made only in the light of the history, the presence or absence of toxemia and the outcome.

"Jungle Rot."—According to Travis the term "jungle rot" is a misnomer for fungous infections of varied etiology in the tropics. The characteristic lesion is a circular pustule varying in size from $\frac{1}{8}$ to $\frac{1}{2}$ inch, with a distinct elevation of the superficial layers of skin. The usual sites are the axillae, the adjacent surfaces of the upper part of the arm and the groin. The lesions apparently spread by extension to contiguous surfaces and show progressive outcroppings, some being frankly bullous and others simply papular in the early stages. Some of these lesions have been in existence for six weeks despite medical attention. Travis was able to cure approximately 50 such cases in from four to six days by means of a mixture of alkyl dimethyl benzyl ammonium chlorides. The circinate, pustular bleb is incised with a lancet scalpel after primary skin antiseptics with a dilution of the mixture. The superficial ulceration is rubbed with the mixture on a cotton tipped applicator. This process is repeated two times daily for approximately two days. By the third day treatment is nearing completion and lesions heal by primary intention.

Ruptured Uterus.—Beacham and Varino review 64 cases of rupture of the pregnant uterus occurring from 1912 to 1941 at the Charity Hospital of Louisiana at New Orleans. The high maternal mortality (60.93 per cent) and fetal fatality (73.43 per cent) in this and other large hospital series can be explained in part on the basis that complicated and mismanaged labors gravitate to hospitals. Forty-five of the Charity Hospital cases were designated as emergencies at the time of admission. Evidence of shock during or following labor should call for a prompt consideration of the possibility of ruptured uterus. Rupture of the uterus after "low" cesarean section is rare. Nevertheless, every woman who has undergone a cesarean operation must receive close supervision during each subsequent pregnancy. Classic section cicatrices are particularly vulnerable to rupture, providing foundation for the statement "once a classic section always a section." A woman in this group had undergone one classic and two low operations. Rupture occurred at the site of the classic incision. Uterine rupture subsequent to myomectomy is rare. Rupture of the uterus requires immediate therapeutic action. This series and a study of reported cases substantiate the belief that hysterectomy is the procedure of choice. The administration of blood and in many cases of plasma also, with other anti-shock measures, is of great value.

Vitamin E in Fibrositis.—Thirty-one patients were treated with vitamin E in the form of an ointment which contained 30 per cent of solvent-extracted wheat germ oil. Of these 31 patients 19 received inunction therapy only. In 6 the external application was supplemented by the oral administration of 3 mg. capsules of mixed tocopherols daily. In 4 the external application was supplemented by a diet high in vitamin E (green leafy vegetables, lettuce and whole wheat bread). Only 1 patient received all three measures, 1 received oral therapy alone and the other oral therapy with a high vitamin E diet. The patients ranged in age from 28 to 66 years; 8 were women and 24 men. The symptoms had been present for three weeks to five years. In some cases the condition affected only a small area, such as both hands; in others much greater areas were involved. Treatment lasted from two to sixteen weeks. Improvement was pronounced in 20 cases, fair in 9 and absent in 3 cases. Of the cases in which only inunction therapy was administered more than two thirds showed excellent results, the others fair improvement. The less favorable results obtained in those receiving other forms of vitamin E therapy indicate that oral and other therapy is not the determining factor in reinforcing the action of external application of vitamin E.

Vaginal Smear in Diagnosis of Uterine Cancer.—In 1943 Meigs and his associates reported 220 cases studied for cancer by vaginal smear. Since then the authors have studied an additional 795 cases, making a total of 1,015 cases, with a total error of 4 per cent. The patients for this study came from the Vincent Memorial wards and the Tumor Clinic of the

Massachusetts General Hospital and from the private practices of several physicians. In this series of 1,015 cases microscopic section revealed cancer in 154. Of these 154 positive cases 16 were incorrectly called negative by vaginal smear. This is an error of 10.3 per cent. The mistakes in this group of cases fall into two categories. The first includes smears in which cancer cells were present but were not seen on the original examination of the slide. These cells were missed because not every field was examined. Seven of 16 mistakes were of this type. The second group are those in which no cancer cells were found, even after the slides were reviewed. We must assume that in these 9 instances malignant cells did not exfoliate or that degeneration of the malignant cells had occurred. To illustrate the value of the vaginal smear in the early diagnosis of cancer the authors present 8 cases diagnosed primarily by vaginal smear. They stress that the vaginal smear and biopsy are complementary techniques which, used together, will enhance the effectiveness of the diagnostic clinic. Large numbers of women may be screened and those with positive smears studied further by biopsy. The authors do not regard a negative smear as excluding cancer, nor do they regard a positive smear, without biopsy corroboration, as an indication for surgery.

Thiouracil in Preoperative Treatment of Hyperthyroidism.—Lahey and his collaborators employed thiouracil in the preoperative management of 190 severely toxic hyperthyroid patients. Both types of hyperthyroidism were represented in this group—primary hyperthyroidism, and adenomatous goiter with hyperthyroidism. Response to thiouracil therapy was equally satisfactory in the two groups. In the first 100 patients treated there were 85 females and 15 males. The average age was 45 years. Forty-four patients were over 50 years of age. Almost half, 43 patients, had had hyperthyroidism for more than two years. The average basal metabolic rate was +49; 54 patients had initial rates over +45. Only those with hyperthyroidism and associated heart failure or those extremely ill from hyperthyroidism were admitted to the hospital. In the former group, combined cardiac and thiouracil treatment was begun, and when cardiac compensation was restored after ten to fourteen days these patients were discharged to carry on treatment at home. In the latter group improvement was usually sufficient after seven to ten days to permit continuance of treatment at home. For most patients thiouracil treatment is ambulatory throughout. Thiouracil was administered in a total daily dose of 0.6 to 0.2 Gm. at 7 a. m., 2 p. m. and 9 p. m. It has been found that approximately one day of treatment with 0.6 Gm. of thiouracil is required for each percentage of elevation in the basal metabolic rate. When the first patients receiving thiouracil underwent thyroidectomy the thyroid gland was found to be soft and friable, and bleeding of the entire operative site was so extensive that it was difficult to keep the field sufficiently dry to carry out the usual surgical technique. The friability of the thyroid gland was overcome when Lugol's solution was administered during the three week period immediately before operation. For two weeks the iodine and thiouracil were administered simultaneously, and during one week preoperatively the thiouracil was discontinued and only iodine administered. Toxic manifestations developed in 23 patients receiving thiouracil. The reactions consisted of granulocytopenia in 9 patients, fever reactions in 7, skin eruption in 4, sclerodema in 2 and swelling of the salivary glands in 1. Leukopenia with granulocytopenia is the most serious and alarming of all the reactions. Four patients developed the clinical picture of agranulocytic angina, 2 mild and 2 severe; 1 of the latter patients died. The occurrence of toxic reactions in 11 per cent of the patients indicates the necessity of careful observation during treatment.

Gas Gangrene.—Gledhill reviews observations on 33 cases of gas gangrene that were seen at a forward general hospital in Italy between September and November 1944. During the period under review 2,951 battle casualties were admitted to the hospital. Thus the incidence of gas gangrene was 11 per thousand. Three clinical types of gas gangrene were seen. Gas abscess, which was observed in 6 cases, was characterized by a swollen tense painful limb with localized edema and induration. On incision a gush of foul smelling pus and gas escaped from a cavity in which a foreign body was often lodged. Response to drainage and chemotherapy was rapid. In clostridial myositis, which was observed in 17 cases, extensive necrosis of muscle was always present with swelling, induration and frequently crepitation. Isolated muscle groups were rarely involved alone. More often there was a widespread infection of all the muscles along the track of the missile. There was severe general toxemia. The 10 cases of fulminating gas gangrene presented a picture of grave toxemia. The local signs were those of severe clostridial myositis with the viability of the limb often in doubt. The general condition varied from semicoma to muttering delirium. In the treatment of gas gangrene, early surgical removal of the source of toxemia is still the basis of treatment. Penicillin used prophylactically, both locally and parenterally, did not prevent the onset of gas gangrene. In treatment penicillin appears to be of extreme value. The usual dosage locally was a total of 17,600 Oxford units per tube. From 300,000 to 500,000 units was the average parenteral dose per case. Most patients were given a course of from 25 to 30 Gm. of sulfathiazole. A few had intravenous sulfadiazine or local sulfonamide powder. Every patient was given from 2 to 4 pints of whole blood and gas gangrene antiserum. The efficacy of the combined use of surgery, penicillin, sulfonamides, blood transfusion and serum was proved by the fact that only one death occurred among the 33 patients, and this occurred after the clostridial infection had been controlled.

Cerebrospinal Meningitis.—The material on which this study is based consists of 60 patients referred to a neuropsychiatric center after attacks of cerebrospinal meningitis; 53 showed symptoms, these being severe in 23, moderately severe in 23 and mild in 7. The duration of symptoms ranged from a week to two years, but most patients were seen from three to six months after the acute illness. In 34 of the 53 with residual symptoms the principal complaint was of headache,

in 7 lassitude, in 3 backache and in 3 "effort" symptoms. Ataxia, postural dizziness and depression overshadowed other complaints in 2 cases each. Although the severity of the acute disease is an important factor in determining the severity of the sequelae, there is a stronger positive correlation between the severity of sequelae and the degree of psychoneurotic predisposition. Of the 53 patients with symptoms 4, with very mild sequelae, were returned to duty without further treatment and 49 were treated in convalescent depot for about four weeks. Treatment consisted of psychotherapy and graduated exercises. Of the 49 so treated 45 were returned to duty and 4 invalided. The evidence suggests that the symptom complex should be regarded as a psychosomatic reaction. Suggestion plays a significant part in the production and perpetuation of the symptoms.

Bronze Diabetes.—During a period of fifteen years Boulin saw 70 cases (1.66 per cent) of bronze diabetes among 4,266 persons with diabetes mellitus. There were 59 men and 11 women. Familial pigmentation in the absence of cirrhosis or diabetes mellitus was present in 5 patients (7 per cent). Bronze diabetes differs considerably from diabetes mellitus. It is distinguished by its association with hepatopancreatic sclerosiderosis, by the absence of any hereditary characteristics and by the character of its glycogen-regulatory disturbances, which are as follows: In almost every case the severe diabetes associated with acidosis requires the administration of insulin. The diabetes is progressive and may require increased doses of insulin. Insulin resistance develops quickly and may be progressive. Hypoglycemic accidents resulting in death occurred in 25 of the 70 cases (35 per cent) in spite of the insulin resistance. Bronze diabetes is a disorder of long duration presenting various phases: melanoderma, followed by cirrhosis, which often is latent, and diabetes mellitus as the final and fatal phase of the disease. It may take ten years or even the greater part of the patient's lifetime for the condition to progress until all three conditions may be present at the same time. These findings support the concept of a congenital disorder of metabolism.

Dystrophia Myotonica.—Franceschetti and Mach describe 3 personally observed cases of dystrophia myotonica and stress the importance of myotonic cataract in the differential diagnosis. In the atypical forms of Steinert's disease only the presence of a myotonic cataract permits a definite diagnosis. The biomicroscopic examination of the crystalline lens is indispensable for the differentiation of myotonic dystrophy from other myopathies and particularly from congenital myotonia. The appearance of a creatinuria after an aminoacetic acid tolerance test is of great diagnostic value in that, in progressive muscular atrophy, in congenital myotonia, in myasthenia gravis and in the muscular atrophies of the Charcot-Marie type, creatinuria is nearly always increased after the test, but neither spontaneous nor induced creatinuria is necessarily present in myotonic dystrophy. They observed the favorable effect of vitamin E in a patient with myotonic dystrophy as well as in a case of idiopathic muscular dystrophy (Erb's disease). The therapeutic effect of vitamin E on the muscular function is accompanied by improvement in the creatine metabolism. Myotonic dystrophy has a special place in that some of its symptoms indicate a lesion of endocrine glands while others indicate a nervous origin. It is possible that both of these factors are involved.

Book Notices

Government in Public Health. By Harry S. Mustard, B.S., M.D., LL.D., DeLamar Professor of Public Health Practice and Director, School of Public Health, Faculty of Medicine, Columbia University, New York. Studies of the New York Academy of Medicine, Committee on Medicine and the Changing Order. Cloth. Price, \$1.50. Pp. 219, with 3 illustrations. New York: Commonwealth Fund; London: Oxford University Press, 1945.

If civil government is to become a field for scientific inquiry and analysis with the result that public services for health may be carried out at local, state and federal levels on a rational and logical basis instead of by political, financial and in fact emotional opportunism it will be because there are students, practitioners and authors with the courage, imagination and sound philosophy of American citizenship shown by Dr. Mustard.

We can go far and fast with the new potencies of preventive medicine as a partner of civil government if our legislators and the elected officers of local and state governments will take to heart the problems and disabilities inherent in our triangle of authority and expenditures for the public health, so tersely presented by Dr. Mustard. Here we have history of past events, their successes and failures, coupled with current experience of the administrator, the student and the teacher, serving as a background on which a sounder foundation and a nobler structure of great social significance can be built.

This book, one of an important series, was written to inform the leaders in the practice and teaching of medicine of the scope of public health as it has been and may become. It is a clear and unbiased record of that revolution which the knowledge of human biology has demanded in the functions and organization of a society dominated by partisan politics. Of the six chapters the first and last are of special merit, giving as they do the necessary definitions, the philosophy and practical considerations at the beginning, and a summary of trends and discussion of certain needs to close the volume. Chapters two to four deal respectively with federal, state and local health services without fear or favor, and very much to the point for all workers in this field of science applied through government for social progress. The fifth chapter gives a description of the content of a public health program of today.

This book is full of material ready to hand for those who would wish to influence public policy and performance, the promoters, salesmen and disciples of public health. No student or teacher of public health, the general field of medical administration or preventive medicine at the medical school or post-graduate level can afford to go without this book, and we may hope that the public health committee of each county and state medical society will read and accept the good sense so pleasingly set before us. The reviewer is particularly delighted with the unequivocal condemnation of the present position of the Children's Bureau in our federal health structure.

For immediate adoption as a social philosophy let us remember these two sentences: "At present local governments choose whether or not they will organize effective local health service. The time has come to follow precedent and make the provision of effective local health service a requirement." The literary and historical student will be especially intrigued by the quaint texts of the original documents quoted as a frontispiece and in the appendix. The book in form as well as in content is to be cordially recommended to physicians, nurses and administrators of official and voluntary health agencies.

New and Nonofficial Remedies, 1945: Containing Descriptions of the Articles Which Stand Accepted by the Council on Pharmacy and Chemistry of the American Medical Association on January 1, 1945. Issued Under the Direction and Supervision of the Council on Pharmacy and Chemistry of the American Medical Association. Cloth. Price, \$1.50. Pp. 760. Chicago: American Medical Association, 1945.

The successive volumes of *New and Nonofficial Remedies* represent an invaluable service to their profession by a distinguished group of scientists, the Council on Pharmacy and Chemistry. Through the years the membership of this body has changed, but its freely given and impartial devotion to the best interests of rational, scientific therapy is unchanging. In this volume the physician may find the best and most useful of the newer pharmaceutical agents. If a new or not yet official drug is not here described, the physician should hesitate to use

it without finding out why it does not appear. If the agent was formerly described in the book and does not appear, the Council considers that it has not fulfilled its promise of usefulness. Fifteen or twenty newly accepted preparations appear. A large number of preparations have been omitted, mainly brands of official preparations. The general statements concerning these pharmacopoeial preparations have been retained for the information of physicians.

As stated in the preface, the entire book has been scanned to bring it up to date with the latest medical knowledge. It is noted that the section "Articles and Brands Accepted by the Council But Not Described in N. N. R.," a remnant of which appeared in the 1944 volume, has now entirely disappeared. Many of the official preparations have been transferred to the body of the book and the others deleted. Much medical information is contained in this volume; certainly no other compendium of comparable price contains so much.

Nitrous Oxide-Oxygen Anesthesia: McKesson-Clement Viewpoint and Technique. By F. W. Clement, Major M. C. (A. U. S.). Second edition. Cloth. Price, \$4.50. Pp. 288, with 92 illustrations. Philadelphia: Lea & Febiger, 1945.

In the second edition of this book the author has made changes in detail rather than any alterations of the original text. As far as fundamental principles are concerned the story is again one of personal experience and technic employed by the author and his late associate Dr. E. I. McKesson, together with certain suggestions that have been sent to him by some of his friends. He has attempted to cover briefly the history and theory of anesthesia and has tried to present the physiologic aspects of the situations confronting the anesthetist who applies nitrous oxide and oxygen to various types of patients under various conditions. The author has had a wide experience both in civilian practice and in army hospitals. Possession of this book is of considerable value to the general anesthetist, as it brings him into direct line with the latest points of view of the author, who is one of the most skilled administrators of nitrous oxide and oxygen.

Endurance of Young Men: Analysis of Endurance Exercises and Methods of Evaluating Motor Fitness. By Thomas Kirk Cureton, Warren J. Huffman, Lyle Welsler, Ramon W. Kirells and Darrell E. Latham. Monographs of the Society for Research in Child Development, Volume X, No. 1 (Serial No. 40). Paper. Price, \$2.50. Pp. 284, with illustrations. Washington, D. C.: Society for Research in Child Development, National Research Council, 1945.

The Society for Research in Child Development associated with the National Research Council has made available a report which represents a two year study made by five members of the University of Illinois School of Physical Education. Three thousand men were tested on twenty-eight endurance exercises, and some of them were tested with organic condition tests. According to this report the step test devised by the Harvard Fatigue Laboratory is a poor exercise for measuring all round athletic endurance. The Army and Navy have used excellent testing events, such as climbing the bar, push ups and the 300 yard shuttle run. According to these studies the mile run is shown to be of the greatest all round value in measuring all the constituents of endurance.

Scientific Societies in the United States. By Ralph S. Bates, Ph.D. A Publication of the Technology Press. Massachusetts Institute of Technology. Cloth. Price, \$3.50. Pp. 246. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd., 1945.

The contribution of scientific societies to the advancement of knowledge is one of the finest exemplifications of democracy at work. Much of the intensified progress in science during the war was brought about by scientific organization in which our scientific societies played a conspicuous part. The volume by Dr. Bates considers the subject chronologically, moving from the earliest societies in eighteenth century America to the triumph of specialization in the period between 1866 and 1918 and considering finally the growth of science up to 1944. This was the period during which American societies effected their international relationships—a period which will perhaps culminate in the formation of special sections of the organization of the United Nations devoted to health and science. A final chapter concerns the increase and diffusion of knowledge by means of the scientific societies. An extensive, well arranged bibliography and a fine index complete the work.

THE PETIT MAL EPILEPSIES

THEIR TREATMENT WITH TRIDIONE

WILLIAM G. LENNOX, M.D.

BOSTON

The specific relationship of age to the seizures of epilepsy has been inadequately set forth. Seizures of course may begin at any age between birth and senility, but the incidence of various types of seizures and of various patterns of electroencephalographic seizure discharges is different in children and in adults. A comparison of the clinical and the electroencephalographic diagnoses in 530 children and in 730 adults is calculated from data collected by the Gibbses and Lennox¹ and is shown graphically in figure 1. Forty-two per cent of this group of 1,260 epileptic patients were less than 20 years of age. Yet, of those having only petit mal, 84 per cent were under 20 years. Of those whose electroencephalograms were of the two per second spike and wave pattern (petit mal variant), 80 per cent were under 20 years, and of those with the three per second dart and dome formation (petit mal) 65 per cent were not yet adult. Tabulation based on the age of the patient when seizures began would be even more specific. I remember no case in which petit mal (pyknoepilepsy) began after the twentieth year. Inspection of this figure makes clear the fact that seizures associated with an alternate spike and slow smooth wave of the electroencephalogram are predominantly seizures of childhood or puberty which tend to disappear as the person becomes adult. A more detailed chart illustrating this point graphically is presented in the article mentioned.¹

The electroencephalographic classification of alternate spike and wave brings together a triad of seizures having diverse clinical manifestations. The first (petit mal) is a transient lapse of consciousness, the second (myoclonic epilepsy) a single quick contraction of muscles and the third (akinetic epilepsy) a sudden loss of postural control. In spite of this disparity in appearance, these three types of seizures have a number of characteristics in common: great frequency, brevity of attacks, abrupt onset and termination, maintenance of mentality, sensitivity to changes in the acid-base balance or in the concentration of oxygen or of sugar in the blood, a strong tendency to spontaneous recovery with age and, except in some akinetic cases, absence

of evidence of cerebral pathologic change and, finally, resistance to ordinary anticonvulsant drug therapy but relief from a new preparation to be described presently. These three types of seizure may occur alone or together or perhaps in combination with grand mal or psychomotor seizures. Each will be described.

PETIT MAL (PYKNOEPILEPSY)

Definition of the petit mal form of seizure is important. Many, probably most, doctors define petit mal as a small or mild seizure of any sort. This conception is illogical and when used in drug therapy may lead to embarrassing failure. Disease classification is based on difference in kind and not on difference in degree—a mild case of typhoid is just that and not something with another name. Although the clinician who originally used the terms grand mal and petit mal may have thought only of size, we now know that the three main manifestations of epilepsy—convulsions (grand mal), periods of amnesia (psychomotor) and transient lapses of consciousness (petit mal)—are distinct also as regards drug therapy.² The term pyknoepilepsy is preferable to pyknolepsy because this form of seizure is not, like narcolepsy, something different from epilepsy. It is epilepsy in its purest form.

Petit mal, pyknoepilepsy or dart and dome dysrhythmia, whichever term is preferred; consists of a lapse of consciousness lasting from five to thirty seconds of time. The person is usually immobile, and muscular movements, if any, are confined to rhythmic jerking or twitching at the rate of three per second of the eyelids or brow and, rarely, of the head and arms. These temporary "blackouts" recur usually every day, from five to scores of times a day. There is no aura or after-symptom. Seizures begin and end abruptly. Rarely, however, the child may be in a state of confusion lasting for hours which the electroencephalograph proves is a petit mal status. If there is any rigidity of muscles, if the person does automatic purposeless things or if he mumbles, groans or makes chewing motions the attack is probably a short psychomotor seizure and not a petit mal. Involuntary muscle movements, if present, are clonic in petit mal and tonic in psychomotor seizures.

Petit mal seizures are more likely to occur in the minutes or hours after rising; they may be precipitated by emotion, excitement or in females by menstruation and are much less frequent during physical or mental activity. Girls are more often affected than boys. Mentality is not impaired even by scores of thousands of seizures. In fact, patients with pure petit mal seem

¹ Paper published under the auspices of the Section on Pediatrics, From the Department of Diseases of the Nervous System, Harvard Medical School, and the Children's Hospital. Aid was received from the Rockefeller Foundation. This is number XLVI in a series entitled "Studies in Epilepsy."

unusually bright. I have made intelligence tests routinely of private patients. In a group of 33 patients who had experienced an average of nearly 30,000 petit mal and 30 grand mal seizures the majority had Wechsler Bellevue scores of from 120 to 139, which classified them as intellectually superior or very superior.

If a child gives a history of daily petit mal, seizures can usually be precipitated for inspection by having

Fig. 1.—The proportion of various types of seizures and of electroencephalographic seizure discharges which occur in patients under 20 years of age. The figures at the base of the column refer to the number of patients in the group. The length of the columns corresponds with the percentage of each group who are under 20 years. Thus, of the 93 patients who had a history of having petit mal only, 84 per cent were less than 20. Percentage figures represented by the length of columns from the top down, are 84, 53, 37, 33, 26 and 80, 65, 52, 27. Data dealing with the clinical classification of seizures and with electroencephalographic records are taken from the same group but only the classification are shown on the lower half of the chart.

him overventilate his lungs, which causes alkalosis and thereby increases instability of the cortical potentials. In 82 per cent of patients with a history of petit mal, the characteristic three per second alternate dart and dome formation, first described by Davis, Gibbs and Lennox,³ is present on an electroencephalographic examination which includes a short period of hyperpnea⁴ (fig. 2). Typical petit mal discharges may occur without coincident clinical symptoms, subjective or objective, but in such cases the subclinical seizure discharge is short, from one to four seconds long, or is discontinuous and may not appear simultaneously in all leads. This alternate dart and dome formation is sensitive to chemical changes in the blood passing through the brain. Discharges are made more numerous by alkalosis, hypoglycemia or hypoxemia and are suppressed by the opposite conditions.

MYOCLONIC EPILEPSY

Myoclonic shocks or jerks are single contractions of the flexor muscles, usually involving one or both arms but sometimes muscles of the trunk as well. There is no detectable loss of consciousness. These are similar to the muscular jerks which many healthy persons experience on falling asleep. Myoclonic jerks most often occur in patients subject to petit mal, although they may form the aura of grand mal. Occurrence in the absence of a history of some other form of seizure is extremely rare. Like petit mal, they are most frequent in the morning hours. Except for the embarrassment of a

sudden unexplainable movement, the seizure is innocuous. Myoclonic epilepsy is not to be confused with the extremely serious myoclonus epilepsy. Much of the book by Muskens⁴ is devoted to this subject.

If an electroencephalogram is made at the time of a myoclonic shock, a single dart and dome may appear coincidentally on the record (fig. 3). If it is absent the electrical discharge presumably is confined to subcortical areas of the brain or to the spinal cord.

AKINETIC EPILEPSY

Akinetic ("lack of motion") seizures were called "static" by Ramsey Hunt⁵ and are rarely encountered in adults. They consist of a sudden loss of postural control, with nodding of the head or, if generalized, a sudden fall. Without any warning, and without coincident muscular jerk, the child collapses. Usually he gets up immediately but may lie limp and unconscious for several minutes. The momentary attacks, like petit mal, may occur dozens or even hundreds of times during the day. Except for the lack of an emotional excitant, the phenomenon resembles the cataplectic attacks which accompany narcolepsy.

Various circumstances make akinetic epilepsy more confusing and less hopeful than petit mal or myoclonic epilepsy. As in cataplexy, there may be a history of encephalitis, or there may have been birth injury or asphyxia also suggesting a midbrain lesion. The electroencephalogram made when the patient is without symptoms may contain a plethora of abnormalities; long runs of smooth, evenly spaced three per second waves without spikes, bursts of discontinuous or atypical three per second petit mal formations and two per second petit mal variant formations occurring singly or in series or as a focus of malactivity in one lead only, or there may be a mixture of these dysrhythmias appearing at intervals in a normal appearing record (fig. 4).

SIGNIFICANCE OF THE SPIKE AND WAVE PATTERN

The spike and wave is the only pattern appearing in a routine testing which is distinctive for epilepsy. However, there is a vast difference between the three per second dart and dome (petit mal) and the two

Fig. 2.—Samples of the petit mal and petit mal variant type of dysrhythmia. At the left of each tracing is the patient's normal rhythm. The upper tracing taken during a petit mal seizure is of very high voltage (the signal at the right marks 200 microvolts) and consists of an alternate dart and dome recurring two and one-half times per second. The lower tracing, taken when the patient appeared to be normal, contains a spike and wave recurring one and one-half times per second, the signal at the right marks 50 microvolts. The horizontal line at the bottom measures one second.

per second blunt spike and wave (petit mal variant) formations (fig. 2). The petit mal type of discharge is most common in essential (genetic) epilepsy. The dysrhythmia usually appears simultaneously in all leads

and coincides accurately with any period of unconsciousness, and the spikes with any clonic movement. The appearance of the pattern possesses individuality for each patient. Petit mal discharges, no matter how numerous, carry a good prognosis for recovery and maintenance of mentality. They are easily affected by certain alterations in the chemistry of the circulatory blood.

Fig. 3.—Sample of the electroencephalogram of a patient having frequent myoclonic shocks. The dart and dome formation and the muscular jerks were synchronous, although jerks were not always accompanied by disturbance of cortical potentials. In this patient the disturbance was maximal in the left parietal area. Intravenous injection of 0.5 Gm. of caffeine with sodium salicylate was followed by the disappearance of both jerks and dysrhythmia. The signal at the right marks 20 microvolts and the line at the bottom one second.

In contrast, the petit mal variant type of discharge, which occurs only one sixth as frequently, most often occurs in brain injured (symptomatic or acquired) epilepsy; it is often focal; accompanying symptoms may be absent or only a mild confusion. The prognosis, perhaps because of associated pathologic changes, is generally poor for both recovery and mentality and the discharges are little affected by changes in blood chemistry.

TREATMENT

The treatment of this triad of phenomena, in contrast with the grand mal or psychomotor seizures, has been notoriously ineffective. Fortunately the healing forces of nature usually bring spontaneous cure, at least of petit mal and myoclonic epilepsy, but this distant prospect is of no great comfort to parents who find the educational and social progress of children blocked by attacks which recur many times a day every day. Fortunately a new medicine, 3,5,5-trimethylxazolidine-2,4-dione, promises relief to many of these patients.

The following therapeutic agents have been used for petit mal with varying, but usually disappointing, results:

Acidosis, however induced, tends to inhibit the three per second dart and dome dysrhythmia and the accompanying petit mal or myoclonic seizures. A relative acidosis is most easily and cheaply induced by activity of muscles and of the brain. Petit mal seizures are relatively frequent during periods when body and brain are idle.

Ketosis, produced by means of a ketogenic diet, has been of distinct benefit to a minority of patients with petit mal, though if attacks are frequent freedom may be short lived. The unpleasantness of the diet and the labor involved have interfered with its wider use. Why certain patients should be free of petit mal with ketosis and others in no way affected is unexplained.

Diphenylhydantoin (phenytoin) sodium, in contrast with the dramatic effect on psychomotor and grand mal convulsions, often increases the frequency of petit mal. The evidence in the literature is clouded because of the fact that many authors confuse brief psychomotor seizures with petit mal.

Phenobarbital is sometimes of temporary or partial assistance in control of petit mal, but in developed cases such control may last only a few days or weeks. A third of one group of patients was seizure free after phenobarbital narcosis maintained for ten days. However, subclinical seizure discharges remained.⁶

Mebaral (methyl ethyl phenobarbital) in my experience has been rather more effective than phenobarbital, but here again benefit is usually only partial or short lived.

Amphetamine (benzedrine), or Dexedrine sulfate, combined in most cases with phenobarbital, stopped the petit mal in 17 of a group of 33 uncomplicated cases.⁷

Glutamic acid has received more attention in popular than in medical journals. The one medical report details improvement in 6 patients whose regular therapy was supplemented by from 12 to 20 Gm. of glutamic acid.⁸

Caffeine used alone for petit mal has not, I believe, been previously reported. One of our adult patients with incapacitating frequency of myoclonic shocks ascertained for himself that he could secure relief only by drinking from five to ten cups of coffee daily. We corroborated this by observing that the frequent spike and wave discharges of the electroencephalogram disappeared during and after the intravenous injection of 0.5 Gm. of caffeine with sodium benzoate. Caffeine either in tablets or as coffee given to a number of patients with petit mal has somewhat ameliorated the frequency of attacks in about one half; others have not been helped or have experienced insomnia or increased nervousness, which precluded continued use. In 1 adult patient having from ten to one hundred petit mal seizures daily, not

Fig. 4.—The uppermost tracing, A, is a sample of the electroencephalogram of patient L. B. Her very frequent myoclonic and kinetic seizures had been absent for several months on Tridione therapy, yet this peculiar seizure discharge, several dart and dome formations, preceded and followed by a short series of high voltage slow waves, recurred every ten to twenty seconds. The lower two tracings are of patient J. S. The upper tracing, B, taken before Tridione therapy was begun, is the beginning of a clinical petit mal seizure which occurred after fifteen deep breaths. The bottom tracing, C, taken three months after seizures ceased, showed only high voltage slow waves after twenty deep breaths.

influenced by ketosis or by any of the many drugs tried, caffeine was apparently influential in terminating attacks, absent now for nearly a year.

Tridione, in my experience, has been the most dramatic in its effect of any form of therapy attempted. The drug is 3,5,5-trimethylxazolidine-2,4-dione⁹ and is not as yet on the market. The structural formula is as follows:

Everett and Richards found the compound more effective than diphenylhydantoin or phenobarbital in controlling convulsions induced in animals.¹⁰ Richards and Perlstein¹¹ have used it in athetosis and in various forms of epilepsy. I have made a preliminary report of a group of patients with petit mal.¹² The medicine is dispensed in capsules each containing 0.32 Gm. (5 grains). Doses used varied from 1.0 to 2.0 Gm. (15 to 30 grains) a day without much regard for age.

During the past fifteen months I have given the drug to 120 patients, both children and adults. Attention has been concentrated on patients whose seizures were predominantly petit mal, myoclonic or akinetic. The fact that seizures in these patients occurred many times every day permits a quicker judgment of results than with other types of seizures which may recur at intervals of weeks or months.

RESULTS

A detailed record of results will be presented elsewhere, but observations to date justify a general statement together with a few case histories. Because of the fact that these three types of epilepsy often disappear spontaneously, results of treatment must be judged more critically than with other forms of seizures. However, there is nothing in the literature of epilepsy which would prepare one for an abrupt decrease or wiping out of these seizures in a period of days or weeks. Even more surprising, in view of our experience with other anticonvulsants, would be the failure of seizures to return promptly when the medicine is discontinued.

Fifty patients each having many daily seizures, either petit mal, myoclonic or akinetic, have been under treatment with Tridione for from two to fifteen months. In a group of 40 patients 10 had a history of grand mal also, but these had been few and were of minor importance. Twenty-eight of the 40 patients had petit mal only. Six had myoclonic or akinetic seizures in addition, and 6 had one or both of these types without petit mal. All but 4 of the patients were less than 20 years of age. The duration of the illness was from one to eighteen years. Seizures recurred from several to scores of times daily, with remissions of no more than a few days. The total number of seizures experienced by individuals ranged from approximately 200 to something like 200,000. Electroencephalograms of all patients contained spike and wave discharges. Practically all of the group had been given the usual anticonvulsant drugs without important benefit. The Tridione was substituted for whatever drugs were being used. In no case was the transfer accompanied by an increase of petit mal.

Of this group of 40 patients 11 (28 per cent) now are free from petit mal, myoclonic or akinetic seizures and 21 (52 per cent) have experienced a 75 per cent or greater reduction in the number of seizures from the previous level. Ten (20 per cent) were helped only moderately. None failed to experience some amelioration of seizures. Therapy was discontinued in 2 cases because of toxic symptoms and in 2 others as a trial of results. Three of these have had no return of symptoms in the two to four months which have lapsed. Remissions of such duration were entirely unexpected in the light of experience with grand mal or psychomotor seizures, which recur promptly if medication is not continued for many months after seizures have ceased. Evidently petit mal seizures have a hair trigger mechanism which can be blocked relatively easily if the proper agent is used. The maximum reduction in seizures in most cases occurred in from one to three weeks. In several cases there might remain a small residuum which continued in spite of increased dosage or which disappeared after two or three months.

A second group of 10 patients, in addition to frequent daily petit mal seizures, experienced frequent grand mal seizures. Results with this group were encouraging as regards disposal of petit mal but disappointing as regards grand mal. In each instance petit mal seizures ceased or were decidedly lessened. However, the dose of Tridione which proved effective against petit mal was without influence against grand mal. Indeed, some of these patients had an unwonted number of major seizures, due possibly to stopping other medication, and in none of this group was medication continued. Diphenylhydantoin sodium oftentimes increases the frequency of petit mal. Whether Tridione can profitably be combined with diphenylhydantoin or phenobarbital in the treatment of patients who, in addition to one of the petit mal triad are having frequent or persistent grand mal seizures, requires further experience. Certainly, patients having petit mal, myoclonic or akinetic seizures as their major problem are the most likely to benefit from this new medicine. My observations do not warrant statement regarding the effect of Tridione on patients having grand mal or psychomotor seizures not complicated by petit mal. In addition to the 50 patients 13, because of side effects or an immediate increase of seizures, did not continue medication the required two months.

The following cases are representative of the results observed:

N. Y., a girl aged 17 years, with an intelligence quotient of 138, began to have petit mal seizures six and one-half years ago. They recurred frequently, often scores of times a day. Phenobarbital and diphenylhydantoin sodium were without effect; glutamic acid was of transient benefit; mebaral gave freedom for three weeks, and caffeine for a shorter period. Tridione was begun July 1, 1944. By the end of two months a petit mal seizure was observed only about once a week. After another four months the seizures had disappeared and have been absent for seven months, during the last four of which Tridione has not been used. Electroencephalograms before treatment always contained several larval petit mal discharges and a prolonged petit mal with overventilation. Six months after cessation of seizures there was only a high voltage slow wave discharge with hyperpnea.

L. B., a girl aged 3½ years, born after prolonged labor and version, progressed normally till 15 months, when she began to have several rhythmic jerks of the legs whenever she fell, or her eyelids would blink rhythmically at a loud noise. A month before she was seen she began to fall frequently without reason. On phenobarbital these symptoms were absent for three days and then came more frequently, until they recurred from

fifty to two hundred times a day. Twenty-four hours after Tridione was first given (1.0 Gm. a day) attacks ceased for two months. They then began to return. Medication was increased to 1.3 Gm. a day. In the four months which have intervened akinetic seizures have been absent, the mentality, which is retarded, has improved a bit and behavior is better. In spite of the clinical improvement the electrocardiogram continues to have frequent discharges of high voltage three per second waves with occasional spikes interspersed (uppermost tracing of figure 4).

J. S., a boy aged 11 years, with an intelligence quotient of 136, had falling episodes at 3 years and at 5 years began to have petit mal seizures with increasing frequency up to twenty to thirty a day. Enuresis occurred with some. During the past six months he had occasional days of being confused, when he was able to eat but not to converse, i. e. periods of petit mal status. There had been six grand mal seizures. Phenobarbital, mebaral, diphenylhydantoin sodium, amphetamine and caffeine had been used without more than transitory benefit. Tridione, starting with 1.0 Gm. daily, was increased to 2.0 Gm. Petit mal seizures had disappeared in two months and have been absent for eight months, the last six of these without medication. Before treatment electroencephalograms yielded symptomatic petit mal both spontaneous and after overventilation and also a shifting focus of single dart and dome discharges. Five months after cessation of attacks the record yielded no discharges (two lower tracings of figure 4).

G. W., a girl aged 9 years, with an intelligence quotient of 130, had ten to twenty petit mal seizures daily for eighteen months without interference from phenobarbital or mebaral. The electroencephalogram contained two eight second periods of petit mal discharges and many single high voltage three per second waves. Petit mal seizures ceased about ten days after medication was begun and did not reappear during a severe attack of measles. An electroencephalogram made after three months of freedom was essentially normal. Behavior also was much improved.

W. McN., a boy aged 10 years, had had petit mal seizures ten to thirty times daily, accompanied by coarse clonic movements of the arms for three and one-half years. Seizures were easily precipitated by overventilation. Phenobarbital, diphenylhydantoin sodium and glutamic acid were without effect. Petit mal seizures ceased several weeks after Tridione therapy was commenced, but five days later medicine was stopped because of vomiting. Seizures were entirely absent for four months, then returned with their former frequency but without the accompanying clonic movements. Medication was resumed, and attacks again ceased after several weeks.

G. W., a boy aged 12 years, with an intelligence quotient of 112, had occasional grand mal seizures, held in check by diphenylhydantoin sodium, and myoclonic jerks evidenced by a single sharp cry. These recurred several times a day and had not been helped by phenobarbital or diphenylhydantoin sodium. His electroencephalogram contained a few single wave and spike discharges. For three months after starting Tridione he did not have a single cry, but grand mal seizures returned and became more frequent in spite of phenobarbital medication. For this reason Tridione was stopped and diphenylhydantoin reinstated.

These encouraging and dramatic results are only the immediate results of therapy. Time must tell the long term effects, either of therapeutic results or of side-effects. We hope for the disappearance not only of clinical symptoms but also of the underlying dysrhythmias. On this point observations to date are encouraging but inconclusive.

SIDE-EFFECTS

Unpleasant side-effects of Tridione therapy have been various. In several cases skin rashes caused discontinuance. Gastric disturbance has not been prominent, nor has drowsiness. A more difficult and surprising side-effect has been an unusual sensitivity of the eyes to bright daylight. This was noted by the majority of

adolescent or adult patients but only rarely by young children, although children received much larger doses per pound of weight. The symptom has not been attended by any decrease in visual acuity when indoors or alteration in the appearance of the retina or other structures of the eye. Continued use of the medicine has not caused progressive increase of photophobia, which disappears a week or ten days after the medicine is stopped. This subject is being investigated. The possibility that therapy need not be continued indefinitely minimizes anxiety regarding unpleasant chronic side-effects.

What might be called pleasant side-effects have been improved appetite and gain in weight by some patients. In others the disappearance of clinical symptoms has been marked by an improvement in the school performance or in the deportment of the child.

COMMENT

Aside from the practical therapeutic effects of Tridione therapy, use of this drug throws light on certain underlying problems of neurophysiology. Traditionally, antiepileptic drugs have been looked for among the sedatives. Yet members of the petit mal triad respond best to caffeine, amphetamine sulfate and Tridione, none of which is a soporific. Because slow brain waves predominate in petit mal, the use of stimulating drugs which increase wave frequency is logical. The clinical antithesis to diphenylhydantoin sodium, which often increases petit mal, is striking.

Possibly the drug acts on the portion of the brain from which the spike and wave pattern arises. Penfield¹³ demonstrated in 1 case that a petit mal discharge originated in the region of the infundibulum. Various bits of evidence suggest that the region of the midbrain may be important for maintenance of postural control and of consciousness. Without any doubt, Tridione is a most useful and interesting drug which will repay careful study.

CONCLUSIONS

Seizures with divergent clinical appearances, petit mal (pyknopilepsy) and myoclonic and akinetic epilepsy have two important characteristics in common: first, the alternate spike and wave pattern of the electroencephalogram, and, second, lack of benefit from the usual anticonvulsants but positive benefit from the use of a medicine not yet on the market 3,5,5-trimethyl-oxazolidine-2,4-dione (Tridione).

This medicine was given to a group of 50 patients subject to frequent daily petit mal, myoclonic or akinetic seizures not helped by previous medication. In 40 of the patients grand mal seizures, if present, were of minor importance. In a period of days to weeks the offending minor seizure ceased in 28 per cent, were reduced to less than one fourth of the usual number in 52 per cent, and were little affected in 20 per cent. In several patients seizures once stopped did not return when medication was discontinued. In 10 other patients the daily petit mal seizures were of less importance than frequent grand mal. In these Tridione stopped or lessened petit mal but proved ineffective against the grand mal seizures or even increased them.

The principal side-effect was photophobia, which affected older children and adults more frequently than the young. These observations extend over a period of fifteen months. Final evaluation of therapeutic and side-effects must await a wider and longer experience.

ABSTRACT OF DISCUSSION

DR. ERNST WOLFF, San Francisco: Dr. Lennox's paper is of extreme interest to the practicing pediatrician for many reasons. It demonstrates in the most lucid manner the work of Dr. Lennox and his associates in establishing the differential diagnosis of seizures in childhood by means of characteristic patterns of the electroencephalogram. This fact alone restores our confidence in a method of examination which heretofore did not give us sufficiently reliable help in differential diagnosis, especially in the separation of functional from organic conditions in childhood. The therapeutic effect of Tridione in the series of cases presented is most impressive. Especially interesting is the fact that the drug needs only to be given temporarily to produce lasting effects in some cases, though this fact naturally must be definitely established by a follow-up period of longer duration. Children with seizures have great difficulty in attending schools regularly, even when under treatment with the best known drugs hitherto available. Should its effectiveness become permanently established, we may hope that Tridione will normalize the education of these unlucky patients. Since many such children have normal or high intelligence levels, good school opportunities can be a big factor in their happiness and emotional stability, not only for them, but for their families as well. A drug which will be effective against childhood seizures will drive away the clouds from many homes.

DR. M. G. PETERMAN, Milwaukee: The forms of epilepsy specified include the most baffling in this disease entity. A new drug is most welcome in the treatment of these symptoms. In my experience the akinetic form of epilepsy occurs mostly in infants and is highly resistant to all treatment. It is usually rapidly progressive and often fatal. I have seldom seen spontaneous recovery. All epilepsy must have a basic cerebral pathologic form because the electrogram consistently indicates an abnormality or dysrhythmia. Pyknopsy or pyknopsylepsy was most completely described by Friedmann and by Heilbrunner. With Lennox I am unable to make a differentiation of this form of attack from petit mal epilepsy. However, I cannot be as sanguine about the spontaneous recovery. I would agree with Penfield and Erickson, who stated that "spontaneous remissions do not occur in more than 2 or 3 per cent." However, later in their book they qualify this statement considerably. Many children with petit mal attacks eventually develop grand mal seizures. I have also studied the intelligence quotient of my patients with petit mal. In 1927 I reported that these patients rated high in mental ability and were usually superior to their siblings. Eventually, however, mental deterioration does appear. Contrary to Lennox's experience, I find that fasting and subsequently a ketogenic diet, which maintain a constant hypoglycemia, rather promptly control the attacks in over one third of the patients. I have used Brain's hyperpnea test since it was described in 1924 and find that it will usually precipitate a petit mal seizure in the potential patient. It is very useful to produce the electrogram changes described by Lennox. The most effective treatment yet introduced for petit mal is the ketogenic diet. Some authors referred to the results with dilantin as a "miracle" and others stated that "petit mal attacks responded better to diphenylhydantoin than to other forms of treatment." Others report that "seizures were reduced in 59 to 84 per cent" of their patients. This is obviously not true, as Lennox states, but it has cruelly stimulated the hopes of the patient and his relatives. For many years and after an adequate trial of dilantin I have insisted that this drug and all others have no value in the treatment of petit mal. Recently even Lennox questioned whether "the patients or the author were resistant to dilantin sodium." I am pleased to read Lennox's conclusions regarding this drug. He has also effectively disposed of glutamic acid. The use of caffeine for the treatment of petit mal was reported among others by Karger in 1919. I found it to have no definite effect.

EARLY FILARIASIS IN YOUNG SOLDIERS

CLINICAL AND PATHOLOGIC ANALYSIS

MAJOP KENNETH J. THOMPSON

MEDICAL CORPS, ARMY OF THE UNITED STATES

MAJOR HAROLD RIFKIN

MEDICAL CORPS, ARMY OF THE UNITED STATES

AND

LIEUTENANT MEYER ZARROW

SANITARY CORPS, ARMY OF THE UNITED STATES

With the onset of war filariasis, known chiefly to tropical medical practitioners, became a disease to be recognized and managed by medical officers, and in the future by civilian physicians. The disease was formerly recognized by its elephantoid character in the late stages. With the onset of war, military and naval personnel residing in filarial endemic areas contracted the disease and developed new and hitherto unrecognized clinical manifestations. Sporadic reports of early filariasis have appeared of recent date in the literature. King and Wartman¹ discuss the clinical and pathologic manifestations of early filariasis in a group of soldiers residing in the Samoan Islands. Michael² describes a similar picture among naval and marine personnel, who have been evacuated to state-side naval hospitals. Zuckerman and Hibbard³ have described changes occurring in the lymphatic tissues of patients infected in the South Pacific Islands. Rifkin and Thompson⁴ describe their observations on structural changes occurring in lymph nodes and lymphatic vessel biopsies from a group of 30 soldiers who resided in filarial areas for an average period of one year. They further stress, with Michael² and Zuckerman,³ the allergic nature of the disease during its early and acute phase. Pasternak⁵ has described the clinical findings and the morphologic features in 2 cases of acute filarial epididymofuniculitis. Sapero,⁶ describing epidemic diseases in the early phases of the war, stresses the importance of early recognition of filariasis. Manson-Bahr⁷ and O'Connor and Hulse⁸ have described the clinical and pathologic findings of filarial disease in natives. Their brilliant work, we feel, is however not directly associated with the type of disease we have seen in military personnel.

In the last two years an attempt has been made by us to delineate the underlying changes occurring in the early stages of the disease. A clinicopathologic concept of early filariasis has been developed as a result of prolonged clinical observation of the patients, correlation with the histologic findings from representative biopsies of lymph node and lymphatic vessels, and observations of a skin test utilizing titer dilutions of *Dirofilaria immitis* as an antigen. It is felt that this is important to the internist and general practitioner in his differ-

ential diagnosis of lymph node enlargements, to the urologist for his distinction of filarial epididymo-orchitis, to the general surgeon for his differential diagnosis of filarial lymphangitis and filarial abscesses and for his proper selection of node biopsies and finally to the pathologist for his recognition and appreciation of another endothelial granuloma.

In examining a group of 200 patients infected with filariasis, it became evident that there was no one symptom or sign that was constant in every case. All patients fell into one of the following general groups:

1. The first group comprises patients in whom the predominating finding is an acute lymphangitis involving the upper or lower extremities, sometimes both, either unilateral or bilateral. There may be a history here of one to several attacks.

2. The chief complaint in the second group is an acute funiculitis or epididymitis. The attacks here may be single or multiple. With repeated attacks the cord structure may be involved first on one side and then on the other. A bilateral involvement has been noted in an occasional case. In the main, the attacks usually confine themselves to one side.

3. The third group usually give a past history of an acute episode of lymphangitis or funiculitis one to eight months prior to hospital admission. On examination they usually have no complaints or clinical findings with the exception of a generalized lymph node enlargement.

4. In the fourth group the patients usually complain of an aching, tiring extremity, frequently associated with malaise, weakness and fever. There may or may not be history of an acute lymphangitis. Generalized lymph node enlargement is always present.

5. The fifth is a large group of patients who have had no clinical findings suggestive of the disease but who have resided in endemic areas and who give a positive skin reaction to *Dirofilaria immitis* antigen in dilutions varying from 1:4,000 to 1:16,000. On physical examination they present generalized lymphadenopathy.

6. In the sixth and final group the patients show intermittent swelling of the extremities. This is usually associated with a past history of an acute lymphangitis.

It is to be especially noted that all six groups have one finding in common, namely persistently enlarged and palpable lymph nodes. Those patients who have recently had lymphadenitis or funiculitis will usually show larger or softer feeling nodes. These are usually tender to palpation. As the disease progresses the nodes are likely to become smaller and have a firm and brawny feel to the palpating finger.

With such a varied clinical picture it was impossible to determine accurately whether a given patient had actually been infected with the disease or not. It was decided, therefore, to take complete and accurate clinical histories of each suspected patient. On these patients a careful laboratory work-up was performed. This included complete blood counts, study of peripheral smears for eosinophils, stool examinations, skin testing with a *Dirofilaria immitis* antigen in titer dilutions and, finally, biopsies of focal lymph nodes or lymphatic channels. As a result of correlation of biopsy studies and clinical findings, a concept and classification of the disease soon began to develop. At the present time we feel that there are three stages in early filariasis, namely the acute stage, the early subacute stage and the late subacute or early chronic stage of the disease. The typical morphologic findings in these phases of the

disease have been described in full in a report by Rifkin and Thompson.⁴

A word about biopsies: All biopsies have been taken from superficial lymphatics or lymph nodes. In the cases of acute lymphangitis, a thickened lymphatic channel can usually be palpated. Section of this structure will usually show the characteristic morphologic findings. Where funiculitis is a primary feature, biopsy specimens should be secured from the pampiniform plexus. This means more than exposing the dartos muscle. The muscles must be dissected from the cord and the actual section taken from the plexus. This is performed under local anesthesia by isolation of a small segment of the plexus, ligating above and below and removing the intervening segment. If the case is one of acute filariasis, the plexus and the structures of the cord are edematous and thickened. The individual lymphatics stand out, giving the impression of a strand of vermicelli macaroni. In cases of funiculitis and epididymitis there will often be enlargement of the inguinal nodes, and particularly of the node over the fossa ovalis. During the course of an examination this node should always be palpated. Biopsy of an enlarged node from these areas will reveal typical microscopic pictures and frequently the actual parasite. In addition to the enlarged regional nodes, one not uncommonly finds enlarged parafoveal bizarrely placed nodes. These, on biopsy, may show the microscopic picture of filariasis. From our experience the axillary nodes are more likely to show positive microscopic findings than the inguinal nodes. There is always a temptation to remove an inguinal node which is suspiciously enlarged because of its easier accessibility. The indiscriminate taking of biopsies will often lead to disappointment. In general, the node nearest the site of involvement should be taken. Further, if an acute lymphatic channel or a bizarrely placed lymph node can be palpated, these should be selected for biopsy. As has already been mentioned, the disease is believed to be systemic in nature. It is felt that the disease during its early acute manifestations is of an allergic nature, and as a result the lymphatic tissues throughout the body exhibit follicular hyperplasia associated with edema and eosinophilic infiltration of lymphatic channel walls and node structure. It is possible in this particular phase to remove a node or lymphatic vessel which is not the primary focus but which may still retain the characteristic findings of the acute allergic phase. It must be cautioned, however, that this occurs only during the acute or acute exacerbating phases of the disease.

Little is to be learned from incidence of primary involvement of the various lymph nodes. The nodes and structures selected for biopsies were 41 inguinal nodes, 9 axillary nodes, 18 epitrochlear nodes, 6 bizarre nodes, 11 pampiniform plexuses and 5 nodes over the fossa ovalis.

In 30 cases biopsies were taken from more than one lesion. Such combinations included right axillary and left inguinal nodes, left epitrochlear and right axillary nodes and sections from the right pampiniform plexus and left inguinal nodes.

As already stated, it appears that early filariasis may be divided into three phases, namely the early acute or allergic phase, the subacute phase, and the early chronic phase of the disease. There is no classification which can sharply delimit and define clinical medicine. In the main, however, it will be seen that patients infected with filariasis will fall into one of the categories to be described.

CLINICOPATHOLOGIC STAGE OF DISEASE

(a) *Acute Stage*.—This stage is commonly characterized by a sudden onset of lymphangitis with pain and swelling and enlargement of regional lymph nodes. The lymphangitis is usually fleeting in its duration, lasting in many instances three to four days and beginning to fade in twenty-four hours. The lymphangitis is peculiar in that it does not resemble the septic or bacterial variety. There is little fever, the temperature usually ranging from 99 to 100 F. Constitutional symptoms are rare. With the exception of slight malaise, no other symptoms are usually noted. A striking finding is the occurrence frequently of a centrifugal or retrograde lymphangitis. It will sometimes occur in the upper arm and work its way to the wrist. The general type of lymphatic infection extends in the direction of the lymph flow. Further, some patients may develop several attacks of lymphangitis recurring over a period of eight to nine months. Other cases may exhibit only an initial attack of lymphangitis and then progress into the subacute or late phase. In a number of cases there may be no history of an acute lymphangitis.

Not uncommonly in the acute stage of the disease one will encounter the enlarged bizarrely placed lymph nodes. There is no particular location for these lesions. They are not uncommonly found at the tip of the ileum, in the midarm and in the region of the teres and serratus muscles. This type of gland is not usually found in the true bacterial lymphangitis. In addition to these bizarrely placed lymph glands one can frequently palpate discrete lymphatic channels during the time when the lymphangitis is at its height.

There is a high incidence of funiculitis and epididymitis. Approximately one half of the patients complain of pain and swelling in the region of the cord or epididymis. The patients usually complain of pain and heaviness in the testicles of several days' duration, followed by enlargement. The enlargement may be minimal or the testicles may enlarge two to three times their average size. The condition is usually unilateral, although a second attack may involve the opposite side. For the most part, one side is usually selected. The funiculitis or epididymitis may subside quickly, within a matter of a few days, similar to that of the lymphangitis of the upper or lower extremity. Accompanying the enlargement of the cord there is commonly found a small hydrocele and frequently a brawny, edematous feel to the scrotum. The inguinal glands are slightly enlarged. There is no mistaking the typical feel of the structures of the cord. The cord itself sometimes becomes as large as the thumb, and the vas may be as thick as a lead pencil.

With the acute lymphangitis, whether it is in the arm, in the leg or in the structures of the cord, there is always associated a lymphadenitis. The lymphadenitis is not distinctive of the acute stage but is common to all stages of the disease. In addition to enlargement of the nodes, one will often find distantly placed enlarged lymph nodes. The one feature of these nodes, which may be considered characteristic of the acute phase of the disease, is that they are often larger and softer feeling than those of the later stages.

Not infrequently, try as hard as one may, one cannot obtain a history of acute lymphangitis or funiculitis. Yet on the removal of an involved node one may find the typical morphologic findings of the acute phase of the disease. The only explanation offered for this is that the patient may have built up an immunity to

filariasis, or he may have been unobservant of his very early and sometimes minimal lymphangitis.

The laboratory findings are much the same: negative filarial blood smears, positive skin reactions in dilutions of 1:4,000 or higher, slight to moderate eosinophilia, white and red blood cell counts not remarkable. Knott's concentration smears have been run on all patients. We have been unable to demonstrate the microfilariae in the blood stream. The literature records 2 cases of positive blood smears in young soldiers infected with the disease.⁹

The pathologic findings of the lymph nodes in the acute stage are characterized by hyperplasia of the lymph follicles, eosinophilic infiltration throughout the node and edema. The cells are true eosinophilic leukocytes. The stain is constantly acidophilic. The nuclei are either bilobed or trilobed. The edema is denoted by the presence of a pink staining albuminoid fluid in the afferent and efferent lymphatics. It is interesting to note that in many cases the macrofilariae with their double contoured uterus are visible. In other nodes, worm segments or microfilariae are evident. The reaction is the same whether the worms are present or absent. Two theories are postulated regarding the absence of worm foci and a positive morphologic reaction. First, there is possibly disintegration of a previously existing worms or worm focus; second, the node is not the primary focus but one which shares in the general systemic reaction.

The morphologic findings in an acute filarial lymphangitis consist chiefly of thickening, edema and eosinophilic infiltration of the lymphatic wall. The lumen is occupied by an acute thrombus in which the eosinophils have become pyknotic and aggregated themselves into a necrotic amorphous mass. In some cases it is possible to note worms, worm segments or microfilariae. In the larger majority of cases, however, these are usually absent and the diagnosis is made chiefly on morphologic grounds. It has been possible to examine lymph nodes far removed from the actual source of infection which show the characteristic reaction. There is no evidence here of macrofilariae or microfilariae. Examination of superficial lymphatic tissues which do not appear to be clinically involved reveals moderate eosinophilic infiltration of their walls with a pink-stained edema fluid within the lumen. This we believe offers one bit of evidence toward a generalized systemic nature of the disease process.

(b) *Subacute Phase of Early Filariasis*.—In contrast to the acute lymphangitis, the patient will often complain of a heaviness, tiredness and aching of the involved part, and oftentimes there is little clinical evidence of the disease. Lymphangitis, swelling or edema is not noted. Occasionally there may be a history of mild recurrent attacks of edema, fleeting in nature, and often following heavy physical exertion.

Often the only objective findings are some small regional nodes, perhaps a bit more firm than usual. At times they may be almost shotty-like, while in the allergic phase the nodes will be definitely enlarged and succulent. At this time there are no bizarrely placed groups of glands nor are there any swollen, enlarged lymphatic channels. The glands would almost invariably be overlooked if it were not for the history of residing in filarial areas or a history of an acute episode.

This stage is represented histologically by a proliferative granulomatous reaction present within the lumen of the lymphatics, involving the wall of the lymphatics and the lymph node structure. Here one sees a macrophagic proliferation, with the formation of small epithelioid cell foci throughout the lymph cords and infiltrating the walls of the lymphatics and involving the periglandular connective tissue. It is possible in some cases to see persisting eosinophils associated with aggregates of macrophages. Actual epithelioid cell tuberculoid foci are noted, the center of which may be occupied by a degenerating microfilaria, which in turn is surrounded by epithelioid cells embedded in concentric laminae of collagenous tissue. At the periphery, accumulations of lymphocytes and plasma cells are noted. In some nodes the worms have undergone complete necrosis and cannot be recognized. Here the central zone consists of a pink-red staining caseo-necrotic material with radially arranged macrophages. This has an almost identical appearance to a true tubercle. We have classified these lesions as tuberculoid focal granulomas. The lumens of the lymphatics show partial to complete occlusion by a similar infiltrate of epithelioid cells and round cells. The endothelial lining may show a severe degree of irregular stratification, protruding in uneven fashion into the lumen as a cellular thrombus. The walls of these lymphatics are thickened by a similar macrophagic overgrowth. Concentrically arranged around the wall are usually noted accumulations of epithelioid cells with clear reticular cytoplasm, vesicular nuclei and light staining nuclear membranes. We subscribe to the terms of epithelioid cell endolymphangitis and perilymphangitis first utilized by Hartz.¹¹ It is of interest to note that the periphery of these tuberculoid granulomas may be occupied by accumulations of spindle shaped fibroblasts. This marks the end stage of the subacute phase of early filariasis or the beginning of the early chronic phase of the disease.

(c) *Late Stage of Early Filariasis.*—Finally there is the so-called "late stage," which is merely a progression of the previous two phases. We have seen 10 typical cases of this stage, and it might be termed the beginning of the chronic stage of the disease. However, we have no way of telling what the future progress of the patients will be. None have shown the microfilariae in the blood stream nor have they shown the infective type of lymphangitis belonging to the chronic elephantoid stage. The cases in this stage may go on to complete subsidence with disappearance of the symptoms.

The late stage of early filariasis occurs at a variable time following the onset of the early allergic phase. The only clinical manifestation is a chronic swelling with increase in size of an extremity, with or without pitting edema. Accompanying this there are complaints of tiredness and aching of the extremity.

It might well be argued that this late stage is really chronic filariasis and has no part in the discussion of the acute disease. We have observed it within twenty months after exposure; it has no distinct microscopic picture and clinically lacks many of the features of the chronic elephantoid stage of the disease as described in textbooks.

Histologically there is no distinct pattern, so that one cannot definitely denote the lesion as being a specific for filariasis. The predominant findings consist of a

generalized reticuloendothelial hyperplasia with irregular areas of fibrosis. The lymphatics in the periglandular connective tissues, as well as the superficial lymphatics, show the replacement of a cellular infiltrate in the lumen and walls by a fibroblastic ingrowth. Here the lymphatic vessels may be reduced to a fibrous cord with its lumen hardly recognizable. Zuckerman aptly refers to such a lesion as an obliterative endolymphangitis.

SKIN TESTS

We have utilized a *Dirofilaria immitis* antigen prepared according to the method of Dickson, Huntington and Eichold¹² with certain modifications. Complete details on the procedures and our results have already been published by Zarrow and Rifkin.¹³ Briefly, the method of preparation is as follows: Dogs are killed by an intravenous injection of magnesium sulfate and their hearts removed. An incision is made into the right ventricle and auricle, and the adult worms are removed and placed in isotonic solution of sodium chloride. The worms are washed overnight in running water and treated with several changes of acetone. Following this they are thoroughly dried and a powder is then prepared. Extraction is then made as a 1 per cent suspension in isotonic solution of sodium chloride. This was sterilized by Seitz filtration with the addition of phenol. From a stock extract, dilutions of 1:200, 1:2,000, 1:4,000, 1:8,000 and 1:16,000 were made. Owing to the fact that the extracted material will lose its potency, the dried powder was maintained as a stock source and new dilutions were made every month. A volume of 0.05 cc. was injected on the volar surface of the arm. Dilutions of 1:2,000, 1:4,000, 1:8,000 and 1:16,000 were utilized. A control was injected, which consisted of a fragment of heart muscle which had been treated identically as the antigen. Readings are taken after thirty minutes and twenty-four hours. A positive reaction is considered as a definite increase in wheal size over the control plus an erythema measuring 2 cm. in diameter after thirty minutes.

In an attempt to determine the specificity of the *Dirofilaria immitis* antigen in the skin test, it was possible to compare results of lymph node biopsy with results of skin tests. In a control group of 53 patients suspected of clinical filariasis, 60 per cent were proved to have this disease on biopsy. In this same group 73 per cent gave a positive reaction to a titer of 1:4,000 or higher. In 3 cases a positive biopsy was obtained with a negative skin test. The desensitization has been noted previously by Dickson and his associates¹² and appears to be a true factor and not due to loss of extract potency. In a separate series of 91 patients with clinical symptoms of filariasis, 94 per cent gave a positive response to a dilution of 1:4,000 or above. Biopsies were not performed on this group.

It has been claimed that patients with intestinal helminthiasis are sensitive to intradermal injections of *Dirofilaria immitis* antigen. A series of 65 patients, all free of clinical filariasis, were injected with the antigen. These patients harbored hookworm, *Strongyloides stercoralis*, *Ascaris lumbricoides*, *Enterobius vermicularis* and *Hymenolepis nana*. With one exception no positive reaction was obtained with a dilution of 1:2,000 or higher. This patient had clinical herpes

zoster. It is felt, therefore, that a titer of 1:4,000 or higher of a nonspecific *Dirofilaria immitis* antigen is diagnostic of filarial infection in human beings.

LABORATORY DATA

Complete blood counts were performed on all patients. The red blood cell counts and hemoglobins were within normal limits. Neutrophils, monocytes and lymphocytes showed no aberration. Seventy-five per cent of the patients gave a white blood cell count between 7,500 and 8,500. Twenty-five per cent gave an elevation to 10,000. Of the entire group 34 per cent showed an eosinophilia. This never went higher than 28 per cent. The average was maintained from 10 to 15 per cent. In the latter group intestinal helminths were found in 15 per cent.

CASE HISTORIES

CASE 1.—*An acute filarial reaction in an involved lymphatic.* A white soldier aged 22 entered the hospital eighteen months after his first possible exposure to filariasis. The history revealed that ten months after arrival in an endemic filarial area the patient developed an epididymitis and funiculitis on the right side. The right testicle became swollen to twice normal size, and the right cord was likewise enlarged and tender. The acute symptoms subsided in fifteen days. However, since the original onset the right cord structures had remained slightly larger than the left, and the patient had complained of a mild pain in the right testicle. Four days before entry to the hospital the right cord again became tender and swollen. Examination showed the right cord structures to be three times normal size. The vas could be palpated as pencil in size; the epididymis was large, boggy and tender. The left cord and epididymis were normal. A moderately enlarged right inguinal gland was palpable. The right axillary glands were enlarged, nontender and freely movable. Laboratory examination revealed the skin test positive in 1:4,000, stool normal, Knott concentration tests negative for microfilariae, white blood cells 8,600, eosinophils 8 per cent. A section of the right pampiniform plexus was removed for biopsy.

Microscopic examination revealed lymphatics the lumen of which was filled with a cellular thrombus consisting of eosinophilic leukocytes, epithelioid cells, broken-down red blood cells and cellular debris. The wall was intensely hyperplastic and was infiltrated with large numbers of mature eosinophilic leukocytes, epithelioid cells and young spindle shaped fibroblasts. An interesting feature was the presence of a small pyknotic, eosinophilic tubercloid focus at the periphery of the cellular hyperplastic wall. A section of this tubercle consisted of necrotic pink-staining; debris surrounded by aggregates of eosinophils and epithelioid cells. Giant cells were not visible. There was 1 lymphatic present, in which there was a small cellular focus consisting of fibroblasts, lymphocytes, plasma cells and epithelioid cells covered partially by a thin endothelial membrane. This projected into the lumen as a true endolymphangitic thrombus. The periphery of the wall was infiltrated with a similar type of cells.

CASE 2.—*A proliferative granulomatous reaction, subacute phase.* A soldier aged 23 with thirty-one months of overseas duty entered the hospital complaining of enlargement of the right arm and forearm of three days' duration. The history revealed that the patient had spent twenty months in a filarial area. During this time there had been several minor attacks of pain and swelling in the right arm, though there was no definite history of lymphangitis. The right epitrochlear gland was not palpable. The axillary glands were enlarged, moderately firm and freely movable. There was no other glandular enlargement. The epididymis and cord, right and left, were normal. Laboratory examination revealed Knott concentration smears negative for microfilariae, white blood cells 8,200, eosinophils 10 per cent, and stool normal. A left axillary gland was removed for biopsy.

Microscopic examination revealed extensive hyperplastic reaction of the lymph follicles. The germinal centers shared most prominently in this reaction. They were filled with lymphocytes, plasma cells, mononuclear histiocytes and small numbers of epithelioid cells. Present in the cortical sinuses were small numbers of epithelioid cells having a clear reticular cytoplasm containing vesicular or bandlike nuclei with a distinct nuclear membrane. Within a small number of germinal centers were multinucleated giant cells. Present in one area were four caseating tubercloid foci. These tubercles consisted of a central amorphous caseating mass, which was surrounded by palisades of epithelioid cells. Between and surrounding these epithelioid cells were large numbers of lymphocytes, plasma cells and small numbers of Langhans giant cells. The afferent lymphatics and intermediate sinuses gave a typical epithelioid endolymphatic and perilymphatic granulomatous reaction. Careful search through the entire node revealed no evidence of microfilariae or microfilariæ.

CASE 3.—*The subacute phase with an acute exacerbation.* A soldier aged 23 had spent twenty-eight months overseas, twenty-three months of which had been spent in areas endemic for filariasis. The patient gave no history of having had any subjective or clinical findings compatible with filariasis until two weeks prior to entry into the hospital. At this time he complained of pain and swelling in the left arm. Examination showed a linear area of redness and swelling in the midportion, volar aspect of the left arm and measuring 5 to 8 cm. There was an enlarged, tender lymph gland in this area. There were a few small, palpable left axillary glands. There was no other glandular enlargement. The laboratory investigation revealed the skin test positive in a dilution of 1:2,000 (no higher dilution was used in this case). Stools were normal, Knott concentration tests negative for microfilariae, white blood cells 7,600, eosinophils 4 per cent. The bizarrely placed gland on the medial aspect of the left arm was removed for biopsy.

Microscopically the most striking change was the presence of small accumulations of epithelioid cells throughout the lymph node. These were found in the cortical follicles including the germinal centers and also in the intermediate sinuses. These cells were irregular in shape, with oval nuclei and distinct nucleoli. Accompanying these epithelioid cells were characteristic foreign body giant cells lying among the epithelioid cells. Small foci of eosinophilic leukocytes were irregularly scattered throughout. A characteristic reaction was found in the sinuses and in the afferent and efferent lymphatics. This was actually a granulomatous endolymphangitis and perilymphangitis. Within the lymphatics and almost completely occluding them were collections of epithelioid cells, lymphocytes and histiocytes, which bore no relationship to the wall of the vessel. These loose connections of cells were occasionally accompanied by foreign body giant cells. In a number of lymphatics, thin strands of pink-staining connective tissue fibers could be observed ramifying in this cellular infiltrate. In one or two afferent vessels, living macrofilariae were observed containing an outer pink-staining cuticle and an inner pink-staining double contoured uterus; within this uterus were deeply basophilic round bodies, which apparently represented primary larval forms. The lymphatics here showed a distinct granulomatous perilymphangitis. These consisted of accumulations of histiocytes, epithelioid cells, lymphocytes and small numbers of eosinophilic leukocytes surrounding these involved lymphatics. The walls of the lymphatics were indented into the lumen and exhibited a piling up of the endothelium. In the surrounding connective tissue small pseudotubercles were visible consisting of a central core of epithelioid cells and an occasional eosinophil; these in turn were surrounded by perifocal early fibrosis. There were one or two areas which contained a distinct pyknotic necrotic central zone in which fragmented microfilariae were visible. These were surrounded by layers of epithelioid cells, eosinophils, lymphocytes and plasma cells. There was one medullary sinus containing a necrotic adult worm which was surrounded by a focal layer of hyalinized fibrotic tissue. In a number of the sections the lymphatics were dilated and filled with thin albuminoid pink-staining material. The endothelial lining here presented scalloping with moderate stratification.

CASE 4.—Primary genital involvement with acute allergic systemic reaction. A soldier aged 21 with a fifteen month overseas tour of duty entered the hospital complaining of pain and swelling of the right testicle of three days' duration. The history revealed that the patient had resided in a filarial endemic area for nine months, at the end of which time he developed pain and swelling of the right cord and epididymis with right inguinal node enlargement. The symptoms subsided in two days. The patient was evacuated to a nonendemic area and remained free from symptoms for nine months. The present attack of pain and swelling of the right cord began three days before entry to the hospital. Examination showed the right cord structures to be enlarged one to two times normal size, the vas being definitely increased in size. The right epididymis was enlarged to twice normal size and the sulcus obliterated. There was a firm mass felt in the right pampiniform plexus just above the epididymis. There was also an enlarged, tender right inguinal gland. The epitrochlear nodes were not palpable. However, the right axillary nodes were enlarged. Laboratory examination revealed the skin test positive in a dilution of 1:16,000, the stools positive for *Endameba coli*, Knott concentration smears negative for microfilariae, white blood cells 9,200, eosinophils 4 per cent. A specimen for biopsy was taken from the right pampiniform plexus, and the right inguinal gland was also removed.

Microscopic examination of the lymph node revealed an intense hyperplasia of the lymphoid follicles. The germinal centers were enlarged two to three times their normal size. They contained early and mature lymphocytes and plasma cells. The peripheral sinuses were crowded with mature lymphocytes, plasma cells and numerous eosinophilic leukocytes. Ramifying throughout the periglandular connective tissue, trabeculae, lymph sinuses and lymph cords were numerous mature eosinophils. The lymphatics, predominantly the afferent channels, contained a thin pink-staining albuminoid fluid material. There was no evidence of worm foci present. Microfilariae were not visible. A granulomatous reaction was not present. There was no indication at this stage of an epithelioid endo-lymphangitis or perilymphangitis.

Microscopic examination of sections of the pampiniform plexus revealed large aggregates of eosinophilic leukocytes strewn throughout the areolar connective tissue. These eosinophils were associated with small collections of lymphocytes, plasma cells and an occasional epithelioid cell and were seen infiltrating the media and adventitia of the small venules and walls of the lymphatics. In a number of areas these eosinophils had aggregated together and become pyknotic, and surrounding this necrotic central focus were tiny collections of epithelioid cells exhibiting a clear reticular cytoplasm. There was no evidence of giant cells or caseation. Worm foci were visible.

SUMMARY

A clinic-pathologic concept of early filariasis has been developed as a result of prolonged clinical observation of young soldiers residing in endemic areas, correlation with biopsy studies and the utilization of a skin test employing *Dirofilaria immitis* as an antigen in titer dilution.

It is believed that the disease, as manifested in this group, can be subdivided into three phases, namely acute, subacute and early chronic stage.

The acute and subacute phases have distinct clinical pictures and typical morphologic findings. The chronic stage is clinically silent and histologically is characterized predominantly by fibrosis.

Direct smears and Knott concentration methods have persistently failed to reveal microfilariae in the blood stream.

Evidence was obtained to support the systemic and constitutional nature of the disease during its early stages.

LARGE SCALE TESTING FOR RH NEGATIVE BLOOD

MAJOR LESLIE H. TISDALL

AND

CAPTAIN DONALD M. GARLAND

MEDICAL CORPS, ARMY OF THE UNITED STATES

WITH THE TECHNICAL ASSISTANCE OF EVAN L. DURHAM
NEW YORK

The role played by the Rh factor in the etiology of transfusion reactions has been well known since the work of Wiener and Peters¹ and of Levine and his co-workers.² These reactions may be divided into two groups. The first and most common is that occurring in Rh negative pregnant or postpartum women because of the presence in their blood of anti-Rh agglutinins due to isoimmunization by Rh positive fetal blood. The second group is that occurring in Rh negative individuals who have been the recipients of one or more transfusions of Rh positive blood, as a result of which anti-Rh agglutinins have been formed in their blood. In both groups therefore the reactions are caused by the transfusion of Rh positive blood into recipients whose blood contains anti-Rh agglutinins.

TABLE 1.—Rh Tests on Random White Population

	Male	Female	Total
Number of tests.....	12,506	9,207	22,133
Number of Rh negative bloods.....	1,853 (14.6%)	1,590 (17%)	3,143 (14.2%)

TABLE 2.—Rh Tests on Random Colored Population

	Male	Female	Total
Number of tests.....	135	153	283
Number of Rh negative bloods.....	13 (10.4%)	15 (9.5%)	28 (9.8%)

The Army Whole Blood Procurement Service is particularly interested in this problem. The function of this service is to supply whole blood to the overseas theaters of war. Every effort is made to have this blood supply as safe and effective as possible. Obviously, the proper management of the severely wounded demands multiple transfusion of whole blood. As many as thirty transfusions to 1 casualty in a relatively short time is not uncommon. Since about 14 per cent of the random white population is Rh negative, it follows that many of these recipients of multiple transfusion may have reactions. With this in mind a project was established of shipping quantities of Rh negative blood as part of the regular blood supply.

In order to obtain Rh negative blood in quantity, it was necessary to utilize an easy and swift method of Rh determination. The complete Rh typing of a blood using anti-Rh₀, anti-Rh' and anti-Rh'' serums is unnecessary for practical use. The use of the combined serums anti-Rh₀ containing the two agglutinins anti-Rh₀ and anti-Rh' will react with 87 per cent of cells from the random white population and will miss only 0.5 per cent of Rh positive cells, namely the Rh'' phenotype. Through the courtesy of Dr. Louis Diamond

From the Army Whole Blood Procurement Service, 2 East 37th Street, New York 16.

of the Boston Blood Grouping Laboratory, we were supplied with anti-Rh₀' serum. This is a potent human antiserum with an agglutinin titer of well over 1 to 1,000 and with a high avidity index. All positive cells show agglutination in two minutes at the maximum.

TECHNIC

Each bottle of blood is brought to the laboratory with a sample of undiluted blood accompanying it. The undiluted cell suspension, remaining after the serum in the sample tube has been aspirated, is used for the test. The actual testing is done on a plate glass slide 8 by 7 inches ruled off into 1 inch squares. This permits fifty tests to be run simultaneously, together with necessary controls. One drop of anti-Rh₀' serum is placed on each square, using the dropper supplied with the bottle. One drop of the undiluted cell suspension is added with a separate medicine dropper for each test. The resulting suspension is then thoroughly mixed by using the bottom of a Kahn tube, which is wiped dry after each use. Controls with known negative and positive cells are set up. The cell mixtures are allowed to remain on the flat surface for one minute, and then the slide is rotated gently from side to side to loosen any cells adherent to the plate glass. When the positive control shows complete agglutination—usually within a minute—the tests are immediately read macroscopically. Cells over 24 hours old should not be used. The anti-serum, which is kept in a refrigerator, should be at room temperature when used for testing. The actual setting up and reading of fifty such tests takes about fifteen minutes.

In order to check the accuracy of this technic a parallel test was run with the test tube method. A human anti-Rh₀ serum prepared by Capt. John Elliot, Sn. C., of the Department of Surgical Physiology, Army Medical School, Washington, D. C. was used with the following technic:

Three cc. of isotonic solution of sodium chloride is added to the blood clot remaining in the original pilot tube. The added saline solution is drawn up and expelled a few times by a medicine dropper. A separate medicine dropper is used for each tube. This results in an approximately 2 per cent cell suspension. One drop of the 2 per cent cell suspension and one drop of the anti-Rh₀ serum is placed in a Kahn tube. The tube is well shaken and placed in a water bath at 37 C. for one hour. The tubes are then centrifuged at 1,000 revolutions per minute for one and one-half minutes and immediately read for macroscopic agglutination. If none is visible, a drop is examined on a slide, microscopically. The presence of agglutination designates the blood as Rh positive; its absence denotes an Rh negative blood. Known positive and known negative controls are also run with this technic.

There was 98 per cent agreement of the results by the test tube and the slide method. The difference is explained by the fact that one serum is of the 85 per cent type while the other is of the 87 per cent. For complete accuracy, only those bloods were recorded as Rh negative which were negative to both tests. This means, in effect, that the recorded negative bloods were the results of testing with Rh₀ antiserum. The finding of 14.2 per cent Rh negative blood in 22,133 tests is in accordance with previously recorded figures.² It was interesting to note the almost perfect agreement of the percentage of Rh negative males and females.

In compiling these figures there were noted 283 Negro bloods, which were separately recorded. The percentage of Rh negative bloods was consistent with the results of other investigators.¹

In the course of these investigations several anti-Rh serums of the animal type were used. In our hands these serums were not sufficiently accurate for routine use either by the slide or by the test tube technic. Several human anti-Rh serums were also tested and it was found that only those of a high agglutinin titer, at least 1:1,000, and a high avidity index were acceptable for the slide test. Weaker human anti-Rh serums are satisfactory for the tube technic. Dried human anti-Rh serums also have been found to be quite accurate.

COMMENT

The present day knowledge of the importance of the Rh factor to the clinician, particularly the obstetrician, the pediatrician and the transfusionist, makes imperative the determination of its presence or absence in a large number of persons. Certainly no premarital, antepartum or pretransfusion examination is complete without an Rh testing. Using a high titered human antiserum with a high avidity index, the slide technic has been most satisfactory for large scale Rh testing. The ease with which Rh testing can be performed on a large scale should place it in the category of a routine test.

PHTHALYLSULFATHIAZOLE

("SULFATHALIDINE")

CLINICAL, CHEMICAL AND BACTERIOLOGIC EVALUATIONS IN INFECTIOUS DISEASES OF THE COLON

MICHAEL H. STREICHER, M.D.

Assistant Professor of Medicine, University of Illinois College of Medicine
CHICAGO

While good results have been obtained with sulfonamides previously utilized in the intestinal canal, one is constantly on the alert for an agent that may approximate perfection. In recent years sulfaguanidine and succinylsulfathiazole (sulfasuxidine)¹ have been the two agents most widely used in the management of infectious diseases of the colon. Favorable results were obtained in a large percentage of patients treated with the two sulfonamides just mentioned.

In the evaluation of sulfaguanidine it is my experience that this agent is more toxic than succinylsulfathiazole, that larger dosages are required for optimum results and that the blood concentration determinations reach a higher level. Succinylsulfathiazole, on the other hand, is apparently less toxic and, while large doses have been prescribed orally, the blood levels range between 1 and 1.5 mg. per hundred cubic centimeters of blood irrespective of the duration of administration of the drug, thus indicating that the absorption of the drug from the gastrointestinal tract is negligible.

Recently a new sulfonamide has been developed named phthalylsulfathiazole, or sulfathalidine. This compound is similar to succinylsulfathiazole chemically

and therapeutically but is more effective. Ross and Poth² have reported that phthalylsulfathiazole is absorbed sparingly from the gastrointestinal tract, that it maintains low concentrations in the blood (0.1 mg. to 1.5 mg.) and that it is rapidly excreted in the urine; they claim that the new drug has two to four times

TABLE 1—Efficacy of Phthalylsulfathiazole in Infectious Diseases of the Colon

the bacteriostatic activity of succinylsulfathiazole and that it causes no toxic symptoms in man. Because phthalylsulfathiazole exerted a more bacteriostatic effect on the intestinal flora and because smaller doses were required to produce this effect, the new sulfonamide was placed on clinical trial.

This presentation is intended to give the general practitioner an analysis of the new sulfonamide in its application to infectious diseases of the colon. The study entails a careful evaluation of phthalylsulfathiazole in the treatment of 100 patients with infectious and necrotic lesions of the colon. Chemical concentrations of the drug were determined in the stool and correlated with blood levels and bacteriologic studies.

RESULTS

Clinical Studies.—Of the 100 patients treated, 72 were female and 28 were male; of these 80 had chronic ulcerative colitis, 6 had amebic dysentery, 2 with bacillary dysentery, 8 with *Giardia lamblia*, 2 with paratyphoid and 2 with *Dientameba fragilis*. In table 1, the efficacy of phthalylsulfathiazole is shown. It is important to note that in chronic ulcerative colitis the patients in the acute stage of the disease show improvement comparable to the ones in the chronic group. In amebic colitis our results demonstrate again that sulfonamides have not been efficacious.

The results demonstrated in *Giardia lamblia* and in *Dientameba fragilis*, while favorable, are new in our experience and should be rechecked on a larger group of patients.

Clinically definite improvement is noted in the overall picture in infectious disease of the colon under phthalylsulfathiazole therapy. Of the 100 patients under study, 84 demonstrated good results, 6 show fair results and 10 patients show poor reaction to treatment. In chronic ulcerative colitis cramping in the abdomen subsides within seventy-two hours, the evacuations are reduced in number, the stools show a tendency to become formed and odorless, and the blood in the stool disappears in a few days after intake of the new drug. The patient feels better, eats better and gains weight. The acute fulminating types respond well in that the temperature is reduced considerably in seventy-two hours, the evacuations become less frequent and the tenesmus subsides. Phthalylsulfathiazole has been administered to many of our patients over two, four, six and eight week periods

intermittently without demonstrating any toxic manifestations. Some patients were permitted to remain on a specific dosage for six to nine months without interruption to prove lack of toxicity. The matter of dosage will be discussed subsequently. In general, the patients on this therapy do very well and are in condition to do their work. In addition to the administration of phthalylsulfathiazole the patients under our care receive supportive measures and a controlled diet, so that the standards for study are parallel.

Therapeutic Dosage.—The dosage of phthalylsulfathiazole originally advised was 0.125 Gm. per kilogram of body weight daily (approximately one half that of succinylsulfathiazole. Thus, a patient weighing 150 pounds (68 Kg.) would receive 8.5 Gm. (seventeen tablets) of phthalylsulfathiazole daily. This dosage, in our experience, proved to be detrimental, unnecessary and wasteful, and after chemical studies were made on the blood and stools a dosage of 3 Gm. daily was decided on. On 12 Gm. daily intake the majority of our patients experienced severe cramping, more looseness in the stools and an increase in the number of evacuations.

CHEMICAL STUDIES

Blood Concentration Level.—The blood level studies show that the concentration of the drug in the blood stream ranges from 0.5 to 1.5 mg. per hundred cubic centimeters of blood irrespective of the dose intake. On a small dose it necessarily takes a few days longer before the upper blood levels are approached.

Stool Concentration Level.—Stool concentration tests were made in order to account for the recovery of the drug taken orally. Determinations were made of the amount of the total phthalylsulfathiazole in the entire stool for each day. Results show that about 55 to 65 per cent of the amount of the drug taken orally is recovered in the stool on a dosage of 3 Gm. (table 2).

Urine Concentration Level.—The amount of phthalylsulfathiazole excreted in the urine is equal approximately to 5 per cent of the amount of oral intake. The estimate of drug recovery on the daily oral intake of

TABLE 2—Recovery of Phthalylsulfathiazole in Milligrams for Seven Day Period, Patient J

	Daily Intake 3 Gm.							Per Cent of Recovery
	1	2	3	4	5	6	7	
Urine.....	150	150	150	150	150	150	150	61.9
Stool.....	135	208	2,515	2,021	3,391	1,336	3,112	
Blood.....	57	57	81	81	45	45	45	
Total....	345	365	2,746	2,252	3,586	2,048	3,507	
	Daily Intake 12 Gm.							Per Cent of Recovery
	1	2	3	4	5	6	7	
Urine.....	600	600	600	600	600	600	600	41.9
Stool.....	1,717	1,012	4,540	5,961	5,961	8,216	7,540	
Blood.....	57	57	45	57	45	45	81	
Total....	2,374	1,669	5,185	6,521	6,511	8,861	8,221	

3 Gm. would be 150 mg. and on 12 Gm. intake 600 mg. In tables 2 and 3 is shown an example of a recovery experiment demonstrating the amount of total phthalylsulfathiazole recovered in the urine, stool and the blood stream of 2 patients receiving 3 Gm. and 12 Gm. daily for seven days.

It is interesting to point out that the amount of total drug recovered seldom approaches the amount of oral intake, indicating that a substantial percentage of the drug intake is not recoverable; this may be due to lack of more accurate methods of estimating the

² Poth, J. L., and Ross, C. A. *Antibiotic and Chemotherapy*, 22: 111, 1932.

drug in the excreta or perhaps due to the presence of naturally diazotizable substances in the normal excreta, such as compounds produced by *Escherichia coli* or amino acid groups.

In table 2, patient 1, on a daily oral intake of 3 Gm. of phthalylsulfathiazole, the percentage of drug recovery

TABLE 3.—*Recovery of Phthalylsulfathiazole in Milligrams for Seven Day Period, Patient 2*

	Daily Intake 3 Gm.							Per Cent of Recovery
	1	2	3	4	5	6	7	
Urine.....	150	150	150	150	150	150	150	56.6
Stool.....	1,111	1,166	1,331	1,638	3,275	1,664	1,566	
Blood.....	58	63	45	67	81	65	63	
Total....	1,319	1,379	1,576	1,845	3,506	1,872	1,779	
	Daily Intake 12 Gm.							Per Cent of Recovery
	1	2	3	4	5	6	7	
Urine.....	600	600	600	600	600	600	600	54.5
Stool.....	7,079	3,652	7,128	2,436	3,281	5,460	7,350	
Blood.....	89	61	81	63	53	81	89	
Total....	8,668	4,315	7,809	3,099	9,042	6,141	8,079	

in the stool was 64.9, while in the recovery on the 12 Gm. daily intake the percentage was 41.9.

In table 3, patient 2, the percentage of drug recovery in the stool was 56.6 and 54.5 respectively.

Both tables demonstrate the general tendency of phthalylsulfathiazole to concentrate the drug in the stool to a greater degree on a smaller amount of oral intake. This general trend has been demonstrated many times in our studies.

BACTERIOLOGIC STUDIES

Detailed bacteriologic studies were made on 50 patients having infectious processes in the colon. The studies were directed primarily toward identification, bacterial counts, staining peculiarities and reaction to sugars of the coliform group, the streptococci, the staphylococci and total bacteria.

TABLE 4.—*Bacterial Count of Stools Before and After 3 Gm. of Phthalylsulfathiazole, Patient 1*

8	0.02	8	0.1	8	0.06	8	0.2		
Before and After 12 Gm. of Sulfathalidine									
16.4		1.2		3.9		20.0			
1	5.0	1	0.4	1	0.4	1	5.0		
2	2.6	2	0.2	2	0.4	2	4.0		
3	0.4	3	0.1	3	0.4	3	0.1		

These estimations were made before and after administration of phthalylsulfathiazole and were calculated on a unit study of 1 Gm. of stool.

In tables 4 and 5 is shown a bacteriologic study of patients 1 and 2 before and after oral intake of 3 Gm. and 12 Gm. of phthalylsulfathiazole respectively. Studies such as demonstrated in table 4 were made on all patients. (A detailed presentation of all bacteriologic studies is not intended in this publication.) These

figures are representative of all studies made. It is evident that the counts are definitely diminished in *Escherichia coli*, streptococci, staphylococci and total bacteria on 3 Gm. of phthalylsulfathiazole daily, and that, while on 12 Gm. doses daily the bacterial count is diminished more rapidly, it approximates the same level on the seventh or eighth day. Similar findings are demonstrated in table 5.

COMMENT

It is my impression that phthalylsulfathiazole is less toxic and more bacteriostatic than any intestinal agent used previously and that, because it has these properties, smaller doses of this drug may be used to advantage. In our analysis, determinations have been made to show that a daily dose of 3 Gm. taken orally will bring about the desired therapeutic effect in infectious diseases of the colon and that doses of 12 Gm. or more are not essential. Large amounts of phthalylsulfathiazole not only are wasteful but are detrimental.

Patients receiving 12 Gm. of the drug complain of considerable cramping in the abdomen, exaggeration of the liquid consistency of the stool and an increase in

the number of evacuations. In a comparative study made of phthalylsulfathiazole and succinylsulfathiazole one comes to the conclusion that the new sulfonamide is a superior therapeutic agent in colon infections.

CONCLUSIONS

1. Phthalylsulfathiazole is efficacious in colon infections.
2. The new sulfonamide produced no toxic symptoms in 120 patients.
3. A dosage of 3 Gm. daily is preferable to larger amounts.

ABSTRACT OF DISCUSSION

DR. HENRY W. CAVE, New York: My experience with phthalylsulfathiazole, or sulfathalidine, has been in the pre-operative preparation of 120 patients for procedures carried out on the colon and of 10 persons with mild forms of ulcerative colitis, in which haustral markings were still obtained, without pseudopolypoid degeneration or stiffening of the colonic wall. I agree with Dr. Streicher that it is not necessary to give doses of 12 Gm. daily. In these cases I have given 6 Gm. as a rule and have found it sufficient to stop bleeding, diminish cramping and show a decided improvement in the appearance of the mucous membrane of the rectal pouch and the lower sigmoid. I have had no toxic effects from the use of the drug preoperatively except in 2 instances. Three of the 10 patients to whom I have given this newer drug sulfathalidine have had it over a period of one year. They have shown good improvement.

gain in weight, diminution in the amount of diarrhea to one or two bowel movements a day, and are apparently well. The mucous membrane is clear. There have been 4 who have been on the drug for a little more than six months and have shown improvement. Three have been on the drug for four months and have shown improvement; 1 in this last group did have three recurrences but has now straightened away satisfactorily. The group of 10 patients is too small from which to draw any conclusions. But certainly the group of 80 reported by Dr. Streicher have shown improvements which must be taken notice of. This new drug, which is relatively nontoxic, seems to have beneficial effects on infections of the colon. I do not believe the drug is as satisfactory as succinylsulfathiazole in the preoperative preparation of patients, for the movements are not quite as soft and they did not tend to form scybalous masses as with sulfathalidine in the large intestine, which is a hindrance at times in doing a partial resection of the colon.

DR. J. ARNOLD BARGEN, Rochester, Minn: Drugs of the sulfonamide series have been very helpful in the treatment of various inflammatory and infectious intestinal disorders. Such drugs have been administered orally, as retention enemas and by subcutaneous and intravenous routes. The very nature of the intestinal tract made it apparent rather early in our study of these drugs that in order to obtain desired results they would have to be given in large amounts. In the treatment of intestinal diseases the drug should be in actual contact with the intestinal wall continuously, and there should be a minimum of systemic absorption and in turn a minimum of systemic intoxication. The drugs which have answered these requirements best and have done most in the treatment of ulcerative colitis and other infectious intestinal diseases are azosulfamide (neoprontosil), sulfaguandine, succinylsulfathiazole and sulfathalidine. Most of the other sulfonamide compounds, too numerous to mention, were found to be absorbed in too large amounts, when given in effective doses causing in turn too great toxic symptoms, to be adaptable to the treatment of intestinal diseases. Last March I published the results of treatment with sulfathalidine of 37 patients with ulcerative colitis of the streptococcal variety. Our experiences with that group of patients were very similar to those which Dr. Streicher has reported. Since then we have treated at least another 50 patients with this type of colitis, with similar results. The response of at least 70 per cent of these patients to the program of therapy in which sulfathalidine played a prominent role was very good. In the past my colleagues and I have felt that azosulfamide was the drug of choice for the treatment of the streptococcal type of ulcerative colitis. However, a number of patients have had toxic reactions to azosulfamide in the form of erythematous rash, sore throat, chills, fever and the like. It is of interest to note that some of the 37 patients had such reactions and most of them had no similar reactions to sulfathalidine. However, even though toxic reactions to this drug have been minimal in general, and the least common of any of the drugs so far employed, reactions do occur. One of the series, a woman aged 47, had similar reactions to sulfathiazole, succinylsulfathiazole, azosulfamide and sulfathalidine. Another woman, aged 55, had a severe reaction with fever and generalized erythematous rash to succinylsulfathiazole, and a similar reaction to sulfathalidine. By and large, however, when reaction to one of the other drugs occurred, no reaction occurred with the use of sulfathalidine. Furthermore, a good many patients have shown an initial satisfactory response to one of the other three drugs mentioned but the response was not sustained. Such a sustained response promptly occurred by the use of sulfathalidine. We have also used sulfathalidine in the treatment of some cases of recurrent regional ileitis and segmental colitis, with good response in a few. For some years now we have given rather large amounts of succinylsulfathiazole preoperatively for several days to patients on whom intestinal resection has been planned. Occasionally these patients have exhibited rather severe toxic symptoms to the drug. In these cases sulfathalidine has been given without such toxic symptoms or with minimal symptoms. It is important to know that when patients are sensitive to one

drug of the sulfonamide series there is another drug available for a similar purpose with less toxicity and yet good effects in selected cases. It seems from the observations so far available that sulfathalidine is such a drug for use in intestinal disorders. Its toxicity is less, it will frequently be associated with satisfactory results when satisfactory improvement does not follow the use of other drugs or when toxic effects follow their use and finally, as Dr. Streicher has pointed out, smaller amounts of the drug are usually more effective than of any of the other drugs in common use for intestinal conditions.

DR. BERRILL B. CROHN, New York: The experiences of Dr. Streicher with the use of phthalylsulfathiazole in infectious diseases of the colon, particularly with ulcerative colitis, are exceedingly promising. The percentage of reported "good" results, the lack of mortality and the absence of toxicity of the drug exceed the best results published to date. For two years I have used the drug in cases of ulcerative colitis and ileitis. My comments are based on purely clinical conclusions as observed at the bedside, as war conditions have made it difficult to carry out extensive bacteriologic studies. The dosage of phthalylsulfathiazole that I have employed is the same used by the author, namely, 3 to 4 Gm. daily by mouth. The drug was prescribed over long periods without deleterious consequences. It is almost entirely nontoxic, hemolytic anemia has not been observed (in contrast with sulfathiazole), toxic rashes are nonexistent, and no adverse effect is noted on the temperature or the appetite. One case only of mild and transient hepatitis with jaundice was observed, symptoms disappearing within a few days of the discontinuance of the specific therapy. In its clinical efficacy, phthalylsulfathiazole has few advantages over succinylsulfathiazole except a lesser toxicity, but it does not offer any greater, if as great, therapeutic result. Succinylsulfathiazole gives better clinical results, particularly in the more severe and more acute types of cases. The diminution in the fever and in the number of stools may be more gradual but occurs in a larger percentage of cases. Nowhere in my experience with either the phthalyl or the succinyl compound of sulfathiazole have I ever approached such an optimistic picture as reported by the author as 84 per cent of good, 6 per cent of fair and only 10 per cent of poor reactions to treatment in inflammatory conditions of the colon, most of which cases (80 per cent) comprised acute and chronic ulcerative colitis. This last year particularly has been marked by the extreme severity of some of the acute cases, in 2 of which, fulminating in character, death occurred in spite of the use of large doses of both varieties of the drug. The chronic ulcerative colitis cases also have been very resistant to forms of therapy. My former, somewhat guarded enthusiasm and advocacy of succinylsulfathiazole in the treatment of colitis continues, but these moderate results are not equalled and surely not surpassed by the newer, more concentrated bacteriostatic effects of sulfathalidine. The best clinical results that I have seen have been in the combined use of the intestinal sulfonamide drugs by mouth, coincident with the employment of acriflavine base 1:4,000 as daily retention enemas. In the combined forms of colitis and ileitis and in the cases of ileitis and ileojejunitis sulfathalidine seems far superior to succinylsulfathiazole, it controls fever, diarrhea and abdominal cramps, and it has a striking effect in bringing about the spontaneous closure of persistent abdominal small fistulas and perirectal abscesses and fistulous tracts.

DR. MICHAEL H. STREICHER, Chicago: The discussions presented by Drs. Cave, Borgen and Crohn are conclusive and add much to this exposition. I concur in the opinion of Dr. Cave that succinylsulfathiazole is more satisfactory than phthalylsulfathiazole in preoperative preparation of patients. It is of interest to know that Dr. Borgen has had favorable experiences with the use of smaller doses of sulfathalidine in ulcerative colitis. The results referred to by Dr. Crohn in alleviating the symptom complex in cases of ileitis, ileojejunitis and ulcerative colitis with sulfathalidine are promising. Discussions such as these are of practical importance and will encourage a more extensive evaluation of the new sulfonamide.

BERYLLIUM POISONING

H. S. VANORDSTRAND, M.D.

ROBERT HUGHES, M.D.
CLEVELANDJ. M. DENARDI, M.D.
LORAIN, OHIO

AND

MORRIS G. CARMODY, M.D.
PAINESVILLE, OHIO

Beryllium poisoning is an industrial disease that demands attention because of the loss in manpower and the fatalities incident to increased production in the beryllium industry. During the past four years 170 cases of poisoning were seen among workers in three plants producing beryllium, its compounds and its alloys. Manifestations included dermatitis, chronic skin ulcer and inflammatory changes in the respiratory tract, skin and respiratory tract changes occurring concurrently or singly. The severest manifestation was diffuse pneumonitis. This caused the death of 5 patients.

The importance of the beryllium industry during the present war and the anticipated postwar demands for civilian products emphasize the need to know the potential hazards of beryllium production. Of great importance in war production is beryllium copper alloy, which is corrosion resistant, nonrusting, nonsparking and nonmagnetic and has good electrical conductivity, high strength and excessive fatigue resistance. It is used in precision instruments, altimeters, airplane pipe lines, carburetors, telephone switchboards and a host of other articles. Because beryllium is a strategic metal, its availability is governed by strict priority regulations.

In the processing of the ore, beryllium oxide is extracted under high temperatures from the crushed inert ore beryl by concentrated acids and fusion methods. Fumes and dusts of by-products, wherein lie the production hazards, are present at the various stations during the processing.

REVIEW OF THE LITERATURE

Experiments conducted by Fairhall and his associates¹ showed that several beryllium compounds are toxic to animals. Both pneumonitis and dermatitis were produced experimentally. Toxicity was demonstrated for the acid radical of such salts as fluoride or oxyfluoride and for certain hydrolyzed beryllium salts, such as chloride or sulfate. They were unable to establish toxicity for beryllium per se but stressed the fact that local irritation reactions could be produced in animals by the hydrolysis of soluble beryllium salts, regardless of the mode of administration.

In 1933 Weber and Engelhardt² in investigating the effects of beryllium dusts on guinea pigs concluded that lung damage from inhalation was similar to that produced by inhalation of corrosive gases, such as phosgene or chlorine. Fabroni³ coined the term berylliosis for this pathologic condition.

In 1936 Gelman⁴ reported his observations on workers in beryllium plants in Moscow. He termed the

disease poisoning by vapors of beryllium oxyfluoride and described two phases of clinical symptoms. The first phase consisted of chills and fever much like those of metal fume fever. The second phase, which developed in two days or more, was characterized by extensive bronchioalveolitis. In elaborating this report in 1938 Gelman⁵ described roentgenologic changes in the lungs and skin changes. The lung condition was attributed to the action of fluorine, which Gelman thought was separated from beryllium oxyfluoride at the level of the bronchioles and alveoli.

In 1940 Berkovits and Israel⁶ attributed symptoms in a series of 46 cases to beryllium fluoride. They stated that serial roentgenograms were essential in diagnosis and that in some cases roentgenograms did not become normal after symptomatic recovery but showed changes "resembling pulmonary sclerosis."

In addition to our previous communication⁷ Kress and Crispell⁸ recently reported 4 cases of chemical pneumonitis in men working with fluorescent powders containing beryllium.

ETIOLOGY

The specific etiology of beryllium poisoning is unknown, but the pathology findings, the clinical course of the disease and data obtained by others in the investigation of the toxicology of beryllium suggest a chemical reaction as the cause.

In our patients clinical manifestations occurred only after exposure during processing of the ore and cleared completely when proper precautions were observed or when work was terminated. The disease was not limited to men in one type of work or in one phase of production; it occurred in maintenance men, in furnace tenders and in workers with distillation and electrolytic processes. Incidence and severity were proportional to the degree of exposure and chemical irritation of dusts and fumes.

That several beryllium compounds are toxic to animals and that the disease occurs in men working at various jobs indicate that several beryllium compounds may be causative. The acid radical salts, according to Fairhall and his associates,¹ appear more toxic than other compounds and are capable of producing acute reactions. It has not been proved, however, that severe damage may not be caused by beryllium compounds other than the acid radical salts.

DERMATOLOGIC MANIFESTATIONS

The dermatologic manifestations of beryllium poisoning were contact dermatitis and skin ulcer. These manifestations occurred in 42 patients. Frequently the lesions were associated with rhinitis and nasopharyngitis or with other manifestations of beryllium poisoning. In a large percentage of patients the dermatitis occurred within one week of employment. Most patients had contact with beryllium sulfate, beryllium fluoride or beryllium oxyfluoride, which are soluble and, as Fairhall and others have shown, are capable of producing local irritation. Inadequate cleanliness, excessive perspiration and failure to use protective devices were contributing factors.

The contact dermatitis was often severe. The eruption was an edematous, papulovesicular dermatitis with the most severe reaction occurring on the exposed portions of the body, namely the hands, arms, face and neck (fig. 1 *a*). At times there was a great deal of weeping. Itching was intense. Some patients had the sensation of burning.

Fig. 1—*a*, contact dermatitis; *b*, contact dermatitis and associated early conjunctivitis; *c*, beryllium ulcer.

After exposure to beryllium had terminated, the dermatitis tended to subside and clear up. Certain local measures were found to be beneficial. Local treatment consisted of moist wet packs of Burow's solution 1 part to 9 parts of water. For less acute cases calamine lotion with 0.5 per cent phenol was used. After the reaction subsided and desquamation began, the topical remedy was changed to boric acid ointment with 0.5 per cent phenol.

Conjunctivitis occurred with "splash burn" or in association with contact dermatitis involving the upper part of the face. Signs and symptoms were similar to those of acid burns or catarrhal conjunctivitis (fig. 1 *b*). No complications nor sequelae were observed, and healing was complete in all cases. Local treatment included the use of boric acid solution, mild zinc and epinephrine in solution, and a salve of holocaine (phenacaine hydrochloride) and epinephrine.

In beryllium ulcer a beryllium crystal was deposited within the skin layers. The lesion developed only after trauma, such as an abrasion or a laceration, and was seen predominantly among beryllium sulfate workers. At this site of trauma the initial lesion, a small indurated papule surrounded by an area of erythema, appeared and later underwent necrosis.

The ulcer occurred on exposed parts, particularly the forearms and hands, and was discrete and as a rule single (fig. 1 *c*). It caused little distress unless infected or located near a joint and subjected to the trauma of motion.

Treatment was early incision of the papule and curettage of the fibrous base. Healing was complete in eight to ten days. If neglected, the lesion persisted until traumatic extrusion of the inclusion center occurred. This center consisted of caseous material

within which the beryllium crystal usually could be identified. Healing would not take place until the embedded crystal was eliminated.

CASE 1.—A man aged 62 began work at the beryllium company as a furnace operator on March 5, 1942. On Dec. 22, 1943 examination showed an infected beryllium ulcer on the first joint, dorsal aspect, of the right thumb. This was excised, and pathologic examination revealed that the ulcer extended through the epidermis and into the reticular stratum of the dermis. At the edge of the ulcer, squamous epithelium extended into the dermis and also for a short distance over the base. In the neighborhood of the ulcer the epidermis showed keratosis, acanthosis and parakeratosis. In the basal layers the nuclei were larger than natural and slightly hyperchromatic, but there was less than the average number of mitotic figures in these cells. The base of the crater of the ulcer was covered by a layer composed of fibrin, fibrinoid material and necrotic tissue, all enmeshing polymorphonuclear leukocytes, lymphocytes and macrophages in various stages of degeneration. There was beginning organization of this exudate, beneath which was a layer of granulation tissue. In the region of the ulcer the dermis was edematous, well vascularized and densely and diffusely infiltrated with polymorphonuclear leukocytes, plasma cells, large mononuclear cells and some eosinophils. Deeper down, beneath the ulcer, the exudate in the dermis was composed mainly of large and small mononuclear cells and occasional plasma cells. In the subcutis the infiltration was mainly of polymorphonuclear leukocytes. No inorganic particles, amorphous or crystalline, suggestive of beryllium, were recognized in the microscopic examination of this tissue.

The diagnosis was subacute necrotizing ulceration and inflammation of the skin of the back of the hand.

Fig. 2—Pulmonary edema: Fluid in alveoli, enmeshing an occasional large or small mononuclear cell; infiltration of large mononuclear cells and lymphocytes in the interalveolar septa. No polymorphonuclear leukocytes in the exudate.

We have observed that a person with a chemical dermatitis, if allowed to continue this work, may develop chemical bronchitis and pneumonitis. The occurrence of dermatitis in new workers has been used as a rough barometer of individual susceptibility to pulmonary or bronchial irritation.

RESPIRATORY TRACT MANIFESTATIONS

Ninety patients were seen with chemical nasopharyngitis and/or chemical tracheobronchitis.

Chemical nasopharyngitis occurred principally among tenders at furnaces where hydrous beryllium sulfate was ignited to produce beryllium oxide and where

As did nasopharyngitis, chemical tracheobronchitis occurred predominantly in furnace tenders. Notable exceptions, however, were general helpers or maintenance men. It was characterized by (1) cough, (2) rales in both lungs and (3) normal serial roentgenograms. The commonest complaint was cough, non-productive except for occasional blood-streaked mucoid sputum. Symptoms of nasopharyngitis were usually concurrent, and in addition some patients had anorexia and weight loss. About one half had mild dyspnea.

Rales, characteristically present in the early phase of inspiration over the lower lung fields, were fine early in the disease and later became coarse. Vital capacity was reduced. There was an occasional low grade fever, although the temperature was never elevated more than 1 degree and chills were never associated. Vital capacity was reduced as much as 30 per cent in some cases in which there was subjective dyspnea.

Before the symptoms would subside, it was found that the patient must be removed from exposure and that work of any kind must be prohibited. Working during this illness proved dangerous, regardless of whether the job was changed or continued at the same station with the use of an air mask. Before complete rest was made mandatory, it was found either that recovery of a patient was delayed or that the patient developed a true pneumonitis.

For similar reasons the patient was not permitted to return to work until chest findings were normal, even though he was symptom free.

Fig 3.—Lobular pneumonitis: Plasma cells, lymphocytes and large mononuclear cells in alveoli and interalveolar septa. Note striking absence of polymorphonuclear leukocytes.

anhydrous beryllium fluoride and magnesium were used in the production of pure beryllium metal.

Irritation of nasal and pharyngeal mucous membranes varied in degree. The chief complaint made by these patients was soreness of the nose and throat associated with mild epistaxis, manifested by blood clots being blown from the nose. Some patients also complained of a peculiar metallic taste. As a rule, cough was not present.

There was diffuse swelling of mucous membranes with considerable hyperemia. Epistaxis was secondary to vascular engorgement in the nasal mucosa. In some untreated cases fissures occurred and persisted for two months. The patients were afebrile, and chest and laboratory findings were normal.

Treatment of chemical nasopharyngitis was primarily prophylactic. Exposure was avoided by use of an air mask or by termination of employment. Saline irrigations and liquid petrolatum nose drops afforded symptomatic relief. Most cases cleared in three to six weeks.

CASE 2—A man aged 22, employed as furnace tender for ignition of hydrous beryllium sulfate, was seen on Sept. 14, 1943 complaining of the nasopharyngeal symptoms and the objective findings described. Seventy-two hours after treatment was instituted, symptoms and objective findings cleared. Six weeks later he had a recurrence resulting from the use of a faulty air mask. Symptoms promptly subsided when a new mask was secured.

Fig 4.—Lobular pneumonitis. Large mononuclear cells with granular or foamy cytoplasm, some plasma cells and occasional lymphocytes within alveoli and in interalveolar septa.

The chest was examined roentgenologically each week for three weeks after onset of the disease. No case of pneumonitis developed after this period. The illness lasted from seven to twenty-one days. Supportive measures were used for symptomatic relief.

CASE 3.—A man aged 25 was seen on Sept. 14, 1943 complaining of intractable cough and nasal irritation of five days' duration. He frequently coughed up traces of blood, complained of a "metallic taste" and had anorexia with a 4 pound (1.8 Kg.) weight loss. There were a slight elevation in temperature (99.4 F.), moderate injection of the nasopharyngeal mucosa

Fig 5.—Lobular pneumonia: Beginning organization. Fibroblasts replacing intra-alveolar and interalveolar exudate of plasma cells, lymphocytes and large mononuclear cells.

and numerous fine inspiratory rales over the lower lungs. Vital capacity was 3,400 cc., 1,000 cc. below the computed normal. On roentgenologic examination the chest was normal.

During the two weeks in which he was away from work and on a modified rest regimen, his symptoms subsided, auscultatory findings disappeared and vital capacity returned to normal.

Chemical pneumonia developed in 38 workers on many different jobs; no one station could be isolated as the source of exposure. It represented the severest form of this industrial disease and progressed without exacerbation or remission either to complete recovery or to death.

Symptoms were (1) cough with occasional blood-streaked sputum, (2) substernal burning pain, (3) shortness of breath, (4) cyanosis in most cases, (5) abnormal taste, (6) anorexia with some weight loss and (7) increasing fatigue.

In each instance the onset was insidious and was characterized by dry cough and occasional dull substernal burning pain. The pain tended to disappear after one or two weeks, but the cough progressed in severity with expectoration of a small amount of blood in almost every case. Within a few days or a week after onset of cough, these patients complained of dyspnea on exertion. This dyspnea was progressive, became severe even at complete rest, was frequently associated with cyanosis, and in varying severity lasted from two to five weeks. During this time the respira-

tory rate ranged from 26 to 40 per minute. Anorexia as well as weight loss of 5 to 14 pounds (2.3 to 6.4 Kg.) occurred in every case. In contrast with the severity of symptoms the temperature was often normal and was rarely elevated more than 1 to 2 degrees in patients who recovered. The last symptoms to disappear with recovery were cough and effort dyspnea. Duration of the disease from inception to complete recovery varied from five weeks to four months.

Dominant physical findings were rapid pulse, rales over both lungs and reduced vital capacity. Within a few days to a week after onset of the disease, a few fine rales could be heard during inspiration over both the anterior and the posterior aspect of each lung base. As the disease progressed, the rales increased in number, became medium to moderately coarse and were heard throughout both lung fields. Vital capacity was reduced to as low as 2,000 cc.

Signs of infection were conspicuously absent: Temperature was not greatly elevated except in the terminal stages of the fatal cases, the erythrocyte sedimentation rate was essentially normal, and blood counts and blood chemistry were also normal. In 2 patients bronchoscopy showed a hyperemic mucosa with some edema, and in 1 of these a diffuse patchy exudate was present in the lower tracheobronchial tree. Aspirated secretions from these 2 patients and expectorated secretions from others were negative on bacteriologic study for pathogens. Blood oxygen tension was not determined in any case.

Fig 6.—Pneumonia: A focus showing beginning organization. Squamous metaplasia of lining epithelium of alveolus and terminal bronchiole.

Roentgenologic changes in the lung fields did not usually appear until two to three weeks after the onset of symptoms and physical signs. Changes were bilateral and diffuse in all cases and varied with the severity of the disease. In order of appearance the changes were (1) diffuse haziness of both lungs, (2) development of

soft irregular areas of infiltration with prominence of peribronchial markings, (3) absorption of soft infiltration and appearance of discrete large or small conglomerate nodules scattered throughout both lung fields and (4) clearing of the lung fields after one to four months. It is important to emphasize that clearing of

Fig 7 (case 4).—*a*, normal appearance on routine chest examination made in 1941 before patient worked in beryllium industry. *b*, diffuse infiltration of both lungs twenty six days after onset of illness

the lungs on roentgenologic examination occurred as a rule before complete subsidence of symptoms or disappearance of all physical signs.

Beryllium Content of Lungs

Case	Duration of Exposure	Mg. of Beryllium per 10 Gm. of Tissue		Type of Work
		Wet	Dry	
6	10 mo.	0.33	1.89	Beryllium copper production and general repair
7	40 days	0.03	0.10	Beryllium copper production
9	Indefinite	0.04	0.20	Chemist and metallurgist

Necropsies on 5 patients showed atypical pneumonitis. The pathologic findings were similar in all cases. Significant changes were found only in the lungs, which were grossly heavy (1,100 to 1,380 Gm. each). Striking features in lung tissue sections in all cases were large numbers of plasma cells, relative

Fig 8 (case 4).—*a*, complete clearing of lungs demonstrated approximately one hundred and twenty one days after onset of pneumonitis. *b*, recurrent pneumonitis; appearance four weeks after onset of second attack

absence of polymorphonuclear infiltration, diffuse pulmonary edema and hemorrhagic extravasation. Fibroblasts with evidence of organization were present, although in patients who recovered no fibrosis was evident on roentgenologic examination of the chest.

Representative microscopic sections of lung tissue, illustrating pathologic findings in chemical pneumonitis, were selected and reported by Dr. Harry Goldblatt of Western Reserve University (figs. 2, 3, 4, 5 and 6).

Chemical analysis of the lungs for beryllium content was made in 3 cases by Dr. Lawrence T. Fairhall and disclosed the amounts given in the accompanying table.

Oxygen and rest were the most beneficial therapeutic measures. Oxygen was administered intermittently by mask or continuously by tent, depending on the severity of dyspnea and cyanosis. Bedrest was found to be most important during the acute phase to prevent acute pulmonary edema, as was restriction of the patient's activity until all signs and symptoms disappeared. Relapse or recurrence was secondary to precipitous activity, such as working about the house. Under such conditions reexposure was not necessary to cause a relapse. Other therapeutic agents, such as aminophylline, hypertonic glucose, and calcium gluconate, were of doubtful value.

Two cases of recovery from chemical pneumonitis and 5 fatal cases are presented to illustrate (1) occurrence of the disease in workers at different jobs, (2) recurrence of the disease after reexposure (case 4), (3) variability of the roentgenologic appearance of the lungs, (4) the importance of rest and (5) pathologic findings.

CASES OF RECOVERY

CASE 4.—A man aged 55, a general helper and worker at various stations in the beryllium plant, was seen on May 3, 1942 complaining of anorexia, shortness of breath and cough of twenty-six days' duration. He initially experienced substernal burning pain, and his cough was nonproductive except for slight hemoptysis.

There were mild cyanosis, shallow respiration, fine to medium rales on inspiration scattered throughout the lungs but most pronounced in the lower two thirds, and a reduced vital capacity (2,400 cc., computed normal 4,500 cc.). The patient had lost 8 pounds (3.6 Kg.).

Stereoroentgenograms of the chest showed extensive infiltration throughout both lungs with nodular configuration below the right clavicle (fig. 7). The heart was normal in size, shape and position, and the aorta appeared normal.

Bronchoscopy disclosed only generalized hyperemia of the tracheobronchial mucosa. A minimum of rather frothy secretion was aspirated and was negative on smear and culture for all pathogens. Expectored sputums were likewise negative. Blood counts and other laboratory tests were normal. A diagnosis of chemical pneumonitis was made.

With bedrest, symptoms disappeared in two months, and final roentgenologic examination of the chest showed no residual pathologic condition (fig. 8*a*). Vital capacity returned to normal, 4,500 cc. The patient was discharged and advised to secure different employment.

The patient was again seen on Nov. 12, 1942 complaining of the same symptoms of three weeks' duration. He had returned to work as a general helper but had avoided working around beryllium oxide. Examination revealed a recurrence of chemical pneumonitis (fig. 8*b*). This second illness was nearly fatal, lasted five months and was complicated by bacterial (pneumococcal) pneumonia and phlebitis. He required pro-

Fig 9 (case 4).—Essentially normal chest survey film made five months after onset of second attack.

longed oxygen therapy. Recovery from the second attack was complete (fig. 9).

CASE 5.—A woman aged 39 was admitted to the hospital ten weeks after beginning work with the complaints of chest pain, shortness of breath, loss of appetite, loss of 14 pounds (6.4 Kg.) and fatigue. For eight weeks she had worked in the department where beryl ore was melted and had helped repair a beryllium fluoride furnace immediately adjacent to her regular station. Seven weeks after she began to work an insidious cough developed and was progressive.

Temperature was normal, respirations were rapid (35 per minute) and shallow, mild cyanosis was present, and fine rales were heard throughout both lungs on inspiration.

A diagnosis of pneumonitis was confirmed by roentgenologic examination. Roentgenograms demonstrated an atypical nodular infiltration, which resembled pneumoconiosis (fig. 10 a). The patient remained in the hospital seven weeks. Her temperature remained normal. Treatment consisted in supportive therapy and oxygen to control dyspnea and cyanosis. Recovery was complete, and follow-up study showed entire clearing of the lungs (fig. 10 b).

FATAL CASES

Of the 38 patients with chemical pneumonitis 5 died. In all cases the clinical symptoms and physical findings were similar. Evidence of upper respiratory tract involvement was present, physical findings were those described, and laboratory reports were essentially normal.

Fig. 10 (case 5).—a, diffuse atypical nodular infiltration, resembling pneumoconiosis, approximately twenty-four days after onset of illness; b, complete clearing of lungs, approximately twenty-two weeks after onset of pneumonitis.

CASE 6.—A man aged 48, who worked in the beryllium copper department on production and general repair for ten months, was admitted to the hospital on Jan. 20, 1943 after stopping work because of cough, shortness of breath and substernal pain. Symptoms were of three weeks' duration, had begun insidiously and were progressive. The temperature was normal. There were rales throughout the chest, rapid and shallow respirations, severe dyspnea and moderate cyanosis. Roentgenologic examination confirmed the diagnosis of pneumonitis (fig. 11). Despite continuous oxygen therapy by tent and supportive treatment the patient died on the sixty-second day of his illness.

CASE 7.—A boy aged 18, who worked on production in the beryllium copper department for forty days, was admitted to the hospital on May 19, 1943 four days after stopping work because of cough, shortness of breath and substernal burning pain. Symptoms were of one week's duration and were progressive. After admission severe dyspnea and cyanosis developed, and respirations became rapid and shallow. Oxygen and supportive therapy were not effective, and the patient died on the forty-fourth day of his illness. Physical findings and roentgenograms of the chest confirmed the diagnosis of pneumonitis (fig. 12).

CASE 8.—A woman aged 35 worked in the grinding department for forty-nine days. She attributed her illness to "sulfuric acid fumes." She was admitted to the hospital on June 22, 1943, thirteen days after stopping work because of cough, severe dyspnea and cyanosis. Symptoms were of fifteen days' duration. Physical findings and roentgenograms of the chest were typical of pneumonitis. Despite intensive oxygen therapy and supportive measures the patient died on the twenty-first day of her illness. Only one roentgenogram of the chest was made because of the severe symptoms. This film, which is not available for reproduction, showed a diffuse early pneumonitis.

Fig. 11 (case 6).—Diffuse pneumonitis five and one-half weeks after onset of symptoms. Disease progressive and followed by death on sixty-second day of illness.

CASE 9.—A man aged 42, a founder of one of the beryllium plants and a chemist and metallurgist, entered the hospital on April 18, 1943. One week previously he complained of sore throat, intermittent low grade fever (99.6 F.) and blood-streaked sputum. On admission his temperature was 101 F. Respirations were 26 per minute. The nasopharynx was reddened, and a few crepitant rales were heard during inspiration over both lung bases. Roentgenologic examination of the chest showed some haziness over both lower lung fields. Blood count and sputum examinations were normal. A tentative diagnosis of atypical pneumonia was made.

Chemotherapy, which had been prescribed at home, was continued in the hospital for several days. Cough, shortness of breath and mild cyanosis developed. Chemotherapy was discontinued, and the temperature returned to normal. On the basis of the roentgenologic and clinical findings a revised diagnosis of chemical pneumonitis was made. The patient's progress was satisfactory, and after twelve days he insisted on leaving the hospital. Roentgenograms showed some clearing of the lungs, and respiratory symptoms had subsided considerably.

The patient did not remain in bed and two days later suffered an acute attack of pulmonary edema. He was readmitted to the hospital with severe cyanosis, fever (103 F.) and severe dyspnea. He died two days later, sixteen days after onset of the illness.

Fig. 12 (case 7).—Diffuse pneumonitis three weeks after onset of illness. Death occurred on forty-fourth day of illness.

This report stresses the importance of complete rest during the course of chemical pneumonitis. Despite initial improvement, early exertion precipitated a fatal

attack of acute pulmonary edema. Roentgenograms of the chest showed initial improvement; later roentgenograms were not obtained.

CASE 10.—A man aged 42, a general process worker, was the first patient observed by us with chemical pneumonitis in the beryllium industry. He was admitted to the hospital on Dec. 30, 1940 with cough, shortness of breath, blood-tinged sputum and cyanosis. Symptoms began insidiously three weeks previously and were progressive. The temperature was 99.2 F., respirations were rapid (44 per minute) and shallow, coarse rales were heard throughout the lungs and moderate cyanosis was present. Roentgenograms showed a severe diffuse pneumonitis (fig. 13). His temperature remained below 100 F. until two days before death, when it rose to 104.5 F. He died on the twenty-seventh day of his illness.

The original necropsy report was of acute organizing atypical bronchopneumonia, bilateral, and slight dilatation of the right atrium and right ventricle. Microscopic lung sections were reviewed by Dr. Harry Goldblatt, in whose opinion the findings were consistent with those of chemical pneumonitis.

PROPHYLAXIS

Elimination of fumes and dusts at all stations is necessary to control the disease. Of equal importance is prevention of accumulated dusts on floors and rafters.

Fig. 13 (case 10)—Severe diffuse pneumonitis. Death occurred on twenty seventh day of illness.

In all three plants the incidence dropped considerably after proper exhaust fans were used to remove fumes, after protective shields were placed around furnaces and after general housecleaning measures were strictly observed. Protective clothing, air masks and even gas masks were also instituted for those directly concerned with the processing.

These measures were installed in these three plants

with the help of Major Leggo of the Ohio State Department of Public Health and with the cooperation of the management. The results indicate that preventive measures can control the disease.

Dermatitis and skin ulcer have been prevented by preemployment instruction as to hazards, use of protective devices and clothing, and personal hygiene. All workers are encouraged to report promptly any minor injury, symptom or lesion.

COMMENT

The problem of beryllium poisoning may become more significant with the development of this industry. It is important that potential production hazards be recognized and precautions taken for the control of dusts and fumes.

The specific etiology of beryllium poisoning is not known. Apparently manifestations can be caused by several beryllium compounds, severity of symptoms being dependent on amount of exposure, toxicity and concentration of the substance, and possible individual

sensitivity. In this study patients employed in the sulfating and the oxyfluoride process showed the highest incidence of the disease. The chemical nature of this poisoning is indicated by its occurrence at work, absence of appreciable fever, normal sedimentation rate, normal blood studies and failure to demonstrate any pathogens on examination of bronchial secretions. Recurrence of pneumonitis on reexposure occurred in 1 patient, and until more is known about the control of this disease all such patients should be advised to change their work.

Preventive measures have been very successful in controlling the incidence of the disease. Prophylaxis has been the largest factor in diminishing the morbidity and eliminating the mortality in the last two years. Safety clothing, masks, adequate ventilation and properly protected equipment have proved of value in the prevention of beryllium poisoning.

The evidence on which a diagnosis of chemical pneumonitis is made includes (1) a history of exposure to fumes and dusts arising in the production of beryllium, (2) decrease in vital capacity, (3) dyspnea and in advanced cases cyanosis, especially in chemical pneumonitis, and (4) roentgenologic findings of edema or soft irregular areas of infiltration.

The most important single factor in the treatment of beryllium poisoning is avoidance of further exposure to beryllium fumes and dusts. Sulfonamide drugs were of no benefit in the few early cases of pneumonitis in which they were tried. Calcium gluconate and aminophylline were used in many cases of pneumonitis with questionable benefit. In the presence of dyspnea and cyanosis rest was found essential and oxygen of considerable value. Complete bedrest was regarded as being mandatory in all cases of pneumonitis. No work was permitted until all signs and symptoms of the disease had disappeared. No sequelae or disability could be demonstrated in any of the patients who recovered. All patients who recovered became symptom free, vital capacities returned to normal, and roentgenograms demonstrated clearing of the lungs.

SUMMARY

A disease entity has been encountered in workers in the beryllium industry. In three plants in the Cleveland area 170 workers have been affected by dermatologic and/or respiratory tract manifestations of the disease. When the respiratory tract is involved, the disease may progress to a symptom complex resembling chemical pneumonitis, which caused the death of 5 workers.

Psittacosis.—Apart from parrots and cockatoos, the only other group of wild birds known to be infected in nature are the fulmar petrels (*Fulmarus glacialis*) of the Faroe Islands in the North Atlantic. The young of these birds are an important source of food for the Islanders, and during the months of August and September a considerable proportion of the population is engaged in capture and preservation of the fledgling birds. In September 1933 an epidemic of pneumonia involving 71 persons, with 8 deaths, first called attention to the possibility of psittacosis being involved. In each subsequent year to 1937, numbers of cases ranging from 13 to 35 were recognized, and in 1938 the condition was definitely shown to be psittacosis by the isolation of virus both from human autopsy material and from young fulmars and by positive complement fixation tests with patients' serum—Burnet, Frank MacFarlane: *Virus as Organism*, Cambridge, Mass., Harvard University Press, 1945.

Special Article

UNTOWARD REACTIONS ATTRIBUTABLE TO ATABRINE

Army experience in all malarious theaters has shown atabrine to be extremely valuable for the suppressive treatment of malaria. Untoward reactions possibly attributable to the drug have been few, considering the large numbers of men who have been taking it and the long periods during which it has been administered. In no instance have reactions been of sufficient consequence to warrant discontinuance of the drug in a military organization or in a geographic area. As a rule, minor unpleasant reactions, such as intestinal disturbances, which not infrequently occur within the first few suppressive doses of atabrine, disappear in a few days when the drug is continued.

In the latter part of 1943, medical officers in the Southwest Pacific Area called attention to a characteristic cutaneous syndrome which was occurring in soldiers who had been evacuated from New Guinea and adjacent islands. Lieut. Col. Charles Schmitt and Major Thomas Nisbet, dermatologists stationed with general hospitals in that area, were the first to submit to the Surgeon General official reports in which they described the disease and its probable causation. Lieut. Col. John Ambler, consultant in dermatology in the Southwest Pacific Area, compiled valuable data on all of the pertinent aspects of the disease and summarized the experience of all the medical officers in the theater who had submitted verbal and written reports. Major A. M. Harvey and his associates conducted important investigative work which contributed valuable information on the primary etiologic factor. Essentially, later reports made by medical officers in this country as well as in other theaters have confirmed the observations which were included in these early reports from the Southwest Pacific Area, where the disease was first recognized. Later on, similar cases were reported from all the other theaters where suppressive atabrine medication was in general use as a control measure for malaria. This syndrome has been observed most frequently in New Guinea and adjacent islands and in Assam and North Burma; in other areas only small numbers of cases have occurred.

In brief, this skin disease, which has acquired the name "atypical lichen planus," is characterized by various combinations of the following types of lesions: violaceous and erythematous hypertrophic lichenoid papules and plaques, frequently with a rough verrucous surface; violaceous and erythematous, oozing or scaling eczematoid plaques well demarcated in some cases and ill defined in others; flat squamous geographic plaques on the trunk, axillas and groins similar to tinea lesions; white, sometimes violaceous tinged, slightly elevated

mucous membrane lesions identical with those seen in typical lichen planus; oozing intertriginous dermatitis in the groins, axillas and posterior surface of the ears; ecthymatous lesions; scaling and superficial fissuring of the lips, and scaling erythematous eczematoid dermatitis of the eyelids. In some cases the lesions are predominantly lichenoid, in others most of the plaques are eczematoid. Almost all patients have both violaceous hypertrophic lichenoid plaques and some form of cutaneous eczematoid reaction. During the course of their disease a considerable number of these patients have acute, "explosive" generalized exacerbations manifested by oozing eczematoid dermatitis having a predilection for the flexors, groins, axillas, extremities and neck. Such exacerbations resemble exfoliative dermatitis, and a few of these patients may develop a secondary exfoliative dermatitis which is as severe as the cases of primary exfoliative dermatitis. The seriousness of such a state and the need for expert management of these patients cannot be overemphasized.

Usually the disease is characterized by onset of localized violaceous or erythematous eczematoid plaques on the dorsal surface of the hands or feet, lateral surface of the neck or elsewhere, followed by generalization of the lesions with subsequent appearance of the lichenoid plaques and mucous membrane lesions. The distribution of the lesions is variable. Any part of the cutaneous surface may be involved, but there is a predilection for the legs, forearms, dorsal surface of the hands and feet, face, buttocks, V of the neck, genitalia, mucous membranes of the mouth, eyes and eyelids. Residual effects and lesions which develop in many cases later in the course of the disease include atrophy, hyperpigmentation (melanin) and depigmentation, diffuse follicular accentuation over the upper part of the back, shoulders and extremities, changes in the nails, moth-eaten patchy alopecia and disturbance in the sweating function.

For practical purposes it is necessary to describe, along with the syndrome just described, a characteristic type of eczematoid dermatitis which also has occurred in persons taking suppressive atabrine. This skin disease is characterized by bilateral symmetrical violaceous tinged, vesicular, eczematoid and oozing plaques involving the hands, arms, feet, legs and sometimes other parts of the body. Secondary pyogenic infection is common. The nail bed and skin of the nail folds are usually involved, frequently resulting in exfoliation of the nails without true suppurative paronychia. With experience, on clinical grounds one can in most cases distinguish between this eruption and other forms of eczematoid dermatitis. Tentatively the term "symmetrical eczematoid dermatitis" has been used to differentiate this disease from other forms of eczematoid dermatitis.

It does seem advisable to make a sharp distinction between the so-called "atypical lichen planus" and the "symmetrical eczematoid dermatitis" syndromes. From a broad point of view it would seem that all these patients have either a lichenoid cutaneous reaction or an eczematoid cutaneous reaction or the combination of the two types. A small percentage of the total group have lichenoid lesions alone, a larger group have a combination of lichenoid and eczematoid lesions and a still larger group have eczematoid lesions which are not accompanied by lichenoid lesions.

This article is printed simultaneously in the Bulletin of the U. S. Army Medical Department. It concerns cutaneous reactions attributable to the use of suppressive atabrine, especially the so-called "atypical lichen planus" syndrome. Contributions are appearing in medical periodical literature on this subject. The report represents the views of a considerable number of army medical experts who have seen the condition in many different areas. It was prepared by Major Clarence S. Livingsood (consultant in dermatology) and Col. Francis R. Dierckx, (Chief, Tropical Disease Treatment Branch) Medical Consultants Division, Office of the Surgeon General.

The regular occurrence of specific types of cutaneous reactions such as the lesions aforementioned renders it necessary to consider one or more drugs as the essential etiologic factor. It is a well known fact that some types of skin changes are more frequently attributable to drugs than are others and that certain drugs have a special capacity to produce characteristic reactions. Thus, cutaneous sensitivity to sulfathiazole usually results in skin lesions characteristic of toxic erythema, erythema multiforme and erythema nodosum; bromides tend to produce acneiform eruptions and ecchyma-like or ulcerative dermatoses; arsenicals produce localized and generalized eczematoid eruptions and exfoliative dermatitis as well as many other types of lesions; quinine has a tendency to produce eczematoid eruptions and exfoliative dermatitis. This list could be extended almost ad infinitum because causal drugs and the dermatologic manifestations which they produce are encountered in almost limitless numbers and varieties.

The following general principles in regard to drug eruptions are included here because they are pertinent to the lichenoid and eczematoid cutaneous reactions under discussion: (a) in the majority of drug eruptions the untoward effects are due to a peculiar susceptibility or allergy on the part of the skin of the particular individual; (b) the cutaneous changes elicited by drugs may range from mild pruritus to severe and sometimes fatal eruptions; (c) if a drug eruption is suspected, all drugs not essential to the patient's health or life should be discontinued; (d) improvement following removal of the causal drug may not occur for several weeks; (e) many patients may have periods of refractoriness, during which exposure to the causal drug does not reproduce the symptoms; (f) it is important to examine all patients with drug eruptions for damage to the hemopoietic system, liver and kidneys; (g) patients who have had cutaneous reactions to drugs, especially eczematoid lesions, are likely to have similar reactions to other related drugs or even other allergens, both endogenous and exogenous; (h) skin tests usually are of little or no value in the attempt to discover the causal drug, although the use of patch tests in purely eczematoid eruptions may be an exception.

In regard to the lichenoid and eczematoid reactions under discussion, reports of general army experience available at the present time indicate that atabrine is the essential etiologic factor (reported first by Lient. Col. Charles Schmitt and Major Thomas Nisbet). The mechanisms resulting in the lichenoid reaction and the eczematoid reaction are probably different. For example, it has been observed in one carefully controlled series of cases at Moore General Hospital (Major James Bazemore, Capt. Herbert Johnson, Capt. Ehner Swanson and Col. Joseph Hayman) that the time interval preceding exacerbations of eczematoid lesions is much shorter than is the case with the lichenoid lesions. The fact that the incidence has been so very much higher in New Guinea and adjacent islands and in Assam and North Burma suggests that climatic or geographic factors may play a contributory role in the causation. There is evidence which indicates that various forms of cutaneous trauma may contribute to the onset and localization of the lesions, particularly the eczematoid phase of the eruption. The sequence of events in many cases suggests that persons taking suppressive atabrine have a tendency to acquire chronic eczematoid dermatitis on contact with external allergens (such as certain

jungle plants) rather than self-limited contact dermatitis, which is the usual course of events. It appears that cutaneous reactions are more frequent in persons who have been taking atabrine in doses above the recommended suppressive amount (0.7 Gm. per week). It should be emphasized that the incidence of these cutaneous diseases has been relatively low, even in New Guinea. From the military point of view it has not constituted an important handicap.

In view of the fact that available evidence indicates that we are dealing with one complex, it is suggested that it would be best to group these cutaneous reactions attributed to atabrine under the one heading "atabrine dermatitis complex" and classify the various manifestations as follows:

a. Lichenoid dermatitis. b. Lichenoid and eczematoid dermatitis (a and b include cases heretofore referred to as "atypical lichen planus").

c. Eczematoid dermatitis (includes cases heretofore referred to as "symmetrical eczematoid dermatitis").

d. Exfoliative dermatitis secondary to a, b or c.

The treatment of these conditions depends for the most part on early recognition of the trouble and discontinuation of atabrine. In many instances it is difficult to decide whether or not a given case of eczematoid dermatitis is due to atabrine. It is necessary to study such cases carefully, with careful observation after withdrawal of atabrine and possibly cautious trial readministration of the drug (do not attempt readministration of atabrine to a patient who has had exfoliative dermatitis or a severe generalized eczematoid exacerbation). It is necessary to keep in mind the general principles in regard to drug eruptions which were previously outlined. When possible, such patients should be seen by a competent dermatologist and every effort should be made to rule out other etiologic factors. Parenteral administration of penicillin is indicated in patients with secondary pyogenic infection. Local treatment should be bland and nonirritating and should consist of preparations such as 1:9,000 potassium permanganate soaks, Burow's solution soaks, 5 per cent aqueous solution of tannic acid spray for oozing intertriginous sites and application of borated cold cream if a grease is indicated. Preparations such as salicylic acid ointment, tincture of iodine and sulfonamide ointments should not be used. Arsenicals and bismuth have been tried in some cases without affecting the course significantly; they should not be used. Superficial x-ray therapy, if indicated, should be used only under the direction of a competent dermatologist and in small doses (not more than 75 roentgens and not to exceed a total of more than 375 to 450 roentgens). At least some of these patients have some degree of light sensitivity. Therefore, exposure to sunlight should be avoided and ultraviolet light therapy should not be used. All patients should be studied from the general medical point of view, including studies of blood, serum proteins and liver function. Therapeutic agents such as plasma, liver extract, multiple vitamins and intravenous glucose should be used when indicated.

The prognosis varies from one person to another. In general it seems excellent, especially if the patient is hospitalized early in the course of the disease and the therapeutic measures outlined are initiated promptly. The lichenoid lesions disappear slowly, but they do not tend to recur; the eczematoid phase of the erup-

tion may disappear rapidly, but it tends to recur and is responsible for the prolonged disability which occurs in some cases. In general, recovery is a matter of weeks and months.

Residual hyperpigmentation, depigmentation and atrophy at the sites of lesions become less pronounced as time goes on and the hypohidrosis which occurs in many patients also improves spontaneously. The course is usually prolonged in all cases of exfoliative dermatitis because of frequent exacerbations. It should be noted that these patients have not been followed for a sufficient length of time to justify final statements in regard to the prognosis of these cutaneous reactions.

Another major type of cutaneous reaction which has been attributed to atabrine is primary exfoliative dermatitis not secondary to the lichenoid-eczematoid syndrome. This is characterized by acute fulminating exfoliative dermatitis, demonstrably associated with true hypersensitivity to atabrine. It is in every respect similar to exfoliative dermatitis due to other agents such as arsenicals. This type of cutaneous reaction to atabrine is believed to be associated with atabrine much less commonly than with quinine. Hypersensitivity of this degree constitutes a dangerous state in either instance.

In rare instances aplastic anemia, other severe blood dyscrasias (such as agranulocytosis) and severe acute hepatitis have occurred in association with the lichenoid-eczematoid syndrome and with exfoliative dermatitis. Similar cases have also been observed rarely in persons taking atabrine who do not develop skin disease. Attention is called to the fact that the fatality rate in these cases of aplastic anemia and of hepatitis has been almost 100 per cent. The relationship between this condition and the skin disease is not clear, but the association is striking. (As regards hepatic disease, in areas where infectious hepatitis is common the exclusion of this infection may be extremely difficult.)

Bluish pigmentation deposits of characteristic distribution involving the hard palate, nail beds, epiglottis and tracheal rings, and rarely other parts of the body, also have been reported in patients who had been taking suppressive atabrine for long periods of time. It is not thought that this bears any relation to the lichenoid-eczematoid reaction, although the two conditions sometimes occur in the same patients. Also, in rare instances, cases of urticaria have been attributed to atabrine.

Information about the cutaneous reactions described has been collected from all quarters and analyzed. Further data are constantly being gathered. Carefully planned studies designed to clarify the significance of these dermatoses and the role of atabrine and other suggested factors in its causation are being performed both in the United States and overseas. Medical officers who have been stationed in the theaters where these reactions have occurred as well as those who have seen these patients in general hospitals in the Zone of the Interior have submitted articles for publication which have now been released.

The fact that psychologic disturbances occasionally appear in association with the use of atabrine is well known. When unduly large doses are given, and rarely with moderate doses, for clinical treatment, toxic delirium, such as occurs with bromides, may develop. The psychologic disturbance may take the simple form

of brief periods of confusion. Such manifestations have been reported occasionally in connection with suppressive medication, especially when unauthorized high doses have been taken.

Many untoward effects have been attributed to atabrine which undoubtedly have no connection with the drug, as in the instance of the rumor that it affects the sexual powers.

In accordance with par. 7, AR 40-215 (25 April 1945), when after thorough study it is concluded that an individual is definitely sensitive to atabrine (or quinine), as in the case of other drugs, appropriate entry should be made on W. D. A. G. O. form 8-117 (Immunization Register).

Quinine is available for the treatment of persons who are known to be sensitive to atabrine or to be seriously intolerant of the drug. It should not be used, however, for units or organizations as a whole.

SUMMARY

In the light of these considerations and on the basis of other data which cannot be presented in a communication of this type, the following general statements regarding atabrine and reactions attributable to atabrine are submitted for the information and guidance of all concerned:

1. The military value of atabrine in suppressing vivax malaria and curing falciparum malaria far outweighs untoward effects which have been attributed with reason to the use of the drug.
2. Suppressive doses of atabrine greater than 0.7 Gm. per week should not be employed routinely. This amount has been shown to provide adequate protection against clinical attacks of malaria, provided "atabrine discipline" is strictly enforced. In clinical treatment of malarial attacks with atabrine, routine dosage should not exceed 2.8 Gm. in seven days.
3. Atabrine suppressive medication should be discontinued promptly and atabrine should not be given for clinical treatment when persons develop atypical lichen planus, unexplained chronic eczematoid dermatoses, unexplained toxic erythematous eruptions, exfoliative dermatitis, severe leukopenia, agranulocytosis and aplastic anemia, acute hepatitis (not including disturbances believed to be due to malaria) or toxic psychoses which can be reasonably attributed to atabrine after careful clinical study.
4. It should be remembered that drugs other than atabrine, such as the sulfonamides and arsenicals, may be harmful to persons with the conditions mentioned.
5. Caution should be exercised in attributing disease conditions to atabrine until careful and complete studies have been made over a period of time to establish such relationship. Because of the widespread use of atabrine, its administration inevitably coincides with many diseases with which the drug has no connection. Even if a connection is established between atabrine and a given untoward effect, its significance relative to the military value of atabrine requires evaluation. It should be remembered that, since the use of atabrine became widespread, clinical attacks of falciparum malaria have been almost eliminated and deaths from malaria have been extremely rare. There is no question of the general superiority of atabrine over quinine, both for suppression and for clinical treatment.

Clinical Notes, Suggestions and New Instruments

PENICILLIN OINTMENT IN THE TREATMENT OF IMPETIGO NEONATORUM

EDWIN L. KENDIG JR., M.D., AND RUSSELL H. FISKE, B.S.
RICHMOND, VA.

Wartime conditions, with overcrowding of nurseries and inadequate personnel, have caused impetigo neonatorum to assume new importance. This infection is always troublesome and may be followed by furunculosis, erysipelas, cellulitis or general sepsis.

In this study 14 cases were treated with penicillin ointment, with satisfactory results (tables 1 and 2).

METHOD OF TREATMENT

The penicillin ointment used in this study was always freshly made. It was prepared by taking up a stock solution of penicillin in a eucerite type base (5 per cent by weight) and dispersing in White Ointment U. S. P. XII. For the first part

TABLE 1.—Results in Patients Treated with Ointment Containing 250 Units of Penicillin per Gram

Patient	Severity of Infection	New Lesions After Treatment Begun	Recurrence
B. H.	++	24 hrs.	None
B. D.	++	24 hrs.	None
G. H.	++	None	None
G. H.	++	None	None
G. B.	+++	48 hrs.	None
B. H.	++	None	1 week
B. H.	++	None	1 week
B. K.	++	None	1 week

+ = 1 to 3 blebs; ++ = 3 to 10 blebs; +++ = more than 10 blebs.

TABLE 2.—Results in Patients Treated with Ointment Containing 333 Units of Penicillin per Gram

Patient	Severity of Infection	New Lesions After Treatment Begun	Recurrence
B. L.	+	None	12 days
G. A.	+	None	None
B. S.	++	None	None
B. H.	+++	None	None
B. H.	++	None	None
B. K.	++	24 hrs.	None
B. P.	+++	None	None

+ = 1 to 3 blebs; ++ = 3 to 10 blebs; +++ = more than 10 blebs.

of the study the ointment was made with 250 units of penicillin to each gram, but this was later increased to 333 units to each gram.

Each new case of impetigo neonatorum was strictly isolated. The exfoliated membrane of epidermis, which constitutes the bleb, was completely removed by means of alcohol on cotton. Penicillin ointment was applied generously to the moist red base which remained and to the surrounding area of skin. The ointment was applied at least twice daily. No bath was given until the lesions were completely dry. At the time of discharge from the hospital, the mother was instructed to follow the same routine for at least one week, or until there were no lesions present.

RESULTS

In the 14 cases in this series there were no new lesions after the treatment had been in effect for forty-eight hours. After a maximum of three days all the lesions appeared to be dry and healed. In 3 instances, however, there was a recurrence of the condition after the patient had been home from the hospital more than one week. There was no apparent correla-

tion between these and the severity of the disease, as 2 of the cases were of only moderate severity and the other was mild. It should be noted that each recurrence was after treatment had been discontinued and baths had been started.

COMMENT

In many clinics sulfonamide ointments have supplanted 1 per cent aqueous gentian violet, 3 per cent ammoniated mercury ointment and other agents formerly¹ used in the treatment of impetigo neonatorum. Treatment by this method is admittedly more effective, but the danger of sensitization² of the patient makes its use inadvisable. Penicillin ointment, on the other hand, is not only effective but also without danger of side effects. Impetigo neonatorum is a hospital disease, and penicillin ointment can and should be freshly prepared in the hospital pharmacy.

414 West Franklin Street.

ODOROUS WOUNDS AND FISTULAS

W. WAYNE BARCOCK, M.D., PHILADELPHIA

Fetor from intestinal and urinary fistulas or from incontinence, suppurating wounds, necrotic tumors or gangrene permeates the room or ward, to the great distress of other patients and the disgust of attendants and visitors. The odor clings to the clothing of those in the room, surrounds the diet tray and renders the food unpalatable, and seeps through the corridors of the hospital, suggesting that even modern hospitals have characteristically unpleasant odors. How often, as one passes down the hall, is one conscious that the patient in room 27 is either incontinent or has a urinary fistula, while the odor in the vicinity of 36 indicates that the occupant has a colostomy. In a distant, sterile operating room one may suddenly realize that a patient with an extensive burn has been brought to the floor for skin grafting. Even on opening the front door of a hospital I have recognized the stench from a patient with gas gangrene on an upper floor. Methods for overcoming these odors, apart from vigilant and untiring nursing attention, now difficult to obtain, apparently are not generally understood, or at least are not used. Perfumes or pungent antiseptics about the bed of the patient as a rule are undesirable and quite inadequate. The wick protruding from the bottle of a commercial deodorant is helpful and has a less objectionable odor but does not screen the source of the trouble, which is the patient's body and dressings.

There are two simple agents which I have found very effective in deodorizing the patient, his dressings and the bed coverings. If the wound, fistula or opening from which there is odorous emanation is covered with several layers of gauze or cotton saturated with a 1:300 to 1:500 aqueous solution of potassium permanganate, which has little odor, escaping gas, solid or liquid material may be entirely deodorized. All that is required is that the offensive area and discharge be completely covered, that the dressings remain wet and that the permanganate solution be reapplied from time to time, as it loses its deodorizing qualities by oxidation. The permanganate solution is a useful wound dressing and rarely irritates the skin or delays healing. However, it stains bed linen as well as the skin a dirty brown, which is not removed by ordinary washing but which may be decolorized by a solution of oxalic acid or other chemical, with possible detriment to the fabric. Hospital authorities therefore may have reason to object to the use of permanganate at the bedside.

Another potent deodorant, which does not stain fabrics, is bromine used in solutions of 1:500 to 1:2,000. The 1:500 solution has a pungent odor and may be irritating to sensitive

From the Surgical Department of Temple University Hospital.

surfaces and the nasal mucous membranes. Such a strong solution is to be used only in extreme cases, although little odor of the bromine may pass through the outer dressings and bed coverings into the air of the room. Compresses wet with such a strong solution may be used to cover a gangrenous limb. Solutions of 1:1,000 to 1:2,000 may be applied on gauze or other absorbent dressings for days over the perineum or other odorous parts with little or no irritation of the skin. It is necessary to moisten the dressings from time to time, whenever the faint odor of bromine is lost, and when properly used the offensive odor or that of the chemical is hardly noticeable in the room.

The deodorant qualities of bromine I learned many years ago in visiting a laboratory for the commercial preparation of smallpox vaccine. In a large room there were many calves with abdomens covered with pustules, yet the air was free from unpleasant odor. The veterinarian in charge told me that bromine was the best agent he had found to eliminate the very objectionable odors from the calves, and of course the chemical was not applied to the animals.

This led me to the use of bromine solution on septic and offensive wounds. Not only is the odor immediately overcome, but sloughing wounds usually develop red firm granulations, become clean of necrotic tissue and heal rapidly. Offensive fistulas covered with layers of gauze or pads wet with weak bromine solution give little objectionable odor, the surrounding skin is not irritated and fabrics are not stained.

As bromine solution is decomposed by light and becomes colorless and inert, it should be kept corked in brown glass bottles.

3401 North Broad Street, Philadelphia 40.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report. HOWARD A. CARTER, Secretary.

TECA TWO-CIRCUIT HYDROGALVANIC THERAPY APPARATUS NOT ACCEPTABLE

Manufacturer: Teca Corporation, 220 West Forty-Second Street, New York.

Now and then the Council on Physical Medicine is called on, in order to fulfil its assumed obligations to the medical profession, to investigate and render reports on devices or methods which have not been submitted to the Council if it considers such reports important to public health and welfare.

The Teca Hydro-Galvanic Therapy apparatus falls in this category. The equipment consists mainly of a galvanic generator with two independent circuits, each with its own milliammeter, intensity control and polarity switch. One hundred and fifteen volt alternating current is rectified by a selenium rectifier. By means of a switch both circuits can be powered by an independent battery, if the operator desires to use direct current generated by a battery. The controls are arranged to permit one current, if the operator prefers, to be generated by a battery and the other current by the rectifier. The machine is claimed to be ground-free, and treatments may be given in any enameled or porcelain bathtub or in four individual tanks for treatment of all extremities. The electrodes are made of solid carbon and are completely encased in wooden containers. The manufacturer believes that the apparatus is an improvement over older types of equipment for galvanic baths. The firm claims that the two circuit generator allows flexibility of electrode grouping and that a general as well as local treatment can be administered at the same time.

The physiologic effects of the Teca Bath are said to be general body or general muscular stimulation, according to the type of current, and acceleration of metabolism and a slight lowering of blood pressure.

The clinical claims for the Teca Bath in published advertising matter include arthritis, rheumatism and allied conditions, neuritis, sciatica, neuralgia, chronic pelvic inflammations, parametritis, menstrual disorders, constipation and metabolic disorders such as obesity.

In the Council adopted article "Evaluation of Methods Used in Physical Therapy" (Handbook of Physical Therapy) it is recorded that results from physical therapeutic measures must be carefully evaluated and in order to evaluate the effects of physical therapy: "Observations with the particular form of treatment must be controlled and checked in a series of patients without the treatment. The number of observations must be so large as to minimize some of the disadvantages of random sampling." The evidence available, in the opinion of the Council, does not meet this criticism and therefore does not substantiate the therapeutic value of the Teca Bath (for the aforementioned reasons).

Other questionable points on which the evidence is not clear:

1. What is the therapeutic value of regrouping the circuits?
2. What is the therapeutic value of two independent circuits?
3. Why is it necessary to use one battery circuit and one alternating current supply circuit?
4. What is the chemical composition of the products used in the solution?

The Council on Physical Medicine voted not to include the equipment in its list of accepted devices because of the lack of critical therapeutic evidence to substantiate the claims made for the device.

The foregoing report was sent to the Teca Corporation prior to publication in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION. The manufacturer disagreed with the report of the Council and requested that it be held in abeyance awaiting additional information.

The manufacturer presented the names of several physicians who had had experience with the Teca Bath. The Council solicited information from these physicians and asked for an account of their experiences with the product. The Council gave careful consideration to their replies but found no convincing evidence which would warrant a change in the decision of the Council.

After due deliberation, the Council voted to reaffirm its previous stand and not to include the Teca Two-Circuit Hydrogalvanic Therapy Apparatus in its list of accepted devices. The Council will reconsider the appliance without prejudice when adequate information is submitted.

Council on Foods and Nutrition

ACCEPTED FOODS

The following additional foods have been accepted as conforming to the Rules of the Council on Foods and Nutrition of the American Medical Association for admission to Accepted Foods.

GEORGE K. ANDERSON, M.D., Secretary.

PREPARATIONS USED IN THE FEEDING OF INFANTS (See Accepted Foods, 1939, p. 156)

Heinz Company, Pittsburgh.

HEINZ STRAINED VEGETABLES AND LAMB WITH MILK AND CEREAL contains lamb carcass, lamb broth, rice, potatoes, carrots, celery, onions, salt, milk, cornstarch and water.

Analysis (submitted by manufacturer).—Total solids 11.82%, total sugar as sucrose 0.88%, acidity as citric 0.08%, protein (N \times 6.25) 2.06%, ether extract 1.35%, crude fiber 0.50%, ash 0.88%, salt, 0.5%, total carbohydrates other than crude fiber, by difference 7.05%, calcium 20.0 mg. per hundred grams, phosphorus 22.0 mg. per hundred grams, iron 0.6 mg. per hundred grams, copper 0.12 mg. per hundred grams.

Calories.—0.49 per gram, 14 per ounce.

Intensin.—

SATURDAY, DECEMBER 15, 1945

THE HOUSE OF DELEGATES SESSION

The end of the war made possible a session of the House of Delegates of the American Medical Association in Chicago during the period from December 3 through December 5. Practically a full attendance assembled, with delegates from all the constituent bodies and from the scientific sections and with representatives of the councils and other official bodies of the Association. The addresses of the Speaker of the House, the President-Elect and the President and the reports of trustees and officers appear in this issue or have been previously published. These were referred to the reference committees of the House of Delegates, and the final actions taken will be included in the proceedings to be published in THE JOURNAL during this week and the weeks to follow.

The Board of Trustees referred to the House of Delegates the address of President Harry S. Truman and the Wagner-Murray-Dingell bill, which were recently discussed in THE JOURNAL. Among the most significant of all the actions taken by the House of Delegates was the adoption of the report of the Reference Committee on Legislation and Public Relations, under the chairmanship of Dr. Edwin S. Hamilton of Illinois, which defines the policy of the American Medical Association on these proposals. As might be expected, the House of Delegates expressed its opposition to federal compulsory sickness insurance as proposed by the Wagner-Murray-Dingell bill and also to the extraordinary proposals made by Senator Pepper in his bill for maternal and infant care.

Among the many problems considered by the House of Delegates, those of first importance related to the physicians still in military service and those now being discharged. By direction of the House of Delegates a new Committee on Military Service has been established which is to give careful consideration to all the communications that have been received from men in the service

in order that the difficulties that have prevailed in this war may be overcome in any future emergency. The Committee on Postwar Medical Service is being charged with many of the problems of the returning medical veteran; the House of Delegates requested the Board of Trustees to develop the Bureau of Information on a permanent basis to intensify the activities now under way for aiding the returning veteran in securing internship or residency or graduate education and also with information as to suitable locations, licensure and similar matters that are to him of intimate concern.

Much of the time of the House of Delegates was occupied, particularly in the executive session, with the internal operations of the Association: the authority and functions of the Board of Trustees, of the Council on Medical Service and Public Relations and the work of various officers and bureaus in the headquarters office. By definite action the House of Delegates clarified these responsibilities.

Many resolutions were introduced in the House of Delegates relative to economic, social and scientific questions, all of which were referred to the appropriate reference committees and on all of which there were decisions. Especially significant were the action establishing a Section on General Practice as a permanent member of the scientific sections and the recommendation for a new by-law which will provide for two meetings of the House of Delegates each year, thus enabling the representative body of the Association to express promptly the policies of American medicine on most of the large problems that affect the medical profession.

The opening meeting for 1945 was marked by the inauguration of the new president, Dr. Roger I. Lee of Boston, whose address entitled "What is Adequate Medical Care?" was published as the leading article in THE JOURNAL last week. An unusual feature of this meeting was the presentation to Brigadier General Fred W. Rankin of the Distinguished Service Medal with a citation recognizing his military service. In making this presentation Dr. Roger I. Lee called attention to the pardonable pride which the Association takes in the fact that more than 60,000 physicians served in the armed forces. In introducing Brigadier General Noyes, who conferred the decoration, Dr. Lee said:

Since the outbreak of World War II, 227 have been reported killed in action and 409 died in military service. Moreover, up to the first of December 1945 physicians have been distinguished by recognition with citations and medals in great numbers for a variety of distinguished services, which varied from organizations that have saved the lives of thousands to individual discoveries which have achieved worldwide recognition. The Bronze Star was conferred on 297 physicians for exceptional conduct, including bravery equal to that of the most courageous of fighters under the most hazardous of conditions. Physicians have at the peril of their own lives entered the hold of vessels burning and sinking at sea to care for the wounded and to bring them out. Physicians have gone into the midst of exploding

shells to administer first aid and blood transfusions to the wounded. The Silver Star has been given to 100 physicians, the Legion of Merit to 145 physicians, the Soldiers Medal to 46 physicians, the United States of America Typhus Medal to 34 physicians, the Medal of Honor to 3, the Navy and Marine Corps Medal to 17, the Navy Cross to 14. Among the miscellaneous citations have been the awarding of the Croix de Guerre, the Cross of the Knight Commander, the Italian Cross for War Merit, the Medal of Distinction, and other foreign decorations. And finally, the Distinguished Service Medal has been awarded to Col. James O. Gillespie, Major Gen. James C. Magee, Brig. Gen. Leon A. Fox, Brig. Gen. Percy J. Carroll, Major Gen. Norman T. Kirk, Major Gen. George C. Dunham, Brig. Gen. Joseph I. Martin, Brig. Gen. John A. Rogers, Capt. George B. Dowling, Brig. Gen. Malcolm C. Grow, Major Gen. Morrison C. Stayer, Rear Admiral William Chambers, Major Gen. Warren F. Draper, Major Gen. George F. Lull, Comdr. James J. Sapero and Capt. Emile G. Schuster.

The list of the members of the medical profession who have been decorated at war is at present far from complete. No doubt many others will yet receive decorations for remarkable accomplishments. Perhaps some of the names of those who have been recognized have been missed. Symbolic of all of these decorations, therefore, is the award made to Brigadier General Fred Rankin, a former President of the American Medical Association.

The election of officers brought to the Association as President-Elect Dr. Harrison H. Shoulders. Nashville, Tenn., for many years Speaker of the House of Delegates; as Vice President Dr. William R. Molony, Los Angeles, long a member of the House of Delegates from California; for the Board of Trustees three new members, Dr. John H. Fitzgibbon of Portland, Ore., Dr. James R. Miller of Hartford, Conn., and Dr. Dwight H. Murray of Napa, Calif. Dr. Olin West, for many years Secretary of the Association, was reelected unanimously, as was also Dr. Josiah J. Moore, the treasurer. Dr. Herman G. Weiskotten of Syracuse, N. Y., was reelected to the Council on Medical Education and Hospitals; Dr. Henry R. Viets, Boston, to the Council on Scientific Assembly, and Dr. Louis A. Buie, Rochester, Minn., to the Judicial Council. To the Council on Medical Service and Public Relations were elected Dr. Alfred W. Adson, Rochester, Minn., Dr. Walter B. Martin, Norfolk, Va., and Dr. Raymond L. Zech, Seattle.

The next annual session of the Association will be held in San Francisco, July 1-5, 1946. Plans were developed for the celebration of the centennial of the Association, which will be held in Atlantic City in 1947.

THE PRESIDENT-ELECT: DR. HARRISON H. SHOULDERS

On request of many delegates, Dr. Harrison H. Shoulders, Speaker of the House of Delegates since 1938, resigned his position at the opening of the elections and was thereafter nominated and elected to the position of President-Elect of the American Medical Association. From 1930 to 1938 Dr. Shoulders served continuously as a delegate from the Tennessee State Medical Association. He was elected Vice Speaker of the House of Delegates in 1935 and reelected in the two years following, becoming Speaker of the House in 1938. He was secretary of the Tennessee State

Medical Association and editor of its *Journal* from 1927 to 1945. Dr. Shoulders, who is now 59 years old, is a native of Tennessee. Following study at the Potter Bible College in Kentucky he went in 1904 to the University of Nashville Medical Department, where he received the degree of Doctor of Medicine in 1909. He was married on Dec. 5, 1922, so that the day of his election to the presidency of the American Medical Association fell, by a fortunate coincidence, on his twenty-third wedding anniversary.

Following his internship at St. Thomas Hospital in Nashville he became resident surgeon at the Forts Infirmary, which position he held until 1912. He then became assistant sec-

HARRISON H. SHOULDERS, M.D.
PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

retary and executive officer of the Tennessee State Department of Health and held this position until 1917. In 1919 he went for postgraduate study to the New York Postgraduate Hospital, after which he was resident surgeon at St. Luke's Hospital and the Hospital for Ruptured and Crippled in New York City through 1921. He served as a captain in the Medical Corps of the U. S. Army overseas from 1917 to 1919. He was certified as a member of the Founders Group by the American Board of Surgery; he is also a Fellow of the American College of Surgeons, is assistant professor of clinical surgery at Vanderbilt University Medical School and assistant visiting surgeon at Vanderbilt University Hospital. He was an organizer and served as first president of the Nashville Surgical Society and has written many articles on surgery in the medical literature.

The service of Dr. Harrison H. Shoulders to American medicine has been distinguished by an intense belief in the spiritual mission of the physician as a healer. In his addresses to the House of Delegates he has emphasized constantly the high ethical purpose of medical practice and the dedication of the physician to his profession.

STUDIES ON STREPTOMYCIN IN MAN

Intravenous injection of a single dose of 600,000 units of streptomycin in man, according to Zintel and his co-workers,¹ was followed by a concentration of the drug in the blood which decreased at a more or less uniform rate for six hours. Fifteen minutes after administration the average blood streptomycin level was 32.8 units. At the end of six hours a small amount of streptomycin, 4.9 units per cubic centimeter, was still detectable in the blood in the majority of instances. When the same amount of streptomycin was administered as a single dose subcutaneously, the maximum blood level was not attained until two or three hours later. An additive effect was obtained when the drug was administered every three hours. When 3,000,000 units of streptomycin in 3,000 cc. of a 5 per cent glucose solution was administered daily by continuous intravenous infusion, the blood streptomycin levels usually varied between 20 and 60 units of streptomycin per cubic centimeter of blood. The authors administered streptomycin orally at the rate of 1,000,000 units a day to 6 patients and found that only occasionally was there any streptomycin in the blood, and then in minimal amounts, namely 1 to 6 units per cubic centimeter of blood. Most of the drug was eliminated in the feces. Apparently streptomycin passes through the gastrointestinal wall with difficulty, since little appears in the blood when given orally and only small amounts are found in the gastrointestinal tract when administered intravenously. Anderson and Jewell² did not detect any streptomycin in the serum at any time after oral administration of 600,000 units of streptomycin dissolved in 100 cc. of tap water.

Zintel and his co-workers found that streptomycin, when administered intravenously, subcutaneously or intramuscularly, is excreted largely in the urine. The highest urine concentration of the samples taken three hours after the injection of 600,000 units of streptomycin was 520 units per cubic centimeter. Following parenteral injection the drug was found to be distributed throughout most body fluids, such as blood, urine, ascitic fluid, pleural fluid, aqueous humor, vitreous humor, amniotic fluid and bile. Small amounts of the drug appeared in the spinal fluid in healthy per-

sons. These authors found no evidence of either hepatic or renal damage from administration of a single massive dose of streptomycin. Anderson and Jewell, in their studies on man, obtained much the same results. They found that the curves of the serum concentrations of the drug after intramuscular or intravenous injection did not differ significantly except during the first few minutes after injection. They also found that intrathecal administration of streptomycin in doses up to 20,000 units does not produce signs of meningeal irritation. With doses of 10,000 to 20,000 units an appreciable concentration of the drug can be maintained in the cerebrospinal fluid for at least twenty-four hours. Serious toxic reactions did not follow the injection of single doses of streptomycin in amounts up to 600,000 units or after the continued administration of the drug for periods of two to three weeks in doses totaling 2,725,000 to 18,150,000 units.

Current Comment

DR. GEORGE R. MINOT RECEIVES THE DISTINGUISHED SERVICE MEDAL

To the list of eminent physicians on whom the Distinguished Service Medal of the American Medical Association has been conferred, the House of Delegates at its meeting in 1945 added the name of George Richards Minot. His contribution to our knowledge of the causes and methods of control of pernicious anemia has been recognized throughout the world. The blood is unquestionably the most important of all the tissues of the body. Once every person who developed pernicious anemia died of that disease. Today, by the discovery made by George R. Minot and his associates, those with pernicious anemia are given years of life in which they live to all intents and purposes as normal human beings. This great discovery opened a new pathway into the field of research on blood, along which great numbers of investigators have traveled to build higher and higher the structure of medical science. The significance of Dr. Minot's discovery is perhaps best explained in the following paragraph from his writings:

Dietary deficiency may arise not only because of an improper intake of one or more substances required by the body but also because established disease may prevent the formation, absorption or utilization, or cause abnormal loss from the body, of necessary substances. The effects of extra demands of organisms are always to be reckoned with. The physiological strain of child bearing requires dietary factors to be often much greater than the standard requirements for women. Moreover, since the material diet in pregnancy and lactation inevitably affects the well being of the infant, the health of the whole population depends to a greater or less extent on the nutrition of the mothers. Fundamental research bearing on nutrition in such fields as chemistry, as well as practical applied studies, offers a basis endeavor for better public health. There are today throughout the world multiple opportunities for the prevention of many sorts of disorders by better nutrition. The partaking of proper food is excellent preventive medicine and upon it depends the integrity of man. Men with different types of training must seek for more information on nutrition and carry forward the work so that the ultimate goal will be nearer for those who follow us.

2. Anderson, D. G., and Jewell, Marjorie: The Absorption, Excretion and Toxicity of Streptomycin in Man, *New England J. Med.* 233: 483 (Oct.) 1945.

Dr. Minot has been previously honored with honorary degrees from many universities and medical societies, with the Kober gold medal of the Association of American Physicians, the Cameron prize of the University of Edinburgh, the gold medal of the National Institute of Social Sciences, the gold medal and award of the *Popular Science Monthly*, the Moxon medal of the Royal College of Physicians, London, the John Scott medal of the city of Philadelphia, the gold medal of the Humane Society of Massachusetts and, together with William P. Murphy and George H. Whipple, the Nobel prize in medicine for 1934. The Distinguished Service Medal of the American Medical Association is thus added to many other distinctions given by the world to a great investigator.

ELECTRICAL TRANSCRIPTIONS LIST AUGMENTED

On page 1111 of this issue of *THE JOURNAL* appears an announcement of another series of electrically transcribed radio broadcasts available for local medical societies from the Bureau of Health Education. The new series deals with mental hygiene in terms of everyday living problems as indicated by its title, "Why Do You Worry?" The material was prepared by psychiatrists and the program is summarized by them, but it is not psychiatric in character or approach. It is a simple sensible program on adjustments to everyday living problems with suggestions of how and when psychiatric medicine can be of aid. This is the first of several series now being planned dealing with special fields of medicine. Programs in the field of pediatrics are now under consideration. At the same time the Bureau has dropped a series under the title "American Medicine Serves the World at War," which has lost its timeliness with the cessation of hostilities. The discontinuance of this series offers the first opportunity to estimate the service rendered by transcriptions in relation to cost. Eliminating general overhead and intraoffice costs and based entirely on the cost of master records and transcriptions, the preparation and lending of this series for six hundred and eighty local broadcasts represented a cost per individual broadcast of \$1.33. There is no way of estimating the local audience, but at the minimum this would seem to be an economical way of reaching the people. With the addition of programs in mental hygiene and the elimination of strictly wartime recordings there remains a transcription library available for local medical societies of ninety-five separate programs covering emergency situations in the home, communicable disease topics, public health, personal health in middle years, living and liking it, mental hygiene, summer health suggestions, and special material for elementary school children. The local response to the availability of these platters has been good, especially from the medical societies of Texas, Pennsylvania, Wisconsin and Arizona. There are many platters available for lending which would be far more useful on the air than on the stock shelves of the Bureau of Health Education.

SIMULATED BLOOD PRESSURE RESPONSES IN LIE DETECTOR TESTS

Instruments for recording changes in blood pressure, pulse and respiration have been used effectively in criminal investigations to determine whether or not the person being tested is telling the truth. The recordings of approximately 20 per cent of the subjects thus tested are too indefinite to permit the examiner to make a diagnosis of deception. Experiments conducted by Reid¹ have revealed that ambiguities in the blood pressure tracings are frequently induced by some type of unobserved muscular movements. He has demonstrated in experiments on himself that all the typical blood pressure responses of deception can be produced at will, and that recorded evidence of muscular movement is in itself a criterion of deception. The ambiguities in the recordings of the blood pressure may be accomplished by the use of muscular contraction or by muscular pressure. Reid believes that a percentage of these discrepancies in the blood pressure tracings may be the result of deliberate attempts on the part of the subject "to beat the machine." To eliminate this possibility, Reid has devised an instrument which consists essentially of a closed pneumatic system in which inflated rubber bladders placed under the forearms and thighs are connected to three separate tambour units, which permits the recording of any muscular exertion by the subject's feet, legs, arms and hands. The experiments with this device indicate that both muscular contractions and the application of pressure to skeletal muscles which can influence the blood pressure tracing may now be detected by new devices which also serve to locate the regions from which the muscular movements emanate. The experiments also reveal that not all subjects can influence their blood pressure curve by muscular action. The author believes that examiners will have a means of separating true patterns of deception from fraudulent ones with his technic.

TEACHING INSTITUTIONS AND ADJACENT VETERANS' HOSPITALS

Elsewhere in this issue (page 1100) appears an announcement of the details of the plans developed by the Veterans Administration for complete cooperation with teaching institutions and veterans' hospitals in the proximity. For the first time the opportunity exists for providing the veteran with the highest type of medical service through the use of the civilian physicians and also for developing the standards of medical care in veterans' hospitals by bringing them up to the qualifications necessary for internships and residencies. The medical profession should do its utmost to give the fullest possible cooperation to Major General Hawley and his associates in order that the fullest success may result. This is important primarily for the veterans who will be served but also for the advancement of medical science.

MEDICINE AND THE WAR

PLANS FOR COOPERATION BETWEEN TEACHING INSTITUTIONS AND VETERANS' HOSPITALS

Introduction

NOTE.—Following are the details of the plans of cooperation between teaching institutions and veterans' hospitals and also for the use of civilian practitioners in the care of the veteran. The description includes the appointments to be given to civilian physicians and the terms of their employment. There follow also letters that have been sent to the deans of medical colleges, who will be asked to cooperate fully in the development of the plan.—ED.

This is a statement of General Hawley's plan for the immediate future for the staffing of veterans' hospitals and for cooperation with teaching institutions. There will probably have to be some variations made in the plan for individual hospitals according to the necessities, but the plan should work if:

1. Those in charge of administration of hospitals want it to work;

2. There is cooperation between hospitals, medical schools and consultants appointed by the Surgeon General of the Veterans Administration.

The object of these changes is to give better care to individual patients by bringing into the veterans' hospitals the best trained men obtainable in civilian practice of medicine. This can be done so far as consultants are concerned by putting consultants on a basis which will allow them to devote part of their time to veterans' hospitals and part to their own private practice and teaching.

It is realized by the Surgeon General that it was the complete cooperation of the civilian doctor, fitted into his proper sphere of interest and ability in the Army, that made the service to the G. I. outstanding in the field of military medicine and surgery. It is planned that this same type of service will be continued in the Veterans Administration, the only difference being that neither the doctor nor the patient will be in uniform.

The Plan

There will be three classes of service.

Senior Consultants (senior consultants—present consultants).—This staff in most hospitals near teaching centers already exists and is functioning. There will be no change unless recommended by the local consultants to the Surgeon General and the manager of the hospital. However, senior consultants must be fitted into the general plan. If at present there are senior consultants that cannot be fitted into this plan except with difficulty, the present incumbents must be replaced.

Consultants (consultants—new consultants).—These men, who are essentially attending men but who under existing laws must be designated as consultants because there is at present no provision for attending men, are to be appointed by agreement of the local consultants appointed by the Surgeon General and the manager of the hospital. These men will be appointed immediately on recommendations of the local "deans' committees." They will be selected from the staffs of medical schools or recommended by local consultants and will be drawn at present from the ranks of discharged medical officers wherever possible; they will be men who have been certified by their respective boards; they will act as attending men act in civilian hospitals.

Consultants will be paid on a per visit basis, no two visits to be charged for on the same day, and their compensation will not exceed \$6,000 per year, on an average monthly basis of \$500. Their duties will be those expected of an attending physician in any university hospital. They will be assigned to their individual wards and will be responsible to the chief of service, clinical director or manager as may seem best in the administration of the individual hospital.

Ward Officers (ward officers—residents).—Under existing laws there is no provision for residents. Such men now must come in under civil service and meet necessary physical qualifications. Arrangements have been made for immediate appointment of applicants by local managers on the recommendation of approved local "deans' committees" after completion of necessary form 57. Such men may go to work immediately.

These men will be essentially residents and will be put on a rotating service in their respective specialties with the idea that they will have opportunity to prepare for their boards under consultants and senior consultants. Teaching institutions with which the veterans' hospitals are cooperating will be responsible for furnishing instruction in the basic sciences prescribed by various boards.

At present ward officers will be paid under civil service, starting at \$3,640 a year, not including room and board. When the law is changed these men will be on a different financial basis, probably with lower pay but with room and board. Any acceptable ward officer at present on the service of a veterans' hospital associated with a teaching institution, who has given satisfactory service, may be placed in line for continuing training for his chosen board. Ward officers wishing to fit themselves for board examination should apply to their managers and consultants to the Surgeon General and shall be put in line for such training only on their recommendation.

Ward officers will be selected first from the ranks of discharged junior medical officers who wish to prepare for their boards in various specialties. Their services will be rotating services through all the subspecialties of medicine and surgery, including orthopedic surgery. After their first complete rotation they should be allowed whenever possible to specify their preference as to the subspecialty. These services can run as long as five years in veterans' hospitals. One year of this will be in basic sciences, part of which can be given within the veterans' hospital. Such branches as pathology frequently can be given entirely within the institution; physiology, anatomy, biochemistry and others will have to be given by medical schools associated with veterans' hospitals.

It is suggested that the receiving service be continuous with the ward service and that each specialty should be represented on the receiving service rather than having the latter completely separated from ward service as is done in some institutions. This will make for continuity of diagnosis and treatment.

Local medical authorities will be responsible for offering courses to men preparing for boards. In most cases these can be paid for under the G. I. Bill of Rights. For the next year these courses will have to be held in abeyance because of lack of ward officers and the inability of some schools to provide this instruction immediately. When the attending staff is appointed and the schools can show the Council on Medical Education and Hospitals that they are prepared to give courses in the basic sciences, the boards will be requested to give their approval of the institution as a postgraduate institution for teaching. I have already been assured by the boards of surgery and medicine that their full cooperation will be forthcoming.

Permanent Staff.—Where there already exists a chief of service who is competent, who has been giving good service and who is a member of a board, of the College of Physicians or of the College of Surgeons, it would seem best not to interfere with his status, at least at this time, if he is a man of ability and vision and approves of the development of the proposed plan. It is suggested that he choose one of his ward officers to act as his adjutant to help coordinate the various services being handled by the consultants, to assist them at various times as the chief of service may see fit. This will enable the adjutant to prepare for his board in his specialty. If, however, the professional qualifications of a chief of service so warrant, he may be promoted to a hospital not immediately connected with a teaching institution to raise its standards.

If this plan does not seem satisfactory because of incompatibility of some sort, and a senior consultant or a consultant can be found who will devote enough time to the service to coordinate it and run it more satisfactorily, it would be up to the local administration to work out the plan.

Modus Operandi for Appointing Incoming Staff of Various Grades at Veterans Administration Hospitals

Senior Consultants.—Senior consultants should be recommended by the "dean's committee" of the medical school affiliated with the veterans' hospital. This group of consultants now exists in most veterans' hospitals near medical centers. They will be appointed from outstanding men of professorial rank and will act as supervisory consultants to the manager, chiefs of staff and the staff of the hospital and will guide the teaching as well as the clinical service in the hospital. Their compensation will be fixed, as now, on the basis of the amount of time spent and the kind of work performed during that time.

Consultants.—These men are essentially attending men and will be selected from discharged medical officers who have held teaching positions in medical schools prior to military service. They should be Fellows of the American College of Surgeons or the American College of Physicians or specialists certified by one of the specialty boards. If they have not passed the second half of the board examination because their military service prevented this, they may be recommended by the "dean's committee" because of their past record; it is permissible to use them as consultants, since they will be coming up for the second half of the board examination within the next six months or a year.

The method of appointment is as follows: They shall be recommended to the manager of the hospital for a particular service, medical, surgical or other specialty. There shall be included with the recommendation a full record of their training and accomplishments, positions held, research work, publications and army service record. Chief medical officers should transmit recommendations to the Surgeon General of the Veterans Administration for attention of Director of Medical Personnel. Recommendations should be sent by air mail, and we have assurance that appointments will be made promptly and returned to the manager promptly so that these men may be put in service immediately.

Ward Officers.—These men are to be selected at present from the ranks of discharged medical officers whenever possible by application to the "dean's committee" with their application. The "dean's committee" shall classify these men A, B or C according to ability and attainments. After survey the local "dean's committee" will recommend to the managers for immediate appointment sufficient personnel to fill all services necessary for the proper care of patients and teaching desired in future veterans' hospitals. The manager in consultation with the "dean's committee" shall select for recommendation to the Surgeon General a number sufficient to fill all vacancies as necessary in the veteran's hospital.

It should be specified to applicants that nobody will be appointed who does not wish to prepare for one of the specialty boards, with the direct understanding that they will remain in the veteran's hospital on service until they have qualified for such board, if the medical school affiliated with the Veterans Administration hospital training is approved by such boards as a suitable place to give such training.

If any ward officer shall prove unsatisfactory, in the opinion of the manager of the hospital and the "dean's committee," he can be transferred to another medical service in the Veterans Administration which will not necessarily prepare him for board certification, and the "dean's committee" may refuse to recommend him for such board examination.

Any individual now on service at a Veterans Administration hospital may apply for complete training for his board through the manager to the "dean's committee," and the fact that he is on service in the veteran's hospital shall not prejudice in any way his appointment to a place which will prepare him for such board. It is, however, to be understood that in spite of excellent work in one department or one section of one department performed in the past, this does not release him from any part of the rotating residency plan or give him any preference over those who are entering from the outside. It will be within the province of the "dean's committee," however, to give him credit for work already done satisfactorily in the Veterans Administration hospital.

To expedite necessary appointments and to assure the immediate professional functioning of competent personnel, arrangements for appointment have been made in the following manner: The managers of local veterans' hospitals will have the authority to appoint and put to work immediately applicants recommended by the "deans' committees" as desirable and necessary for proper functioning of veterans' hospitals as grade A medical installations. The procedure is simplified so that such applicants on the completion of the proper forms may start without further delay. This latitude is allowed because applicants will be recommended by the aforementioned "deans' committees."

Letter No. 1 Sent to Deans of Medical Colleges

Under the new plan of the Acting Surgeon General of the Veterans Administration we expect to make arrangements with the medical schools of this country, which are located near veterans' hospitals, to utilize their facilities to augment and improve staffs at the veterans' hospitals.

I am enclosing herewith plan of future cooperation with teaching medical institutions and veterans' hospitals in the immediate proximity. This is a statement of the plan we intend to follow.

I am also enclosing the modus operandi of this plan.

I have been authorized by the Surgeon General to put this plan into effect and on the receipt of your consent to willingness to cooperate, orders will be sent to the manager of the hospital in your vicinity.

The method of appointment will be recommendation of the "dean's committee," a committee consisting of the dean of medical schools and any members of his faculty of professorial rank he may desire to appoint. These committees are to be the sole judges of the professional standards to keep in the hospitals under their professional supervision.

For the Acting Surgeon General:
FOR PAUL B. MAGNUSON,
Director of Research and Education.
MAJOR WILLIAM T. DORAN,
Assistant Director of Research and Education.

Letter No. 2 Sent to Deans of Medical Colleges

This is in answer to your very kind acceptance of cooperation with the veterans' hospitals in establishing new high grade professional services. The plan of organization and modus operandi you are probably familiar with by now.

May I say that it will be up to the medical schools to keep the standards of your hospital at a place in medical education which will warrant the approval of all the specialty boards in each department, and the hospitals will be passed individually, by the specialty boards, not collectively. Your senior consultants will be your liaison officers between you and the medical service. They should first survey the hospital in consultation with the manager with the chiefs of various services.

Undoubtedly you will find some dead wood and it is imperative that dead wood should be eliminated wherever it is possible. The man who is interested and is a good doctor should be pushed onward. The man who is not interested except for the \$30 bell should be eliminated. This service should not be cluttered up with uncooperative individuals, and that goes from the manager down. I will say to you personally that if the manager is not cooperative, I want to know it.

The appointment of these men, both as consultants and as residents, is simple. They can be put to work within a week from the time you recommend them by the following method. The manager of the hospital and the chief medical officer of the hospital have the right under the present Veterans Administration rule to put consultants on a fee basis at any time and as many as necessary for the proper staffing of the hospital and service to the patient. We have just arranged today for the appointment of the residents, who will be full time employees and must come under civil service, and an order has gone out to all hospital managers where the hospitals are located near teaching institutions that ward officers who are the equivalent of residents can be employed the day their form 57 is filled out and they can be put on the pay roll of the hospital, with one exception, that is, if their tables of organization are filled the manager should be directed to send telegraphic request to

this office for authority for temporary appointment pending organization, so that the manager cannot say to you that his quota is filled and thereby hold an undesirable man in service.

A fee basis consultant whose assignment has no reference to a time element may be appointed without limit as to fee. It is distinctly understood that in such appointments no specific time is involved. A nominal fee of \$15 to \$25 per visit could be set with no requirement as to specific number of patients that must be seen at each visit. This sum can be increased to any reasonable amount as the situation may require and, in the cases of senior consultants, compensation will be given commensurate with a scale equal to the time devoted to equivalent professional work.

If it is possible to appoint a competent physiologist as senior consultant, we would like to have him make rounds with the medical staff and the surgical staff once a week. His fee can be fixed by you by recommendation to the manager.

I am enclosing a form 57 for your information. It is the standard form used in civil service and can be filled out in a short time by

your applicant for residency. Form 57 is available at all veterans' hospitals. To prevent ordering away through Veterans Administration channels all men appointed through recommendation of the "dean's committee" as ward officer residents, they should be specifically earmarked for such service so that they will not be confused with other full time personnel. I am also enclosing sufficient professional qualification forms that are self explanatory.

I want you to know how these things can be done so that the manager cannot refuse to do them. If you have any trouble please call this office long distance or telegraph, addressing your call to Major W. T. Doran or to me, room 826 Veterans Administration Building.

For the Acting Surgeon General:
For PAUL B. MAGNUSON,
Director of Research and Education.
MAJOR WILLIAM T. DORAN,
Assistant Director of Research and Education.

ARMY

235TH GENERAL HOSPITAL OBSERVES FIRST ANNIVERSARY

The 235th General Hospital, which was activated at Camp Barkeley, Texas, Oct. 10, 1944, recently celebrated its first anniversary at Les Milles, near Marseilles, France. The 235th assumed command of the installation on Dec. 22, 1944 as a thousand bed unit. A total of 7,291 patients, including American, Allied and German prisoner of war personnel, were admitted during the period from December 1944 to VE day. American personnel comprised 2,644 of this number, of whom 1,567 were battle casualties. The primary mission of the 235th General Hospital is to service personnel of the large Calas staging area near Marseilles. It maintains a hospital of 1,000 beds with a patient census of more than 800 at present.

HONORARY FLIGHT SURGEON OF THE FRENCH AIR FORCE

Col. Paul A. Campbell, Chicago, recently received an award of wings as an honorary flight surgeon of the French Air Forces as a result of his work in aeromedical research. The presentation of the honorary wings was made by Gen. J. A. Clerc, Air Surgeon of French Air Forces, during a recent inspection visit at the School of Aviation Medicine, Randolph Field, Texas.

Colonel Campbell recently returned from the European theater, where as a member of an air staff team studying medical services of the German air force, he traveled through Germany compiling medical data for study by Air Force personnel. As director of research of the school since 1942, Colonel Campbell personally supervised and directed many projects which have been instrumental in increasing the efficiency performance and safeguarding the health of combat crews.

NEW COMMAND OFFICER AT BEAUMONT GENERAL HOSPITAL

Col. George W. Reyer was recently named the new commanding officer of Beaumont General Hospital, El Paso, Texas, replacing Col. George M. Edwards, who has retired. Colonel Reyer's medical department career began in 1917, when he was commissioned in the Medical Corps Reserve. His experience with army hospitals started in Arizona and included Manila and Corregidor in the early twenties and Italy in World War II. In recognition of his work in Italy, as the head of the 300th General Hospital, Colonel Reyer received the Commander of the Cross of the Crown of Italy from the Italian government and the "Wreath of Merit" award.

165TH STATION HOSPITAL COMMENDED

The 165th Station Hospital was recently commended by Lieut. Gen. Robert L. Eichelberger, U. S. Army, commanding general of the Eighth Army in the Philippines, who stated, in the citation, "It is with great pleasure that I commend the 165th Station Hospital for its superior performance and outstanding devotion to duty during operations against the enemy

from Dec. 26, 1944 to June 30, 1945. The untiring effort and high degree of professional skill evidenced by all officers and enlisted men have contributed materially to the alleviation of suffering of the wounded and the survival of many who were critically wounded. The inspiring manner in which the 165th Station Hospital has carried out its mission reflects great credit on the Medical Department and on the military service as a whole."

1,250,000 MEN GIVEN PHYSICAL EXAMINATION IN OCTOBER

According to a recent release from the War Department, more than 1,250,000 men were physically examined during the month of October before being discharged from the Army. Major Gen. Norman T. Kirk, Surgeon General of the Army, stated that every man released from the service will be given the ultimate medical care before returning to civilian life. He also pointed out that, in order to speed demobilization, the complete physical check on the average soldier is performed by eight doctors in one hour, provided the man has no ailment.

ARMY AWARDS AND COMMENDATIONS

Colonel Otis O. Benson Jr.

An Oak Leaf Cluster to the Legion of Merit was recently awarded to Col. Otis O. Benson Jr., formerly of Tower, Minn., at present assigned as Air Surgeon for the AAF Center in Orlando, Fla. The citation stated that "Colonel Benson was the key man responsible for welding the medical section of the 15th Air Force into an integral, efficient organization. During a very important phase of the Italian-European operation, when it was of highest importance to carry on an all-out aerial war from highly malarial and disease-ridden areas, he initiated methods of prevention and control which soon brought the health of the 15th to an exceptional standard." Colonel Benson has also been awarded the Bronze Star and the Air Medal. He graduated from Rush Medical College, Chicago, in 1930 and entered the service July 31, 1931.

Captain Harold N. Cole Jr.

Capt. Harold N. Cole Jr., formerly of Shaker Heights, Ohio, was recently awarded the Bronze Star "for meritorious service in connection with military operations against the enemy at Cebu, Philippine Islands, from March 26 to April 5, 1945. When assaulting companies suffered a number of casualties due to the strong enemy resistance and fortifications, Captain Cole, although ill with yellow jaundice, refused to leave the battalion aid station. A number of times Captain Cole went forward with the assault companies under intense fire of the enemy so that he could give aid to the men as they were wounded. Captain Cole's expert care in giving aid to the wounded men saved many lives, and his being on the front lines giving aid was inspirational to all the men of the assault companies. Captain Cole's devotion to duty, disregard for his own safety and efficient treatment of the wounded men were in keeping with the high

traditions of the Medical Corps." Dr. Cole graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1942 and entered the service July 3, 1943.

Captain Emanuel Goldstein

Capt. Emanuel Goldstein of Plainfield, Iowa, was recently awarded the Purple Heart and the Presidential Unit Citation for service with the 22d Infantry Regiment. In November 1944 he was awarded the Bronze Star for "heroic achievement in connection with military operations against an enemy of the United States in the vicinity of Bucher, Germany, in September 1944. At the time when enemy artillery shells were falling within 40 feet of a self-propelled gun, Captain Goldstein, battalion surgeon, led a group of men to the tank destroyer in which a seriously wounded man was wedged. From an unprotected position in the turret of the vehicle, Captain Goldstein directed the safe removal of the wounded man. He then administered medical aid, which undoubtedly saved the man's life. The courage, calmness and devotion to duty displayed by Captain Goldstein are in keeping with the highest traditions of the military service." Captain Goldstein was also awarded the Oak Leaf Cluster to the Bronze Star "for heroic achievement in connection with military operations against an enemy of the United States in the vicinity of Grosshan, Germany, Nov. 29, 1944. While reconnoitering the area near a forward observation post for an aid station location, Captain Goldstein heard the cries for aid from two men wounded in a motor bombardment. At great personal risk he ran to them, administered immediate emergency treatment and carried them to a nearby road, where he had them evacuated to the aid station. While enemy artillery and motor shells were bursting close by, he administered blood plasma, which probably saved their lives. The courage and devotion to duty displayed by Captain Goldstein were instrumental in saving two lives and reflect credit on himself and the military service." Dr. Goldstein graduated from the State University of Iowa College of Medicine, Iowa City, in 1941 and entered the service July 8, 1942.

Major Thomas H. Pennock

The Bronze Star was recently awarded to Major Thomas H. Pennock, formerly of Wilmington, Del., "for meritorious service from April 15 to May 5, 1945 in southern Germany. During this period Major Pennock was assigned the mission of coordinating the medical services for an attached cavalry reconnaissance group in addition to the organic divisional cavalry reconnaissance squadron. Those organizations functioned as a separate combat command and moved rapidly, covering large areas, bypassing strong points of resistance and penetrating as deeply as possible into enemy territory. For this reason evacuation of wounded was necessary through enemy territory and frequently over long distances under very adverse conditions. In spite of these difficulties every wounded man in this organization received prompt medical care, in large measure due to Major Pennock's efforts. Frequently drawing enemy fire and crossing hostile territory, Major Pennock made daily personal contact with all elements of his command and by judicious and resourceful methods so employed the facilities at his command that wounded personnel were treated and evacuated promptly. By conserving the fighting strength of the aforementioned units Major Pennock has rendered meritorious service to this organization." Dr. Pennock graduated from Hahnemann Medical College and Hospital of Philadelphia in 1941 and entered the service Aug. 1, 1942.

Major Karl V. Larson

The Bronze Star was recently awarded to Major Karl V. Larson, formerly of Machias, Maine, who was cited "for meritorious service in connection with military operations against the enemy from June 18, 1944 to May 9, 1945 in France and Germany. Throughout this extended period of combat operations Major Larson demonstrated exceptional professional skill and judgment in performance of his duties as division artillery surgeon. Untiring in his efforts to maintain the physical condition and ever alert to guard against mental fatigue of the members of the division artillery units, his aggressive supervision and

insistence on simple measures to prevent disease were largely responsible for the excellent health of the command. Due to his expert guidance, nonbattle losses were negligible even during the rigorous Alsatian winter campaign, and his activities contributed greatly to the battle efficiency of the organizations under his medical supervision. The unstinting fidelity to duty displayed by Major Larson reflects great credit on the armed forces of the United States." Dr. Larson graduated from Albany Medical College, New York, in 1940 and entered the service Jan. 15, 1942.

Major Vance H. Marchbanks Jr.

Major Vance H. Marchbanks Jr., formerly of Little Rock, Ark., was recently awarded the Bronze Star "for meritorious service in support of military operations against the enemy from Jan. 4, 1944 to May 1, 1945." The citation accompanying the award declared that "Major Marchbanks, by professional skill and untiring effort, maintained an efficient medical center after setting up in an area without facilities. He constructed the medical center from salvaged materials. His sound judgment has contributed immeasurably to the combat achievement of his unit. He displayed profound interest in malaria and venereal disease control along with developing a coordinated program for each which resulted in no new cases of malaria and a decided drop in the venereal disease rate despite the highly infected area in which his unit was located. His knowledge and meritorious performance of duty have reflected great credit on his unit and the armed forces of the United States of America." Dr. Marchbanks graduated from Howard University College of Medicine, Washington, D. C., in 1937 and entered the service March 28, 1941.

Major Paul C. Samson

The Legion of Merit was recently awarded to Major Paul C. Samson, formerly of Oakland, Calif., "for exceptionally meritorious conduct in the performance of outstanding services in North Africa, Italy, France and Germany from March 9, 1943 to May 8, 1945." The citation accompanying the award reported that "as officer in charge of a thoracic surgical center, Bizerte, Tunisia, Major Samson inaugurated many advances in the care of thoracic injuries which became widely adopted in subsequent military campaigns in Europe. Major Samson has performed major surgical operations or supervised such operations on more than 500 severely wounded casualties suffering from injuries to the chest. As a result of his outstanding contributions many severely wounded soldiers suffering from wounds of the lungs recovered and returned to military duty, thereby reflecting great credit on Major Samson and the Medical Corps of the Army of the United States." Dr. Samson graduated from the University of Michigan Medical School, Ann Arbor, in 1928 and entered the service May 10, 1941.

Captain W. Garrett Hume III

For heroic action in which he voluntarily endangered his own life to save others, the Soldier's Medal was recently awarded to Capt. W. Garrett Hume III, formerly of Wilmington, Del. According to the citation accompanying the award Captain Hume, a medical officer with the 15th Air Force in Italy, went to the scene immediately when an ammunition ship exploded in the port of Bari, Italy, and began removing the injured and rendering first aid at the scene of the tremendous blast. "With full knowledge of the possibility that another explosion equally destructive might occur at any time, he courageously entered the most dangerous area and carried injured military and civilian personnel from wrecked buildings, in one instance entering a burning ship to effect the rescue of several persons." Dr. Hume graduated from Temple University School of Medicine, Philadelphia, in 1941 and entered the service in August 1942.

Lieutenant Colonel Harrison S. Collisi

The Bronze Star was recently awarded to Lieut. Col. Harrison S. Collisi, formerly of Grand Rapids, Mich., "for meritorious service in connection with military operations, as commanding officer, 197th General Hospital, European Theater of Operations, from Dec. 29, 1944 to May 8, 1945." Continued the cita-

tion accompanying the award, "Lieutenant Colonel Collisi displayed exceptional ability in organizing and operating the unit hospital at Saint Quentin, France, for the receiving and treatment of troops wounded in combat on the continent. He was responsible for efficiently solving the numerous technical problems which arose in setting up and the operation of this hospital during this period. By his superior organizational ability, untiring efforts and keen foresight in planning, Lieutenant Colonel Collisi established a general hospital which displayed a high degree of perfection and reflects high credit on himself and the armed forces of the United States." Dr. Collisi graduated from the University of Michigan Medical School, Ann Arbor, in 1912 and entered the service May 18, 1942.

Major Duncan A. Cameron

The Bronze Star was recently awarded to Major Duncan A. Cameron, formerly of Brighton, Mich., "for meritorious service in connection with military operations against the enemy as general surgeon, 3d Auxiliary Surgical Group, from June 6, 1944 to Nov. 15, 1944 in France, Belgium and Germany. Since landing on the European continent on D day, Major Cameron displayed marked professional skill and great personal vigor in the performance of innumerable surgical operations. He often continued his medical duties for extremely long periods of time in order to perform immediate life-saving operations on battle casualties. By his sound medical knowledge and unswerving devotion to duty Major Cameron reflected credit on himself and the military service." Dr. Cameron graduated from Wayne University College of Medicine, Detroit, in 1933 and entered the service Oct. 2, 1942.

Lieutenant Colonel Robert W. Lloyd

The Bronze Star was recently awarded to Licut. Col. Robert W. Lloyd, formerly of Portland, Ore., for services during the hard fighting with the 10th Mountain Unit in the Apennines of Italy last winter. "His superlative performance during the period was characterized by a conscientious devotion to duty, with meticulous attention to the sick and wounded. . . . He maintained a high state of discipline and morale among the men under his command, many of whom were frequently required to work long hours without rest under distressing conditions. He played a major role in providing efficient medical support to the combat troops within the division, bringing him much praise and commendation." Dr. Lloyd graduated from the University of Oregon Medical School, Portland, in 1934 and entered the service Dec. 1, 1938.

Captain Blaine Carey

The Bronze Star was recently awarded to Capt. Blaine Carey, formerly of Nebraska City, Neb., for "meritorious service with the 26th Infantry Division." Dr. Carey graduated from the University of Nebraska College of Medicine, Omaha, in 1943 and entered the service Jan. 20, 1944.

Captain Herbert F. Staubitz

Capt. Herbert F. Staubitz, formerly of Omaha, was recently awarded the Bronze Star for performance of duties as receiving officer of the 128th Evacuation Hospital in Germany. Dr. Staubitz graduated from the University of Nebraska College of Medicine, Omaha, in 1932 and entered the service Sept. 7, 1943.

MISCELLANEOUS

AMERICAN RED CROSS HEALTH SERVICES ADVISORY BOARD

Basil O'Connor, national Red Cross chairman, recently announced the appointment of an Advisory Board on Health Services to coordinate activities of the American Red Cross in the health field. Dr. Lewis H. Weed, Baltimore, was named board chairman; he is also chairman of the medical sciences division of the National Research Council and director of Johns Hopkins University School of Medicine, Baltimore. The committee consists of 109 men and women from twenty-five states and the District of Columbia and includes not only physicians but nurses, dentists, health educators, medical and psychiatric social workers, hospital administrators and others. The three members of the board who will serve as vice chairmen are Dr. Roger I. Lee, Boston; Dr. John D. Lyttle, Los Angeles, and Dr. John Romano, Cincinnati. The executive committee includes as vice chairmen George Baehr, New York, and Kenneth I. Maxcy, Baltimore, and as secretary Henry R. Viets, Boston. The members are Amos Christie, Nashville; Miss Ruth Emerson, Chicago; Everts A. Graham, St. Louis; Morris Fishbein, Chicago; Ira Hiscock, New Haven, Conn.; Charles C. King, New York; Basil MacLean, Rochester, N. Y.; Walter Scherer, Houston, Texas; Miss Miriam W. Sheahan, Albany, N. Y.; Ernest L. Stebbins, New York; Edward A. Strecker, Philadelphia, and Abel Wolman, Baltimore. The first meeting of the board's executive committee will be held in Washington, December 15. The entire board will meet at least once a year. Major Gen. Norman T. Kirk, surgeon general of the Army, Vice Admiral Ross T. McIntire, surgeon general of the Navy, and Thomas Parran, surgeon general, U. S. Public Health Service, were named ex officio members of the general board.

FELLOWSHIPS OFFERED IN NEUROPSYCHIATRY

The Austin Riggs Foundation, Stockbridge, Mass., recently announced that fellowships for three years' training in neuropsychiatry are now open. Army personnel who wish to go into the field of neuropsychiatry may apply to Dr. Charles H. Kimberly, Medical Director, Austin Riggs Foundation, Stockbridge, Mass.

MEDICAL AND SURGICAL RELIEF COMMITTEE OF AMERICA, INC.

The Medical and Surgical Relief Committee of America, Inc. (420 Lexington Avenue, New York 17), recently sent a stationary x-ray machine and accessories, donated by Brig. Gen. Theodore Roosevelt, to France for the use of returned soldiers. The x-ray bears a bronze plaque including the names of the French troops with whom General Roosevelt served in both World War I and II, together with dates of his service and a list of his decorations.

NURSES NATIONAL MEMORIAL TO BE ERECTED IN WASHINGTON

A \$2,000,000 Nurses National Memorial is to be erected in Washington, D. C., in tribute to the devotion and sacrifice of the war nurses and medical women of World War II. The Memorial Committee, with headquarters at 825 Woodward Building, Washington, D. C., announced that the proposal to honor the heroic nurses with a living, practical memorial has struck a responsive note from people in all walks of life. Mrs. Norman T. Kirk, wife of Major General Kirk, Surgeon General of the United States Army, who conceived the project, and who herself served as an army nurse in World War I, said:

"When the proposal to build and endow a Nurses National Memorial in Washington to help the war nurses throughout the years is fully understood, we hope the funds will be forthcoming.

"The memorial will be a center for war nurses. It will be their 'home' when they are in the capital city. Those who need a rest period from their nerve and body racking work in war and in peace will find it here.

"Those who seek educational work and who come here for special courses will make the memorial their center of activities.

"Such a building is urgently needed. It will provide these facilities for the medical women at very low cost of the food served. This is a purely volunteer effort but we will find the way to make it a reality."

Arrangements are being made by the executive committee for a luncheon early in December, when detailed plans for speeding the campaign will be formulated.

ORGANIZATION SECTION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CHICAGO, DECEMBER 3-5, 1945

HOUSE OF DELEGATES

First Meeting—Monday Morning, December 3

The House of Delegates convened in the Red Lacquer Room of the Palmer House and was called to order at 10:15 a. m. by the Speaker, Dr. H. H. Shoulders.

Preliminary Report of the Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, stated that 160 delegates were registered at this time. Dr. Mundt requested that officers and members of official bodies of constituent state and territorial medical associations be registered in attendance. The Speaker stated that no official registration was required of them since they could listen in and have their say at any reference committee meeting. The Secretary announced that he would try to make arrangements for such registration.

Roll Call

The Secretary called the roll and announced that a quorum was present.

Distinguished Service Award

Dr. James R. Bloss, Chairman of the Board of Trustees, presented a report of the Board, as follows:

The Committee on Distinguished Service Award of the American Medical Association submitted five names to the Board of Trustees.

In accordance with chapter VI, section 5, of the By-Laws, the Board has selected by ballot the following names for presentation to the House of Delegates in alphabetical order: Dr. Isaac A. Abt, Chicago; Dr. A. J. Carlson, Chicago; Dr. George R. Minot, Boston.

The Speaker appointed as tellers Drs. Thomas A. Burcham, Chairman, Iowa; Dr. Frank R. Mount, Oregon; Dr. Lee O. Frech, Illinois; Dr. Walter P. Anderton, New York, and Dr. Alex M. Burgess, Rhode Island.

The tellers spread the ballot, and the Secretary announced that one hundred and fifty-six votes had been cast, of which Dr. Abt received forty-nine, Dr. Carlson forty-five and Dr. Minot sixty-two.

The Speaker announced that, since no one nominee had received the majority of the votes cast, the name of the one receiving the lowest number of votes would be dropped and ballots prepared for Drs. Abt and Minot.

The Secretary stated that one hundred and fifty-two votes had been cast, of which Dr. Abt received fifty-six and Dr. Minot ninety-six.

The Speaker declared Dr. George R. Minot, who had received the majority of the votes cast, to be elected by the House of Delegates to receive the Distinguished Service Award of the American Medical Association.

Adoption of Proceedings of Chicago Session in 1944

On motion of Dr. Thomas S. Cullen, Maryland, duly seconded and carried, the proceedings of the Chicago Session of the House of Delegates held in 1944 were adopted as printed.

Address of Speaker, Dr. H. H. Shoulders

The Vice Speaker, Dr. R. W. Fouts, Nebraska, presided while the Speaker read his address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker, Members of the House of Delegates and Guests:

Without a doubt the physicians of this country now have the confidence and respect of the general public to a higher degree than has been the case for a long time, if not for all time. This is desirable from the point of view of the public interest as well as from that of the medical profession. Organized medicine still has its critics, of course, and no doubt always will have them as long as it refuses to bend its knees to those who would rule it from without. These critics, however, are less numerous and certainly less potent than they were not so long ago. I mention this fact not merely to point with pride, but rather to consider briefly the influences and factors that have played an important part in achieving for medicine this public esteem.

It would be difficult, if not impossible, to identify all the factors that have played some part in producing this esteem, and still more difficult to appraise accurately the importance of each. Here are a few of the factors that I believe are of the greatest importance:

1. Better public relations. Excellent work in the field of public relations has been done by individual members and by official agencies of the Association, with beneficial results.

2. The education of the public. Programs designed to acquaint the public with the meaning and value of good medical care and as to what constitutes good medical care have been fruitful of good results.

3. Progress in the science and art of medicine. Great progress has been made in the science of medicine and in the art of applying it to the needs of humanity. We doctors are now in a position to render services we could not render a few years ago. Our services are more effective and beneficial than they have ever been previously.

4. The factor of paramount importance, one which in all justice and propriety may be called the soul of medicine.

I would not attempt a specific definition of the word "soul". No one has ever supplied a precise and generally accepted definition; yet we all recognize its existence in the human being and the possibility of its existence in a human organization. No one has been able to determine the place of the soul in the mechanism of the body. I certainly would not attempt to designate its location or even its possible location in this organization. In fact its attributes are so apparent throughout the organization that it would be folly to attempt to assign to it a specific location. The presence of a soul in an individual or organization is recognized by its humane attributes, such as charity, courage, lofty ideals and loyalty to them, and a genuine interest in the welfare of fellow human beings. The soul of medicine is not of recent conception. It appeared when medicine began as a profession. The ideals and principles to which young physicians dedicated themselves in the time of Hippocrates and the original code of ethics could have had no other origin.

The ideals and purposes set forth in the constitution of this Association furnish adequate proof that the soul of medicine has lived through the centuries. There is ample proof that it has survived to this day. In the last fifteen years our nation has passed through many crises, including the worst depression within the memory of men now living and the most gigantic war in all history. There have been many times that have "tried men's souls." The soul of medicine has been tried also and not found wanting. Medicine has never been willing to sell its soul for a mess of pottage.

To recite but a few of the acts of heroism, sacrifice and charity by members of the medical profession in this period

would consume many hours; I shall not mention resistance to temptations to which many another have succumbed. The lamented Ernie Pyle through his touching record of this war gave the public a fleeting glimpse of the devotion and sacrifice of doctors in the military service and what that devotion and sacrifice meant to soldiers on the battle fronts. We know something of those who rendered their services in the less glamorous atmosphere of the home front. They too served beyond the call of duty and many beyond the limits of endurance. In times of depression more than any other time the soul of medicine has opportunities and occasions to find expression. In many different ways it speaks to the people who grasp something of its significance in the delivery of the services we call medical care. In literature, both sacred and profane, we read that a soul may be lost or sold—that a soul may vary in its dimensions. To the preservation of the soul of medicine and the great dimensions that it has achieved we dedicate ourselves ever anew.

As I view the future I see that the soul of medicine will still be tried. Possibly the attention of physicians for the moment may become so sharply focused on some economic issue or proposal of political expediency that the soul may be lost to sight. This would be a tragedy of the first magnitude.

Sociologists, economists and political scientists have made strenuous attempts to bring medicine under the domination of one or all of these groups through the mechanism of legislative enactment. Their efforts have failed. Their lack of success, in my opinion, is due not so much to the fact that their proposals were untried and impractical as to their failure to recognize and take into account the soul of medicine.

The responsibility for the continued preservation of the best in American medicine still rests largely in the hands of this House of Delegates. Let us again, now as in the past, concern ourselves, with advancing the science of medicine, with maintaining the standards of medical education and with delivering a higher quality of medical service, ever mindful that science without a soul may be cruel and inhumane, whereas science possessed of a soul is the very highest achievement—the apotheosis of humanity.

In Memoriam

The Speaker resumed the chair and requested the Vice Speaker to read the list of names of members of the House of Delegates and/or officers of the American Medical Association notice of whose death had been received since the 1944 Chicago session.

The Vice Speaker read the list of names as follows:

(The dates following the names indicate years of service in the House or as officers of the Association)

Benjamin F. Bailey, Nebraska, 1930-1937
 Samuel C. Baldwin, Utah, 1904-1905; 1908.
 Edgar G. Ballenger, Georgia, 1912.
 Philip F. Barbour, Kentucky, 1936
 Eben H. Bennett, Maine, 1912-1913.
 Hugh Cabot, Massachusetts, 1911-1915.
 Byron M. Caples, Wisconsin, 1905-1908, 1911.
 Walt P. Conaway, New Jersey, 1931-1938 First Vice President, 1913-1914.
 James H. Corwin, Pennsylvania, 1934, 1942-1943.
 James M. Dinnen, Indiana, 1913-1914.
 Edwin D. Ebright, Kansas, 1926.
 David L. Edsall, Boston, First Vice President, 1919-1920
 John W. Flinn, Arizona, 1920, 1922.
 George Edgar Hollansbee, Ohio, 1919-1922, 1924-1930. Member Judicial Council, 1925-1945; Chairman, 1928-1945
 Oscar M. Gilbert, Colorado, 1928-1929
 William A. Groat, New York, 1939-1940, 1942.
 John T. Herron, Tennessee, 1904-1905.
 Michael Hoke, Georgia, 1908
 Lawrence C. Ingram, Florida, 1932.
 Peter Irving, New York, 1938-1940.
 John L. Jelks, Tennessee, 1911.
 John E. Jennings, New York, 1931.
 Elmer L. Kenyon, Chicago, Section on Laryngology, Otology and Rhinology, 1917.
 J. Richard Kevin, New York, 1920-1925; 1927-1931, 1935-1936
 William A. Krieger, New York, 1942.

John Leeming, Chicago, Second Vice President, 1916-1917.
 Michael M. Lucid, New York, 1915.
 Charles MacLachlan, North Dakota, 1916; 1918; 1929-1930.
 Van Newhall Marsh, Ohio, 1938.
 Joseph McFarland, Philadelphia, Section on Pathology and Physiology, 1905-1906.
 Frederick W. Meyer, Philippines, 1937-1938.
 Douglas C. Moriarty, New York, 1907-1909.
 William A. Mulherin, Georgia, 1942-1944.
 John Q. Myers, North Carolina, 1920-1921; 1937-1939.
 Edwin M. Neher, Utah, 1922; 1924; 1926-1928.
 J. Mark O'Farrell, Texas, 1920.
 Richard F. O'Neil, Boston, Section on Genito-Urinary Diseases, 1912.
 Edward M. Pallette Sr., California, 1933; 1935-1936; 1938-1942. Member Board of Trustees, 1942-1944.
 Edward C. Podvin, New York, 1941-1943.
 Leonard G. Redding, Pennsylvania, 1940-1943.
 Charles M. Rosser, Texas, 1929; 1931.
 Charles J. Smith, Oregon, 1905; 1910-1911.
 Alexander H. Stewart, Pennsylvania, 1942-1944.
 Samuel W. S. Toms, New York, 1911; 1913-1914.
 George E. Tooley, Kansas, 1908.
 Philemon E. Truesdale, Massachusetts, 1929.
 James B. Vaughn, South Dakota, 1922-1923.
 John A. Walker, Oklahoma, 1910.
 James T. Wayson, Hawaii, 1905
 William K. West, Michigan, 1905.
 Sidney J. Wolfermann, Arkansas, 1944.
 David I. Wolfstein, Cincinnati, Section on Nervous and Mental Diseases, 1905.
 Hugh Young, Maryland, 1910; 1914; 1926.

On request of the Speaker, the House stood in silent tribute to the memory of those of its members and of officers of the Association who had died since the Chicago session of the House in 1944.

Reference Committees

The Vice Speaker resumed the chair and requested the Speaker to proceed with the appointment of his reference committees.

The Speaker read the list of appointments and requested permission to appoint four additional reference committees, as follows: Reference Committee on Executive Session, Reference Committee on Postwar Planning, Reference Committee on Medical Care of Veterans and Reference Committee on Industrial Health.

It was moved by Dr. E. S. Hamilton, Illinois, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, that the House approve the appointment of the four additional reference committees requested by the Speaker.

The personnel of all reference committees as appointed by the Speaker was as follows:

SECTIONS AND SECTION WORK

William Weston, Chairman, Section on Pediatrics
 James Beche, Delaware Warren L. Allee, Missouri
 Hugh P. Smith, South Carolina Olin H. Weaver, Georgia

RULES AND ORDER OF BUSINESS

Francis F. Borzell, Chairman, Pennsylvania
 E. G. Wood, Tennessee Samuel J. McClendon, California
 T. S. Crockett, Indiana Lucius F. Donohoe, New Jersey

MEDICAL EDUCATION

Fred M. Smith, Chairman, Section on Practice of Medicine
 Thomas S. Cullen, Maryland Leon J. Menville, Louisiana
 George W. Kosmak, New York A. W. Adson, Minnesota

LEGISLATION AND PUBLIC RELATIONS

Edwin S. Hamilton, Chairman, Illinois
 Lloyd Noland, Alabama Edward L. Bortz, Pennsylvania
 John J. Masterson, New York Raymond L. Zech, Washington

HYGIENE AND PUBLIC HEALTH

Felix J. Underwood, Chairman, Mississippi
 Warren F. Draper, U. S. Public Health Service Walter E. Vest, West Virginia
 D. F. Cameron, Indiana Creighton Barker, Connecticut

AMENDMENTS TO THE CONSTITUTION AND BY-LAWS

Carl R. Steinle, Chairman, Ohio
 Karl S. J. Hohlen, Nebraska George P. Johnston, Wyoming
 Thomas A. Foster, Maine Ross S. McElwee, North Carolina

REPORTS OF OFFICERS

Floyd S. Winslow, Chairman, New York
 Thomas K. Lewis, New Jersey Harold W. Smith, U. S. Navy
 Deering G. Smith, New Hampshire George H. Curfman, Colorado

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Thomas A. McGoldrick, Chairman, New York
William A. Coventry, Minnesota Dwight O'Hara, Massachusetts
J. B. Lukins, Kentucky Thomas F. Thornton, Iowa

CREDENTIALS

G. Henry Mundt, Chairman, Illinois
H. B. Everett, Tennessee Howard R. Dudgeon, Texas
Charles R. Rountree, Oklahoma Edward N. Roberts, Idaho

MISCELLANEOUS BUSINESS

James R. Reuling Jr., Chairman, New York
Stephen E. Gavin, Wisconsin Leonard W. Larson, Section on
Henry A. Luce, Michigan Pathology and Physiology
William Bates, Pennsylvania

EXECUTIVE SESSION

Walter F. Donaldson, Chairman, Pennsylvania
Edward Jelks, Florida Thomas P. Murdock, Connecticut
James R. McVay, Missouri Clark Bailey, Kentucky
William R. Brooksher, Arkansas Allen H. Bunce, Georgia

POSTWAR PLANNING

Charles H. Phifer, Chairman, Illinois
J. Stanley Kenney, New York Harry V. Paryzek, Ohio
Leo G. Christian, Michigan B. R. Kirklin, Section on Radiology
F. J. L. Blasingame, Texas J. Morrison Hutcheson, Virginia

MEDICAL CARE OF VETERANS

Walter G. Phippen, Chairman, Massachusetts
Forrest L. Loveland, Kansas Leland S. McKittrick, Massachusetts
James C. Sargent, Wisconsin Parke G. Smith, Ohio
Henry R. Viets, Section on Nervous and Mental Diseases Britton E. Pickett Sr., Texas

INDUSTRIAL HEALTH

William L. Estes Jr., Chairman, Pennsylvania
Oliver W. H. Mitchell, New York Dwight H. Murray, California
Stanley H. Osborn, Section on Preventive and Industrial Medicine James Q. Graves, Louisiana
and Public Health James P. Kerby, Utah
Barney J. Hein, Ohio

TELLERS

Thomas A. Burcham, Chairman, Iowa
Frank R. Mount, Oregon Walter P. Anderson, New York
Lee O. Frech, Illinois Alex M. Burgess, Rhode Island

SERGEANTS-AT-ARMS

Frank E. Reeder, Chief, Michigan
A. P. Nachtwey, Assistant, J. D. Hamer, Assistant,
North Dakota Arizona

Address of the President, Dr. Herman L. Kretschmer

The Speaker resumed the chair and presented the President, Dr. Herman L. Kretschmer, who delivered the following address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker and Members of the House of Delegates:

The realization that my term of office is about to come to a close and that this is my last opportunity to address the House of Delegates naturally creates a feeling of sadness. However, the honor and privilege to serve you during the past two years have given me joy and satisfaction and more than compensates.

May I take this opportunity to praise those members of our profession who have been ever willing to do the "leg work" for American medicine and who at a great sacrifice of time and comfort do the many chores requested of them. These physicians many times perform an indispensable function. By the nature of their tasks, their activities are little known to the profession at large; yet they render outstanding service to you and to me and their praises are rarely sung.

I should like also to commend those who serve on special committees and those who tour the nation speaking to medical societies and lay audiences, often at a great sacrifice of time from their practices.

I view with alarm the gross indifference of so many of our members, eminent and successful practitioners, specialists and those who hold responsible teaching and other positions who do not manifest any interest in the work of their county or state society, much less in the activities of the American Medical Association. It seems to me that it is high time for them to take an active interest in the affairs of American medicine. They should ask themselves the question What can I

do for American medicine? instead of What can American medicine do for me? I would urge the younger men especially to take an active interest in their county and state societies and so gradually work into the affairs of the American Medical Association. It is they who must guide the destinies of American medicine in the years to come.

REGIMENTATION OF THE PRACTICE OF MEDICINE

The tendency in this country to enact legislation toward regimentation of the patient and the physician is of the greatest importance to every man, woman and child. This tendency is equally important to the medical profession, to business, to industry and to labor. It should be perfectly clear to every one that regimentation always leads to totalitarianism, and it always begins under one guise or another with medical practice. It is insidious in onset and progressive in its course, and the fatal result is regimentation of labor and business as well as of the practice of medicine.

Those most vociferous in favor of regimented medicine formerly pointed with pride to Germany as a country which was the furthest along with social legislation. Since it has led to totalitarianism and the complete collapse of Germany, they no longer hold her up as an example of regimentation of medical practice.

One might rightly ask Since when have the American people suddenly become so sick and so incapable of taking care of themselves? Since when have our people become so dependent as to need security from the cradle to the grave? I don't think they have. I believe the pioneer spirit of our people is not gone. I feel that the average American wants to establish his own security and select his own physician. If you don't believe that, talk to the returning G. I's.

The American Medical Association, since its founding nearly one hundred years ago, has always been interested in raising the health standards of our people. We as physicians know better than any one else that a healthy nation is a happy and a strong nation. With the objective of improving the health standards of the people we have no disagreement with any one. We, however, disagree wholeheartedly with the technic at present advocated to attain this end. When will the legislator, the "do gooder" and others learn that disease cannot be cured by the passage of laws?

It is interesting to note that the strongest pressure to upset the present-day system of practice comes from areas with the largest number of doctors, hospitals and medical schools.

How then can the problem be met? Not by upsetting the system that has made the people of this country the healthiest in the world. The solution is not in the passing of laws and the institution of a system that will lower the quality of care; it is by doing exactly what is done with the sick patient—namely, to make a careful examination of the patient to locate and determine the cause of his illness and to institute the correct treatment. Exactly the same technic can be applied to this problem. When an epidemic arises in a town we don't burn down the town. When a factory falls off in production and efficiency, the causes are determined and corrected. The manufacturer does not tear down the factory and build a new one.

And so the solution of this problem is to determine the site and causes and to institute corrective measures, going about it in an "honest," efficient way. The American Medical Association through its Council on Medical Service and Public Relations has taken a long step forward. The various state medical societies likewise are on the move. I believe that this House of Delegates should make our position very clear. I believe that the House of Delegates, speaking for more than 125,000 physicians of this country, should make it perfectly clear that the physicians are the ones who render medical care, that the physicians of this country will not be regimented and that when chaos in medical care arises the people will have had ample warning of what lies ahead. Let our position be clearly defined.

I believe that your Council on Medical Service and Public Relations, in cooperation with other groups, can find the answers to these problems if they are given the opportunity to do so.

CHANGES IN THE PROGRAMS OF THE COUNTY
MEDICAL SOCIETY

The county medical society must always remain the basic unit in our medical organization. For many years there has been little change in the program and activities of county medical societies. With the changing trends in medical practice, this is a good time to take inventory and to make whatever changes are necessary in the work of the county medical society to make its work more efficient:

1. The scientific program might with great advantage be enlarged or expanded. Instead of having each county medical society conduct a scientific program once a month, it might be better to have scientific meetings of six or eight or ten adjoining counties. Then the program could be arranged as an all day and evening scientific program. This would ensure a large gathering, better speakers and a better coordinated program. Such a program could be planned to cover many topics, and the subjects could be presented from a postgraduate point of view.

2. The regular organizational meetings of the county medical society could then be devoted wholly to such problems as are ethics, economics and organization.

3. With this rearrangement of the workings of the county medical society, meetings should be devoted to the interests of the public at which timely educational topics could be presented to a lay audience. Moreover, meetings could be held in association with the social service, relief, political, public health and similar groups. Here the position of the medical profession on many of the present-day controversial problems could be presented to the laity on an educational basis.

THE X-RAY FILM QUESTION

During the course of the year I see many patients who have had elsewhere recent x-ray films, including intravenous pyelograms. Instead of repeating these studies, I suggest that the patient bring in his films, so that, if they are satisfactory, expensive repetition may be avoided. When the patient tries to obtain his films, some physicians, hospitals and roentgenologists refuse to release them. The result is that the patient is irked, an expensive procedure must be repeated and enemies are made for the medical profession.

These attitudes are leading to a great deal of dissatisfaction on the part of both patients and physicians and indirectly encourage those who would regiment medical care.

There must be some solution to this problem. The House of Delegates should clarify the issue. I am sure you will agree with me that this situation needs correction.

THE HORMONE SITUATION

Among the problems demanding prompt consideration by official bodies in American medicine is the present confused hormone situation. I have only the greatest admiration for the workers in this field—the biochemist, the physiologist, the pharmacologist and some of the clinicians, all of whom have made wonderful contributions to our knowledge and understanding of the entire subject of endocrinology.

Associated with this great achievement many situations have arisen that need correction because they are leading to gross abuses. Medicine is, as we all know, subject to fads. Unfortunately there is now a tendency to consider every obscure complaint as being of endocrine origin, if it is not psychosomatic or neuropsychiatric or even due to a deficiency of vitamins. Many physicians and laymen seem to believe that anything that is immediately unexplainable must be of endocrine origin and requires hormone therapy.

The medical profession and the public hear much of the "male climacterium," a term which in my opinion serves too frequently as a catchall for anything and everything that happens to a middle aged man that is in the least bit obscure. When one reviews the long list of symptoms ascribed to this condition, one finds nearly all the symptoms listed in the textbooks except housemaid's knee, and I don't know why it is not included.

I have seen patients with obscure lesions of the prostate given long courses of hormone injections. I have seen patients

with mental problems, with family incompatibility, with fear complexes and with impotence, both psychic and prostatic in origin, for whom diagnoses of male climacterium were made and who were advised to take long courses of hormone therapy. Castrated patients without any subjective symptoms have been advised to have hormones so as to make them fertile. The injection of hormones for undescended testis has also been subjected to misuse. Such use has been tragic in many instances.

Why is it that we must see so frequently the advancement of new ideas and techniques subjected to abuse? When will we learn to differentiate between experimental and established treatment, between advertising puffery and established facts? When will we learn to look on the patient as an individual and not as a catchall for shotgun treatment? Hormones have great possibilities, but let us not help to turn their use into another vitamin-like fiasco.

People have become hormone conscious and request hormone injections for any and all complaints. Not only does the medical profession have a serious obligation to correct these abuses in their practices, but the editors of health columns, scientific writers in lay periodicals and the purveyors of these products have an obligation in the prevention of the dissemination of wrong information. The "elixir of life" has not yet been found. If those who educate do not meet their responsibility, they must shoulder the blame when harm is done.

ANIMAL EXPERIMENTATION

One of the subjects which I believe should receive your earnest consideration is the need to educate our people on the subject of animal experimentation. You are just as familiar as I am with the recurring attacks against animal experimentation. The prevention of these recurring attacks must be a continuing program of education. I am sure that, once the public has realized the value and the far-reaching results of animal experimentation, we will gain their confidence and support. Such an educational program must be far-reaching and not sporadic. It should be projected for many years, not just when the need arises. The public should be told that the antivivisectionists throttle research by playing on the emotions of the people. As a result of the sentimental activities of the antivivisectionists, the public has not been informed as to the true facts of animal experimentation, particularly that both man and animals are the beneficiaries.

I believe that the county medical society should take the lead and cooperate with the state medical society. Unless a definite, long range program is carried out, medical science will be stifled to the detriment of the patient. The use of the radio, newspapers and motion pictures favorable to animal experimentation should be extended. Perhaps the time has come when medicine should take the offensive and obtain enabling legislation rather than to remain ever on the defensive.

THE MARIHUANA PROBLEM

Acutely before the nation today is the problem of marihuana. As guardians of the public health and as purveyors of information to those seeking it, the American Medical Association should take the leadership in securing the scientific studies necessary to positive conclusions.

There is a good deal of confusion and difference of opinion on this subject. Some glibly dismiss the harmful effects from marihuana. Others are firm in their convictions that the use of marihuana is dangerous. We as physicians who are interested in safeguarding the health of the people of this country should be deeply concerned. Law enforcement officers, legislators, judges of the courts, lawyers and social workers are equally interested. They naturally look to the medical profession for guidance. The reports on the rapidly increasing spread of the use of marihuana are conflicting. What is the layman to do in seeking an answer to this problem when diametrically opposing statements are made? Where should law enforcement officials turn for proper guidance? I believe that this problem with its far-reaching implications is deserving of your earnest consideration. To whom if not to the American Medical Association shall those interested in this problem turn for authoritative information? I myself believe that the marihuana habit is not harmless. Evidence has been

presented to show that the use of marihuana has resulted in the sudden unbalance of the mind and with it the commission of a crime. Let us take an active interest in this subject and establish data through the American Medical Association that will be authoritative and available to all interested.

THE DEFERMENT OF MEDICAL STUDENTS

The Council on Medical Education and Hospitals and the House of Delegates must take great pride in the results of the establishment of the certifying boards. By this accomplishment there were made available for the armed forces lists of certified specialists, so that our military officials were able to render the best possible medical and surgical care to the men and women of our armed forces. The Board of Trustees rendered an outstanding service when it undertook to classify all physicians of this country and so was ready to supply the armed forces with available medical personnel. Contrast these achievements with the haphazard procedures followed in the handling of premedical and medical students. These procedures have led to confusion and chaos, and as a result there will be a great shortage of physicians in the postwar era.

I would urge this House of Delegates to take positive action and to demand that a similar situation be not permitted to arise again. We will find in this action the complete support of engineers, chemists, physicists, mathematicians and, in fact, the members of every scientific profession, since all branches of science have suffered and are still suffering from this amazing stupidity of our governmental leaders.

THE PROBLEM OF CHRONIC ILLNESS

The care of the patient with chronic illness is not a new problem, as many would have us believe. Nevertheless the ever increasing number of persons who reach the time of life when many of these diseases begin to manifest themselves puts new emphasis on this situation. The great advances of medicine, which have increased the span of life from 42.5 years in 1900 to 64.5 in 1942, have multiplied tremendously the diseases of advanced years seen by physicians. As the span of life will continue to increase, so will the number of patients who suffer from the degenerative diseases increase. The medical profession has given much study to these problems and as a result geriatrics, a new branch of medicine, was born.

Chronic illness carries with it serious social and economic, as well as medical, problems.

We as physicians are vitally interested in this problem. I believe that this House of Delegates should give serious study to the demands created in the field of geriatrics. What constitutes chronic illness? What is the difference between illness that is chronic and incapacitating and that which, while chronic, does not necessarily prevent the patient from earning a livelihood? What should be the obligation of the family, of industry and of the state in this problem?

THE RETURNING MEDICAL OFFICERS

Although the Association has given serious study to the problems of the returning medical officers, some problems have arisen that it could not foresee. The study and expansion of postgraduate facilities and the establishment of the Bureau of Information have been very helpful to the returning officers. There are several problems that are deserving of your earnest consideration. I refer to the difficulty on the part of these men to obtain suitable office space and suitable hospital appointments. These men have served in the armed forces at a great sacrifice. They have performed a great patriotic service and should be given all the help possible. The question of rearranging one's office hours should be simple. The difficulties often placed in the way of these men in obtaining hospital appointments is something that deserves your earnest consideration. In many hospitals the privilege of being a member of the staff or the privilege of bringing patients to the hospital is contingent on membership in the county medical society. In some places returning medical officers have been placed on probation for one or two years. This practically closes to them the doors of the hospitals. The procedure is unwarranted, unfair and un-American.

For a quarter of a century I have been officially connected with the American Medical Association through positions held in the county, state and national societies. In this period problems that seemed wellnigh insuperable have arisen and have been considered by the House of Delegates. Many of the situations which confront us today were being viewed with alarm and despair in 1918 and 1919, when my first official relationships were made. As I view the years that have passed, we have not given an inch of ground to the opposition but have gone steadily forward, advancing medical science, extending medical service and gaining leadership in all the world for American medicine. This is no time for retreat. Let us go forward in the firm belief that we are waging a battle for the right, for the ideals on which medicine must stand or fall, for the advancement of the science of medicine and for the elimination of unnecessary suffering and disease.

Address of the President-Elect, Dr. Roger I. Lee

The Speaker presented the President-Elect, Dr. Roger I. Lee, Boston, who delivered the following address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker and Members of the House of Delegates:

Your President-Elect would indeed be an ingrate if he did not express formally on this occasion his deep and abiding acknowledgment of the very great honor that you have conferred on him. This House of Delegates is the duly accredited body representing the greatest and most important as well as the largest medical association in the world. I believe that the medical profession is the noblest of all the professions. I know, as all men know, that American medicine is at this day and date incomparably superior to medicine elsewhere. To be selected as President-Elect of the American Medical Association is at once flattering and brings a glow to one's pride, but it is also sobering and awesome. Some better man has said that great institutions have the potentiality of permanent life. They are rarely killed, they rarely commit suicide, but if they die they usually die of dry rot. And dry rot does not occur in an organism or organization that is healthy, growing, active and purposeful. In my long and intimate connection with this Association, vigorous growth and tremendous expansion have been its outstanding characteristics.

It is not my intent to pursue further this vein of thought. It is rather to beg your indulgence and embark on a discussion which may seem presumptuous on my part. I have been interested in and concerned with the improvements in and for the medical profession all my medical life. I early came to the conviction that, by and large, high standards of professional activity, like high standards of personal conduct, actually come from within. Hence began my interest in doctors as a group. It is a commonplace too often forgotten that professionals and experts are the only ones qualified to set up professional and expert standards. Obviously at those points where the professions touch the public or the laity, such public contacts and relations are not exclusively the concern of the professionals, but the technical standards within the profession belong to the profession.

It may be of little interest to you, but I first sat in this House of Delegates in 1910. It was, however, a number of years later that I became, as it were, a regular member of the House of Delegates. For the last ten years, by your election, I have served on the Board of Trustees. Over these years I have observed many things, and some of these reflections I want to give to you.

I have been through the well known phases so well described by a late member of Congress. At first he wondered why he was there, in such an august body, then he wondered why in — these other fellows were there and finally came to the conclusion that it was a good thing that all men (including Congressmen) were not made in the same mold and that there were good reasons for all of them being there, even if in a very few instances the reasons seemed somewhat obscure.

There can be no doubt, I think, that the House of Delegates of the American Medical Association is a truly democratic body and functions in a truly democratic fashion. For myself I believe that the Delegates are elected in the spirit of democracy. Even if it were not so, the remedy lies elsewhere.

Perhaps the most common adverse comment on the House of Delegates and indeed on the American Medical Association relates to what is called insufficient infusion of younger men, of young blood into the House of Delegates. As I have said, the remedy does not lie in this House of Delegates but elsewhere, namely in the constituent associations. This may be an appropriate time to discuss this problem, because with many of the younger Fellows not yet released from the armed forces considerable changes can hardly be put into operation at this moment. But certainly with the return of those Fellows who were fortunate enough to be allowed to put on the uniform, prompt recognition of these younger men should be made by placing them on the councils and committees of the Association.

As to the House of Delegates, the question of rapid change in the personnel may well be debatable. There are advantages of continuity of service beyond doubt, but there are advantages too of steady, even if not rapid, changes in the personnel of the House. Personally, I am a believer in the general policy of steady change. I regard it as a particularly wise provision that the Trustees of the Association are permitted by the Constitution to serve only two consecutive terms. Since human nature is as it is, too often the replacement of an older man by a younger man is too often regarded as a deliberate insult even when perhaps only membership on a not very important committee is involved. But it is wise and desirable that as many Fellows of the Association as feasible be encouraged to participate in the affairs of the Association. Even as I look over this distinguished House of Delegates, I have to blush on account of my own antiquity of service. And while I may have some company and I am sure it is very select, it is hardly a corporal's guard.

It is a pet phrase of many that a democracy is of necessity inept, cumbersome and slow. That certainly has not been my observation in the case of the House of Delegates of the American Medical Association. It turns out a vast amount of business in an astonishingly short time. To be sure, like all democracies it is not given to hairtrigger decisions. Yet a study of its decisions leads, I believe, to the inescapable conclusion that they are sound and that the decisions are in step with the times and generally carefully evolutionary rather than recklessly revolutionary. There is less of the mob psychology in the actions of the House of Delegates than in most democratic bodies, including university faculties with which I am familiar. It is, I think, sound democratic dogma that the approval of the representative body, i. e. the House of Delegates, is, by chapter XVII of the By-Laws required for "the issuance of any memorial, resolution or opinion of any character whatever" in the name of the American Medical Association.

I have found that few of the profession and almost none of the laity seem to grasp the inflexible but democratic principle stated in chapter XVII of the By-Laws. Although it has been stated and restated to the point of monotonous reiteration, it is often regarded even by those who should know as a subterfuge. This democratic principle rightly applies to all, whether officer or Fellow, whether President (or President-Elect) or a paid employee of the Association, whether Trustee, member of a council or Editor. It may be at times painful or pride-pricking for some to admit and explain that the House of Delegates establishes the policies of the Association and not individuals, even presidents, not the Board of Trustees and not any council or committee. And it is sound democratic doctrine.

Since regular sessions of the House of Delegates are held only annually in normal times, the suggestion is often heard that an additional and presumably a midwinter meeting of the House be held. As I see it, the chief advantage would be in timing. For example, the meetings of some state medical societies may be held just before, or just after, or even during the annual meeting of the House of Delegates of the American Medical Association. Under those conditions, any business proposed by a state medical society for action by the House of Delegates of the American Medical Association of necessity lies over for a year. I am inclined to think a midwinter session of the House would help relationship with the constituent associations and would perhaps permit previous publication of business and opportunity for more careful study.

There are occasions when the same policy recently reaffirmed seems to carry more weight than when quoted as adopted a year before. I myself am somewhat skeptical of any great actual and tangible advantages of two meetings a year; but I believe that relations with the constituent associations and with the public would probably be benefited.

While it has been my observation that the House of Delegates conducts all its necessary business in one annual meeting, there are certain facts that may have weight. The growth of the Association has been phenomenal. While the Constitution requires the Board of Trustees to meet only twice a year, at the time of the annual session and in February, the Board customarily meets in addition in September and November, and its executive committee meets nearly monthly. A mass of detail is finally in somewhat abbreviated form passed on to the House of Delegates for its information and action. One wonders if a divided dose might not be easier for the House of Delegates.

It may or may not be pertinent, because the analogy is not at all close, to remark that the legislatures of forty-four states now meet only once in two years, whereas not very long ago annual sessions of state legislatures were decidedly the rule. Of course, there are trends in all such matters and these trends change, sometimes like a pendulum.

With the rapid growth of the Association there has been a tremendous expansion of councils, standing committees and bureaus, all of which were duly authorized by the House of Delegates. All report to the House of Delegates, some directly and some indirectly through the Board of Trustees. In actual practice there seems very little difference.

The work of the various councils, standing committees and bureaus is generally of very high standard. The Council on Pharmacy and Chemistry and the Council on Medical Education and Hospitals have done very notable even if quiet service for the Association for years. It is perhaps invidious to single out these two councils, but they are taken as illustrations. At the present time some of the councils, committees and bureaus are grievously handicapped by the inability to secure competent personnel, owing to wartime conditions.

Despite the most strenuous efforts of the Secretary and General Manager, these problems are still acute. It is to be hoped that the cessation of hostilities will enable for example the reconstruction of the Bureau of Medical Economics. Then too it should shortly be possible to carry out the wishes of the House of Delegates in regard to field agents. This will help the relations with the constituent associations.

It is a source of profound regret that every Fellow of the Association is not familiar with the many and varied activities that go on at 535 North Dearborn Street, Chicago, the headquarters offices. And I refer to the activities there, not the building that houses the activities.

The publications of the Association need no word of praise from me, since they are admittedly the best in the given fields. All of us know some parts of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, admittedly the greatest medical journal in the world. If controversy is any indicator, a greater proportion of readers read the editorials in THE JOURNAL than the editorials of any newspaper that I know. But some readers are addicts of the section on abstracts, while others are addicts of Tonics and Sedatives. I hope most of us know WAR, MEDICINE, which, having served a very valuable service, is passing off the scene. All of us should know the rehabilitated HYGEIA. The special journals seemingly meet a demand. The Directory and the QUARTERLY CUMULATIVE INDEX MEDICUS and some other publications are undertaken as a dutiful obligation to the profession.

The annual assembly is a great scientific event. As the Association has grown, some of the sections have become very large and apparently unwieldy. Some of the smaller sections have readily accommodated themselves to moderately increased audiences. The Council on Scientific Assembly has already made some interesting experiments, for example, with general meetings and panels. The Wartime Graduate Medical Meetings, carried out as a joint enterprise of the American Medical Association, the American College of Surgeons and the American College of Physicians, have done a tremendously

valuable service in meeting the needs of special conditions. This experience will doubtless be helpful to the Council on Scientific Assembly and may be translated into some modification of the meetings at the annual sessions. It must be remembered that large medical meetings are the fashion or the trend, if you will, of the day. Some of these meetings are now in a sense in competition with those of the American Medical Association.

At the moment the Scientific Exhibit is a conspicuous and popular feature of the annual sessions. This may be temporary or it may have suggestion for the sections, which often work in cooperation with the Scientific Exhibit.

With our changing world, one hears at times the query Does the Principles of Ethics, which the House of Delegates has adopted, apply satisfactorily to modern conditions in which economics is such an activating force? Medical practice today has many angles, many contacts, many relationships that did not previously exist. Moreover, there seems to be a relativity about ethics and virtues which make the Principles of Ethics difficult to define in exact terms. To be sure, while life generally certainly becomes more complex and complicated, honor and honesty do not fundamentally change. I have myself posed a few queries and problems to the Judicial Council in regard to certain procedures that seemed to me to involve medical ethics. I have argued somewhat strenuously at times, I fear. But the thoughtful thoroughness of the Judicial Council has convinced me that the code represents the general philosophy of medical ethics and that when and if revision is indicated the Judicial Council will present it to this House.

The American Medical Association belongs to the medical profession of the United States of America. It is a pleasure to report to all Fellows through the House of Delegates that it is my considered opinion that the House of the Association is in good order. I can certify that the funds of the Association are sedulously guarded, that expenditures are made carefully. Although the Association seems prosperous to the point of affluence, that I fear is more apparent than real. With the termination of the war and the resumption of normal programs which have an inevitable tendency to expand, the seeming prosperity may not be very real. In any event up to the present no money has been spent which the Association didn't have and no money has been spent just because the Association had it.

It is always amazing that so many Fellows of the Association give so freely of their time and energy to the Association. Most of them are the unsung privates in the infantry. But it is that loyalty and that devotion which makes the American Medical Association the great organization that it is today, and it is my belief that it will be even greater tomorrow.

(To be continued)

Washington Letter

(From a Special Correspondent)

Dec. 10, 1945.

Director of Veteran Hospital Planning

Major Gen. Paul R. Hawley, acting surgeon general of the Veterans Administration, announced the appointment of Lieut. Col. Harry E. Brown of Minneapolis to be acting director of the Hospital Planning and Operation Service of the Veterans Administration. Major responsibility will be the administering of the Veterans Administration's ninety-seven hospitals under the new plan of separating administration from medical service. He also will be in charge of planning new hospital sites, acquisition of army and navy hospitals declared surplus and enlargement of existing hospitals.

The Proposed Washington Medical Center

Expansion of Washington's privately owned hospital system through creation of a large hospital center in the national capital, with district hospitals donating one third of the expense, is being investigated further by the House District Committee and Senator Millard Tydings, Democrat of Maryland, Major General Fleming, Federal Works Administrator, Representative Sol Bloom, Democrat of New York, Dr. Hugh Cummings, director of Columbia Hospital, Charles A. Garrett and Samuel

H. Kauffman, members of the Emergency Hospital board, William R. Castle of the Garfield Hospital board and Dr. William A. Morgan and Rev. Charles Warner. Veterans officials reveal that a proposed new veterans' hospital for the capital will be built near Walter Reed Medical Center.

Influenza Cases Top Five Year Average

Incidence of influenza throughout the United States is higher than the average of the last five years, boosted by an unusually large number of cases in six states, Texas, South Carolina, Virginia, Colorado, Indiana and Utah. Brock C. Hampton of the United States Public Health Service explained that there were "no reports of any explosive outbreaks of epidemic proportion." The United States Public Health Service is watching with interest the effects of the Army's program to use a new vaccine on 7,000,000 men.

Official Notes

THE SCIENTIFIC EXHIBIT, SAN FRANCISCO SESSION

The Committee on Scientific Exhibit of the Board of Trustees has completed preliminary arrangements for the Scientific Exhibit to be held in connection with the San Francisco session, July 1 to 5, 1946. Prospective exhibitors should start making their plans as early as possible for the meeting.

Application blanks for space in the Scientific Exhibit may be obtained from the Director, Scientific Exhibit, American Medical Association, 535 North Dearborn Street, Chicago 10.

MENTAL HYGIENE TRANSCRIPTIONS READY DECEMBER 15

The Bureau of Health Education announces a new series of electrically transcribed radio health programs on the subject of mental hygiene entitled "Why Do You Worry?" available December 15.

This series of programs is in dramatized form. There are thirteen episodes each dealing with a common everyday adjustment to healthful living. Each program is summarized by a psychiatrist who was originally requested to furnish the basic material for the program and to check the script before it was recorded. The series was prepared under the general supervision of the Bureau of Health Education with the cooperation of Dr. Jules H. Masserman, Department of Psychiatry, University of Chicago, who acted as general consultant and also summarized two of the programs. Scripts were written by William J. Murphy and the dramatizations were produced by Norman Felton; Messrs. Murphy and Felton are respectively script writer and producer for the A. M. A.-N. B. C. network programs *Doctors Look Ahead* and the forthcoming series *Doctors at Home*. Music for the transcriptions is by Hammond organ, with Elwyn Owen the organist. Actors and sound effects and recordings are by the National Broadcasting Company; narration is by Dr. W. W. Bauer.

Following are the lists of program topics, titles and summarizing physicians:

1. Infant, *Bringing Up Baby*, Dr. C. Anderson Aldrich.
2. Preschool, *Toddlers Learn Fast*, Dr. George Mohr.
3. In School, *First Days of School*, Dr. Adrian Vander Veer.
4. Adolescence, *Threshold of Life*, Dr. Maxwell Gitelson.
5. Mental Health of the Adult, *The Road Ahead*, Dr. Franz Alexander.
6. Marriage Adjustment, *Early Adjustments in Marriage*, Dr. George Stevenson.
7. Finding a Job, *Finding the Right Job*, Dr. David Slight.
8. Job Adjustment, *The Job Ahead*, Dr. Burleigh Gardner.
9. Alcoholism, *Paying the Piper*, Dr. Kindwall.
10. Selecting a Life Partner, *Selecting a Life Partner*, Dr. E. W. Burgess.
11. Making Marriage Work, *Making Marriage Work*, Dr. Jules H. Masserman.
12. Depressions, *Trouble in Middle Life*, Dr. Francis Gerty.
13. People We Dislike, *People We Dislike*, Dr. Jules H. Masserman.

These transcriptions will be lent in the same manner as other transcribed material made available by the Bureau. Full information on request.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST; SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Von Urban Loses Reappointment as County Psychologist.—Dr. Rudolph Von Urban, "adviser on sexual problems" for forty-eight years, lost his job as psychologist of Monterey County in September, when members of the board of supervisors failed to reappoint him. Newspapers reported that members of the board declared that they were "frantic" from complaints by taxpayers who resent Von Urban's sex talks before service clubs. In 1944 Von Urban was acquitted of charges that he had practiced medicine without a license. He had been brought into court on a complaint of an investigator for the state board of medical examiners, the state contending that he had been trained as a physician in his native Vienna, had practiced medicine there for many years and therefore was acting as a doctor when he set out to advise Monterey County women. In his defense, Von Urban is said to have defined "sexology" as the "science of occurrence in the soul which teaches people to understand sex instincts" (THE JOURNAL, June 10, 1944, p. 439).

Research Study Club.—The fifteenth annual midwinter postgraduate clinical assembly in ophthalmology and otolaryngology will be conducted by the Research Study Club of Los Angeles, January 21-February 1. Special courses in applied anatomy and cadaver surgery of the head and neck will be conducted February 1-5. Guest speakers will include:

Dr. Oliver E. Van Alvea, Chicago, Clinical Aspects of Otolaryngology.
Dr. Meyer Wiener, St. Louis, Surgery of the Eye.
Dr. Frederick C. Cordes, San Francisco, More Recent Advances in Ophthalmology.
Irving B. Lueck, B.S., Rochester, N. Y., Analysis of Various Optical Problems, with Special Reference to Lenses.
Dr. Herbert M. Evans, Berkeley, Calif., Recent Advances in Nutrition in Relation to Eye, Ear, Nose and Throat Problems and in Reference to Nicotinic Acid and Riboflavin Deficiencies in Man.
Dr. William J. Kerr, San Francisco, Care of the Common Cold.
Dr. Richard Waldapfel, Grand Junction, Colo., The Advancement of Otolaryngology.
Dr. Samuel Salinger, Chicago, Pathology of the Nasal Sinuses and Procedures for Facial and Nasal Reconstruction.
Dr. Samuel Fomon, New York, Plastic Surgery, with Special Emphasis on Physiology of the Nose.
Dr. Charles E. Kinnear, Cleveland, Recent Advances in Surgery for the Hard of Hearing.
Vern O. Knudsen, Ph.D., Los Angeles, Studies in the Field of Hearing and Hearing Impairment.

The American Board of Ophthalmology will conduct an examination in Los Angeles January 28-February 1. The address of the research club is 635 South Westlake Avenue, Los Angeles 5.

DELAWARE

Society News.—The New Castle County Medical Society was addressed November 20 by Drs. Victor H. Vogel, Washington, on "Vocational Rehabilitation and the Medical Profession," and Robert F. Welty, Philadelphia, "Recent Advances in the Treatment of Intestinal Obstruction." Senator James M. Tunnell, Georgetown, addressed the society recently on "Wartime Health and Education and Its Significance in Peacetime Medical Care." Dr. William F. Rienhoff, associate professor of surgery, Johns Hopkins University School of Medicine, Baltimore, addressed the society October 16 on "The Present Status of the Surgical Treatment of Disease in the Thyroid Gland."

GEORGIA

New Gastrointestinal Clinic.—A state gastrointestinal clinic has been opened in the outpatient department of the University Hospital, University of Georgia School of Medicine, Augusta. The new unit will be a division of the cancer clinic of the University Hospital, designed primarily as a diagnostic gastrointestinal clinic with the main objective being the early diagnosis of cancer of the gastrointestinal tract. The clinic will be available to every one. Any one with gastrointestinal symptoms will receive an adequate examination without any fee. It has been noted that a very large percentage of the patients who arrive at the University Hospital with gastrointestinal disease are in a very advanced stage of the disease, many arriving too late for any hope of cure. Because one of the arguments of both patient and physician is that patients with comparatively minor complaints feel they cannot

afford the expense of a thorough examination, it is hoped that the new clinic will serve to bring this group to early attention. The *Journal of the Medical Association of Georgia* states that it is not generally known that from 25 to 30 per cent of all carcinomas are primarily in the stomach. The fact that probably only 5 to 8 per cent of these cancers are curable and that 38,000 people die of cancer of the stomach each year is largely due to a delay in diagnosis. The *Journal* states that until the public has been educated to the importance of seeking medical attention when they have had any gastrointestinal symptom, no matter how minor, for two weeks without any apparent cause, and until the medical profession as a whole feels that these patients are candidates for thorough examinations with the possible diagnosis of cancer considered, until proved otherwise, cancer of the gastrointestinal tract will continue to take a high toll of human life. Additional information concerning the new clinic may be obtained from the University of Georgia School of Medicine, Augusta.

ILLINOIS

Southern Illinois Election.—Dr. Charles D. Nobles, Anna, was elected president of the Southern Illinois Medical Association at its recent meeting in Mount Vernon. Other officers are Drs. Willis I. Lewis, Herrin, vice president and Thomas B. Williamson, Mount Vernon, secretary-treasurer. The next annual meeting of the association will be held in Anna.

Chicago

Personal.—Dr. Herman L. Kretschmer, Past President of the American Medical Association, was recently elected chairman of the board of editors of the *Journal of Urology*.—Dr. William H. Cassels has been promoted from associate professor of anesthesia to professor of anesthesia at the University of Illinois College of Medicine.

The McArthur Lecture.—The twenty-second Lewis Linn McArthur Lecture of the Frank Billings Foundation will be delivered at the Palmer House, February 22, by Dr. Armand J. Quick, professor and director of the department of biochemistry, Marquette University School of Medicine, Milwaukee. His subject will be "The Coagulation of the Blood: Theoretical and Practical Aspects."

Administrative Director of Hektoen Institute Named.—At the recent annual meeting of the board of trustees of the Hektoen Institute for Medical Research of the Cook County Hospital, Dr. Samuel J. Hoffman was appointed administrative director of the institute. Dr. Karl A. Meyer is president of the board. Dr. Steven O. Schwartz, hematologist for Cook County Hospital, was appointed hematologist to the Hektoen Institute.

LOUISIANA

Million for Tropical Medicine.—Tulane University of Louisiana School of Medicine, New Orleans, has received a bequest from Miss Sarah Henderson of \$1,075,000 for endowment of the chair of tropical medicine and for the improvement and changes in the department.

Appointments at Tulane.—William B. Wendel, Ph.D., associate professor of chemistry at the University of Tennessee College of Medicine and School of Biological Sciences, has been appointed professor and head of the department of biochemistry at Tulane University of Louisiana School of Medicine, New Orleans. Dr. Champ Lyons, formerly a member of the staff of Harvard Medical School and recently consultant to the secretary of war, Hemolytic Streptococcus Commission, has been appointed associate professor of surgery at Tulane.

MARYLAND

The Seton Institute.—Mount Hope Retreat, Baltimore, is undergoing a reorganization that includes a change in name and an extension of service for mental care. The name Mount Hope Retreat will be discontinued and henceforth the organization will be known as the Seton Institute. As part of the reorganization plan there is to be established an entirely new section in the institution as an "acute service." This section will be set up for the care and treatment of the milder emotional disorders. It will consist of four separate units of about 20 beds each, most of which are to be in private rooms, some with private baths. Each unit will be under the supervision of a competent psychiatrist with an adequate staff of graduate nurses, occupational therapists, physical therapists, recreational technicians and trained attendants. The plans of the Seton Institute include what is said to be unprecedented policy in the psychiatric field. An active staff is to be created similar to such staffs in general hospitals. Psychiatrists elected to

the active staff will have the privilege of admitting their private patients to the Seton Institute and to treat them personally according to the privileges and advantages now enjoyed by the general practitioner, the internist and the surgeon in the general hospital. It is the intent of the governing authorities and the medical advisory board to set up, as rapidly as possible, the professional and personnel standards of the entire institution so as to equal those of the highest psychiatric requirements. It plans to provide facilities for the training of psychiatric interns and for the three years of postgraduate service required of the specialists certified by the American Board of Psychiatry and Neurology. A medical advisory board consists of Dr. Wendell S. Muncie, Baltimore, chairman; Dr. Horace K. Richardson, Baltimore, secretary; Dr. Lewis B. Hill, Baltimore; Dr. Arthur J. Lomas, Lutherville; Dr. Ralph C. P. Truitt, Baltimore, and Dr. Esther L. Richards, Baltimore. A clinical director is to be appointed, and applications from candidates for this position are now invited. Applications may be forwarded to Dr. Richardson, secretary, 11 East Chase Street, Baltimore 2.

MICHIGAN

Seeks Oldest Physician in State.—The Michigan State Medical Society has recently issued a questionnaire to local secretaries in an effort to locate the oldest doctor of medicine in the state, whether a member of the society or not. The society plans a feature article on the oldest practitioner in a forthcoming issue of its state journal.

Personal.—Dr. Walter J. Cree, Detroit, who holds emeritus membership in the Michigan State Medical Society and the Detroit Academy of Medicine, was guest of honor at a luncheon held in conjunction with the Seniors Meeting of the Wayne County Medical Society, Detroit, October 17.—Dr. and Mrs. Holton M. Lowe, Battle Creek, celebrated their fiftieth wedding anniversary August 14.

Diagnostic Centers for Rheumatic Fever.—Nine diagnostic centers for rheumatic fever control are being organized in the cities of Ann Arbor, Bay City, Flint, Grand Rapids, Jackson, Kalamazoo, Lansing, Marquette and Traverse City under the auspices of the Michigan State Medical Society and the county medical society in whose area the project will be located. These are in addition to the cardiac centers maintained in Detroit. The work is to be limited to consultation and diagnostic service. No treatment will be permitted. No charge will be made to indigents for consultation service, the Michigan Crippled Children Commission assuming the cost of these fees. Private patients will be charged. All cases are to be reported to the Michigan Department of Health, and accurate records and follow-up reports are to be kept. All treatment services are to be given by the family practitioner.

NEBRASKA

New Director of Venereal Disease Control.—Dr. Walter B. Quisenberry, who recently completed a course at the Johns Hopkins School of Hygiene and Public Health, Baltimore, has been appointed director of the state division of venereal disease control, succeeding Dr. Reginald A. Frary, Lincoln, who resigned in November 1944 (*THE JOURNAL*, Dec. 23, 1944, p. 1095) to enter private practice in Monroe, Mich. Dr. Quisenberry graduated at the College of Medical Evangelists, Loma Linda-Los Angeles, in 1941.

Personal.—Dr. John R. Schenken, formerly professor and head of the department of pathology and bacteriology, Louisiana State University School of Medicine, New Orleans, has been appointed director of laboratories at the Nebraska Methodist Hospital, Omaha.—Rev. Emil G. Chinlund, for more than twenty-five years director of Immanuel Deaconess Institute, Omaha, has resigned but will remain in office for the remainder of the current year.—Dr. William E. Holmes, Omaha, has been named director of the Scotts Bluff County Health Department.

NEW YORK

Drive Against Antivivisectionists.—The Medical Society of the State of New York, at the recent meeting of its house of delegates, urged the appointment of a special committee to determine and formulate on a statewide basis an effective educational and defensive program to combat the growing antivivisection threat. The action was the result of a resolution introduced by the Medical Society of the County of Erie, which has a newly created committee for the defense of medical research. The resolution recommended that every county medical society in the state establish without delay a similar committee. It has pointed out that the preservation of animal

experimentation may well be maintained through the agency of a statewide network of county defense committees working in unison and efficiency under the guidance of an overall state society group.

Fellowships in Public Health.—The New York State Department of Health has available a limited number of fellowships for physicians returning from service who wish to equip themselves with the necessary field and academic experience for the practice of civilian public health on a full time basis. Six to twelve months of orientation and field work are provided under the guidance of experienced district state health officers, followed by an academic year at a postgraduate school of public health where the master's degree in public health is earned. Fellowship provisions are generous and include tuition. Those completing the training are professionally qualified for appointment on the staff of most local and state health departments. Additional information concerning necessary requirements may be obtained from the New York State Department of Health, Albany 1.

New York City

The Harvey Society Lecture.—George Wald, Ph.D., associate professor of biology, Harvard Medical School, Boston, will deliver the third Harvey Society Lecture of the current series at the New York Academy of Medicine on December 20. Dr. Wald will speak on "The Chemical Evolution of Vision."

Deaths from Carbon Monoxide.—More than six hundred accidents resulting from escaping gas containing carbon monoxide were reported to the New York State Department of Health in 1944. Of these, 314 terminated fatally. During the first nine months of 1945 preliminary totals show that 225 persons were killed by poisonous gases.

Faculty Changes at Long Island.—Dr. Phillips F. Greene, clinical professor of surgery, Long Island College of Medicine, has been appointed associate dean in charge of the administrative office of the college division at Kings County Hospital. Dr. Greene was formerly professor of surgery and dean of the Yale-in-China National Huing Ya Medical College in Changsha, China. Dr. Duncan W. Clark, Brooklyn, was also named associate dean, according to the *Bulletin* of the Long Island College of Medicine.

Friday Afternoon Lecture Series.—The twentieth series of Friday Afternoon Lectures of the New York Academy of Medicine, which began November 2 (*THE JOURNAL*, September 29, p. 371), continues as follows:

- Dr. Richard H. Freyberg, Current Views of Rheumatic Diseases and Their Management, January 4.
- Dr. Fordyce Barker St. John, Cancer of the Stomach—Surgical Aspects and Means for Early Diagnosis (the L. Duncan Bulkley Lecture), January 11.
- Capt. Arthur M. Master (MC), Apical Systolic Murmurs in Incipient Rheumatic Heart Disease, January 18.
- Dr. Samuel Silbert, Medical Treatment of Peripheral Vascular Disease, January 25.
- Dr. Williams Andrus, Present Concepts of Treatment of Burns, February 1.
- Dr. Solomon Fineman, Roentgenologic Aspects of Diseases of the Heart and Lungs of Importance to the General Practitioner, February 8.
- Dr. Henry E. Meleney, Diagnosis and Treatment of Malaria, February 15.
- Dr. Robert H. E. Elliott Jr., Disorders of the Spleen, with Special Reference to Those Amenable to Surgical Therapy, March 1.
- Dr. James William Hinton, The Indications for Surgery in the Treatment of Gastric and Duodenal Ulcers, March 8.
- Dr. Lawrence S. Kubic, Rehabilitation of the Psychiatric Convalescent, March 15.
- Dr. Henry L. Jaffe, Fibrous Dysplasia of Bone, March 22.
- Dr. Dana W. Aitchley, Treatment of Neuroses by the Internist, March 29.
- Dr. Ephraim Shorr, Metabolic Aspects of Renal Stone Formation, April 5.

OHIO

Payment to Physicians for Furnishing Affidavits to Industrial Commission Rescinded.—When the Ohio Industrial Commission adopted a revised medical and surgical fee schedule, effective last May 1, it provided for a fee of \$3 for "affidavits furnished by physicians upon request of the commission containing information used as a basis for adjudication of the claim." This was done on recommendation of the Ohio State Medical Association (*THE JOURNAL*, June 23, p. 605). This provision was rescinded by action of the commission on October 15 and such revocation took effect on October 28. All fee bills for furnishing such affidavits at the request of the commission received and approved by the commission prior to the rescinding of that section of the fee schedule will be paid, but bills received after that date will be rejected. According to members of the commission, this action was necessary because of a combination of circumstances which left the commission without resources to meet

such payments. It had been anticipated that such fees would be paid out of the funds from which compensation and medical, hospital and nursing expenses are paid, namely the state insurance fund, consisting of premiums paid by employers. However, the attorney general on July 19 ruled that a fee for affidavits could not be legally charged against the insurance fund but must be considered a part of administrative expenses.

OKLAHOMA

Richard Graham Returns as Executive Secretary.—Richard H. Graham, who recently was relieved from military service, has resumed his activities as executive secretary of the Oklahoma State Medical Association.

Bert Caldwell Makes Hospital Surveys.—Dr. Bert W. Caldwell, Chicago, former executive secretary of the American Hospital Association, has been engaged to make a survey for the state board of health of the hospital facilities of Oklahoma.

PENNSYLVANIA

Personal.—Dr. William Ford, member of the medical staff at the Lewisburg Federal Penitentiary since 1938, has been appointed chief medical officer, to succeed Dr. Edward C. Rinck.

Philadelphia

Faculty Changes at Woman's Medical College.—Among recent changes in the faculty at Woman's Medical College of Pennsylvania are the following:

Dr. Margaret DeRonde, Norristown, Pa., to clinical associate professor in psychiatry.

Dr. Mary R. Curcio to clinical assistant professor of medicine.

Dr. Mildred C. J. Pfeiffer to clinical assistant professor of medicine.

Maria Wiener, Ph.D., to assistant professor of bacteriology.

Dr. F. Marin Williams to clinical assistant professor of gynecology.

Philip White Joins Research Institute.—Philip R. White, Ph.D., since 1938 associate in the department of animal plant pathology, Rockefeller Institute, Princeton, N. J., has resigned to become a member of the staff of the Institute for Cancer Research at Lankenau Hospital Research Institute, according to *Science*. Dr. White, who was to take up his new work December 1, will organize and direct a division of general physiology and tissue culture dealing with problems in tumor growth.

Bequest for Medical Care.—The University of Pennsylvania Hospital and Dr. John Diven, Philadelphia, are each bequeathed \$50,000 for free hospital care and medical attention to indigent persons in the will of Mrs. John Scanlin Scott, a widow, formerly of Philadelphia, who died recently in New Philadelphia, Ohio. Mrs. Scott wrote "I make the bequest to Dr. Diven so that he may carry out plans which he and I have discussed for the benefit of poor children who are in need of medical or other care and attention." The university's trustees are to administer the hospital's gift trust fund, the income of which will provide full maintenance of two beds every day in the year.

Personal.—Lieut. Col. Pascal F. Lucchesi, who for the past twenty-two months has been in Uruguay as chief of a health and sanitation mission for the Commission of Inter-American Affairs, has been released by the army and has resumed his duties as superintendent and medical director of the Philadelphia Hospital for Contagious Diseases. —William L. Hughes, Ph.D., professor of physical education, Teachers College, Columbia University, New York, and president of the American Association for Health, Physical Education and Recreation, has been appointed director of the health and physical education department of Temple University. Among other activities he has been a consultant for the postwar health and athletic facilities planning committee of the Philadelphia public schools. —Dr. Harvey Bartle, formerly medical director Pennsylvania Railroad System, has been named medical director at the Cramp Shipbuilding Company. He will succeed Dr. Kenneth A. Koerber, who resigned to become medical director at the Electric Storage Battery Company. —Dr. Mario A. Castallo, associate professor of obstetrics, Jefferson Medical College, on October 28 received an honorary degree of doctor of science from Holy Cross College, Worcester, Mass. —Dr. John A. Bertolet, treasurer of the Philadelphia County Medical Society, was elected coroner of Philadelphia County recently. Dr. Bertolet has been filling this office by appointment from the governor since the death of his predecessor, Dr. Herbert M. Goddard.

TENNESSEE

Personal.—Dr. Walter J. Johnson, Pulaski, has been appointed a member of the Tennessee State Board of Medical Examiners, succeeding Dr. James H. Keeling, Knoxville, who died September 1. —Dr. Marion G. Fisher, Jonesboro, has resigned as director of the Washington County-Johnson City health department to accept a similar position of the Lorraine County (Ohio) health department with headquarters in Oberlin, it is reported.

Cancer Clinic Open.—The Memphis Cancer Clinic was opened for patients October 1. It is under the direction of Dr. Douglas H. Sprunt, professor and head of the department of pathology, University of Tennessee College of Medicine, Memphis. It will be operated jointly by the Field Army, University of Tennessee, John Gaston Hospital and Shelby County Medical Society. Facilities will be at Gailor Clinic for diagnosis and recommendation for treatment.

Resolutions Honor Service to Medical School.—Resolutions paying tribute to Dr. Waller S. Leathers and Dr. Lucius E. Burch for their long service to the Vanderbilt University School of Medicine, Nashville, were adopted October 31 at the first fall meeting of the school faculty. Dr. Leathers, who retired in July, had been dean of the medical school and head of the department of preventive medicine and public health since 1928 (*THE JOURNAL*, June 23, p. 606). Dr. Burch, who also retired June 1 (*THE JOURNAL*, July 15, p. 820), graduated at Vanderbilt in 1896, joined the faculty in 1902 as professor of gynecology and was dean of the school from 1914 until 1925, when he resigned as dean to continue as head of the department of obstetrics and gynecology.

TEXAS

Hospital Receives Bequest for Pathologic Research.—The Hermann Hospital, Houston, will receive an income from Houston real estate valued at more than \$200,000 under a bequest by the late Dr. Oscar L. Norsworthy, first chief of staff at the hospital, who died Jan. 5, 1935. The fund will be used for pathologic research.

Seminar on Carcinogenesis.—Edmund V. Cowdry, Ph.D., professor of anatomy, Washington University School of Medicine, St. Louis, and director of research of the Barnard Free Skin and Cancer Hospital, will hold a special seminar on carcinogenesis at the Tumor Clinic of the University of Texas Medical Branch, Galveston, December 21.

Southwestern Medical Foundation Seeks Operating Fund.—The Southwestern Medical Foundation has opened a drive to secure \$1,300,000 for a five year operating fund. This fund is entirely separate from the building fund, for which \$1,000,000 was raised in 1943 to build a medical college in Dallas adjacent to the city-county hospital. An enlarged medical program in the city and county has necessitated the establishment of an operating fund. The medical college has not made demands on the city-county hospital which would increase the budget and has received no money from tax supported budgets. Instead, the school has contributed to the care of the sick by paying for the services of physicians who render service to indigent patients of Dallas County. Expense for this purpose amounts to \$50,000 a year, which is defrayed by the foundation. In addition it carries on research programs which are available to the city-county hospital.

WISCONSIN

Personal.—Dr. and Mrs. Ulysses S. Grant Keller, Madison, observed their fiftieth wedding anniversary September 10. —Dr. James J. Fitzgerald recently completed fifty years of service in Eagle.

District Society Honors William Middleton.—The Third Councilor District Medical Society devoted a recent meeting to honoring Lieut. Col. William S. Middleton, dean of the University of Wisconsin Medical School, Madison, who had just returned from military service. Dr. Middleton served as chief consultant in medicine for the European Theater of Operations, for which service he was awarded the Croix de guerre for "exceptional service during the liberation of France." Dr. Middleton spoke on his activities in Europe.

Annual Dearholt Day.—The sixth annual "Dearholt Day" was observed in Madison November 19 under the auspices of the Wisconsin Anti-Tuberculosis Association in collaboration with the University of Wisconsin Medical School, Madison, and the Dane County Medical Society. The speakers included Drs. Carl N. Neupert, Madison, assistant state health officer, Horton C. Hinshaw, Rochester, Minn., who discussed "Chemo-

therapy in Tuberculosis," and Leo G. Rigler, Minneapolis, "Emphysema and Atelectasis in the Diagnosis of Pulmonary Diseases." The observance honors the late Dr. Hoyt Dearholt, who is credited with founding the Wisconsin Anti-Tuberculosis Association. In Milwaukee, November 20, the observance was sponsored by the Marquette University School of Medicine, Milwaukee, and the Milwaukee Academy of Medicine. The same program was presented. The Wisconsin Trudeau Society cooperated in both events.

State Medical Election.—Dr. Charles A. Dawson, River Falls, was chosen president-elect of the Wisconsin State Medical Society at the annual meeting of the house of delegates of the Wisconsin State Medical Society in Milwaukee, October 20-21, and Dr. Patrick R. Minahan, Green Bay, was installed as president. Dr. William D. Stovall, Madison, is delegate to the American Medical Association. The 1946 annual meeting will be held in Milwaukee October 6-9. The society went on record as favoring a comprehensive surgical, obstetric and hospitalization insurance plan, which, it is estimated, will serve as full coverage for a major percentage of the workers and their families in Wisconsin. It is expected that the plan will be put into effect shortly after the first of the year. The plan will grant complete surgical coverage to employees, with dependents, having an income of less than \$2,600 a year and to single employees having an income of less than \$2,080 a year. For those having higher incomes the same benefits will apply, although the physicians do not guarantee that such payments constitute payment in full.

GENERAL

The March of Dimes.—January 14-31 has been designated as the annual March of Dimes of the National Foundation for Infantile Paralysis. Local chapters of the National Foundation have disbursed close to \$5,000,000 this year to cope with widespread epidemics that have claimed nearly 13,000 victims this year to date, making 1945 the fourth worst poliomyelitis period in the recorded history of the disease in this country.

Dr. Cumming Observes Anniversary with Sanitary Bureau.—On December 20 Dr. Hugh S. Cumming, formerly Surgeon General of the U. S. Public Health Service, will complete his twenty-fifth year as director of the Pan American Sanitary Bureau. Dr. Cumming, when he retired as surgeon general in 1936, had completed sixteen years in this position and forty-two years as a member of the U. S. Public Health Service. On his retirement from the service, Dr. Cumming devoted his full time to the directorship of the Pan American Sanitary Bureau. To mark his twenty-fifth anniversary, the republic of Guatemala has just granted him a gold medal.

Reprints for the Devastated Medical Libraries of Manila.—In connection with its campaign to help rebuild the medical libraries of Manila which were destroyed during the Japanese occupation, the Academy-International of Medicine requests that medical authors contribute eight or ten reprints of each of their articles which have been published since 1941. They may be sent at the regular parcel post rate of 16 cents for the first pound and 11 cents for each additional pound, in care of Dr. Agerico B. M. Sison, Philippine General Hospital, Manila, P. I. Dr. Nathan S. Davis, Chicago, is president of the Academy-International of Medicine and Dentistry, which has offices in Suite 101, Liberty Building, Topeka, Kan.

Prepayment Medical Care Organizations.—The Federal Security Agency has just made available as Bureau Memorandum number 55 the third edition of its work entitled "Prepayment Medical Care Organizations." The pamphlet may be secured from the United States Government Printing Office at 25 cents a copy. It contains a complete survey of all prepayment medical care organizations which made information available to the Social Security Board up to March and April 1945. A statistical summary provides information concerning each state, the type of plan, the number of persons eligible for service, the number of physicians and nurses associated with the plan and the types of service provided.

Warning of Forger.—William B. Pierce is wanted by the police for larceny, fraudulent conversion and forgery at the Philadelphia General Hospital. According to a warrant issued by the police department, Pierce is said to have qualifications to fill almost any position in a hospital. He is a good artist and can operate cardiographic equipment with ease. He is a former convict, having served time for the charges of forgery and larceny of government property, and at present is

a parole violator. Since he is known to have worked in large hospitals in major cities, staff members and employers of hospitals are asked to be on the lookout for him. Should he make his appearance, persons are requested to notify the local police department, post office inspectors or the F. B. I.

Nutrition Grants.—New grants of \$120,565 were announced by the Nutrition Foundation at a meeting of the board of trustees at the Waldorf Astoria, New York, November 8. The new grants bring the total for fundamental research for science of nutrition made by the foundation up to \$1,041,755. Included among the new grants are the following:

Stanford University received \$5,000 for a two year study of the distribution of body protein under changing conditions.

Yale University received \$5,000 for a two year study of the chromatographic adsorption analysis of fatty acids and carbohydrates.

The University of Wisconsin received \$10,500 for a three year study of the effect of dietary components on the requirement of amino acids.

The University of Toronto received \$8,000 for a two year study of the relation of carbohydrates to inositols.

Tulane University received \$4,250 to study nutritional anemia in man.

The University of California received \$2,400 for a two year study of the metabolism of amino acids in the chick.

Pennsylvania State College received \$10,000 for a two year study of spectrographic methods of estimating vitamin A and provitamin A.

Cornell University received \$7,000 for a two year study of the function of essential nutrients.

Duke University received \$4,000 for a two year study of fatty livers and choline deficiency in the guinea pig.

Northwestern University received \$12,000 for a two year study of the human requirements of niacin and related nutrients.

Growth Committee Has Central Office.—The Committee on Growth, recently formed within the Division of Medical Sciences of the National Research Council as a result of action by the American Cancer Society, has established a central office in the Washington headquarters of the council where information on all phases of cancer research will be assembled and from which reports may be distributed to interested investigators. The Committee on Growth wishes to call the attention of interested investigators to the following major principles by which it will be guided as far as possible in its sponsorship of research and training programs:

Desirability of long-term grants to projects of major importance.

Grants, where possible, of such magnitude as to permit individual investigators to appoint associates for long-term training periods.

Granting of fellowships to institutions for training of workers to acquire new techniques and wider experience.

Maintenance of continuing individual contact with workers in the field.

Provision, on a participating basis, for continuing economic security for professional workers.

Liberal attitude toward the investigator's work, his publication and reports.

Formation of the committee on growth and its officers were reported in THE JOURNAL, June 23, page 607. The Committee on Growth may be reached through the Division of Medical Sciences, National Research Council, 2101 Constitution Avenue, Washington 25, D. C.

Production of Penicillin.—Although production of penicillin dropped in September, production in October increased, members of the Penicillin Producers Industry Advisory Committee reported to the War Production Board October 31. Actual production of penicillin in the third quarter (in billions of units) was 688.98 in July, 636.51 in August and 586.37 in September. Estimated production in the fourth quarter is 61.47 in October, 657.96 in November and 698.10 in December. The decreased production in September resulted from the poor quality of corn steep liquor received by the penicillin producers. The poor quality was caused by the fact that the only corn available was of an inferior grade. Although the industry has made provision for further purification of the corn steep liquor at the plant, the War Production Board is taking steps to arrange for the production of a higher grade of corn steep liquor. WPB officials suggested that expert controls on penicillin should be restored to enable records to be kept of the quantities of penicillin leaving the country. The department of commerce and members of the committee concurred in this suggestion. So that hospital requirements for penicillin in all forms may be met in full, WPB officials and the committee agreed that an order or directive should be issued giving hospitals first call on penicillin production.

CORRECTION

Frederick Eugene Porter Not Dead.—THE JOURNAL, December 1, page 978, inadvertently reported the death of Capt. Frederick Eugene Porter (MC), U. S. Navy (ret.). The report of death was confused with that of a person having a similar name but who is not licensed to practice in California. Dr. Porter is commanding the U. S. Naval Special Hospital, Santa Cruz.

The Coordinating of Research on Rheumatic Fever and Heart Disease

The annual Harveian Oration, founded by Harvey in 1656, was delivered at the Royal College of Physicians by Dr. John Parkinson, cardiologist, who spoke on rheumatic heart disease. Rheumatic fever in childhood is the main source of heart disease up to the age of 40. The damage occurs between the ages of 5 and 15 years and exceeds tuberculosis as a cause of death up to the age of 20. It is estimated that almost one tenth of all rejections for war service were due to heart disease. The economic loss can be judged by the fact that the duration of economic activity of affected men is no more than ten years on an average. It is agreed that poverty and overcrowding are basic causes; rheumatic fever is rare in the children of the well-to-do. There is almost unanimous opinion that compulsory notification of rheumatic fever is essential to progress, for it permits early diagnosis before heart disease has occurred. The excellent scheme now in operation by the London County Council is regarded in the United States and elsewhere as the most comprehensive in existence. But institutional treatment from the outset and subsequent supervision have to be extended to every case of rheumatic fever. There should be created a rheumatic fever committee to coordinate research and plan for the future. Dr. Parkinson believes that the Royal College of Physicians is prepared to assume leadership in this organization. The objective should include one main county hospital for research and hospitals and clinics to serve all densely populated areas. Ultimately it will be found necessary, as it has been in the United States, to create a national council for rheumatic fever and heart disease.

"Acroparesthesia" of the Hands

Dr. F. M. R. Walshe, a neurologist, has shown that the "acroparesthesia" of the hands and arms in women, which is generally diagnosed as "neuritis," has a simple mechanical explanation (*Brit. M. J.* 2:596 [Nov. 3] 1945). During the war he has seen an unusual number of such cases. The largest group consists of middle aged or elderly women normally unaccustomed to full house work but obliged to undertake it during the war. The other group consists of younger women who, in addition to their house work, have done part time work in industry or have had the burden of child care. There was a gradual onset of intense numbness and tingling in the hands and fingers, which was greatest on waking in the morning, when the fingers were clumsy and weak. By the time the patient had dressed, the symptoms had diminished but the fingers remained uncomfortable and less nimble than normal. At the end of the day the symptoms increased again. During the night burning pain and paresthesia in the fingers might awaken the patient. In other cases night brought relief. Treatment which consisted of the administration of vitamins or physical therapy was not satisfactory.

On physical examination these patients showed general indications of chronic fatigue. The musculature was atonic and often the shoulder girdles were remarkably low. Muscular wasting was not present, but also always there was tenderness of the extensor muscles in the forearm and sometimes of the thenar and adductor muscles of the thumb. Objective sensory loss was exceptional; there might be some dulling of sensibility of the fingers. Occasionally there was cyanosis or pallor of the fingers.

This condition is a rib pressure syndrome but is not due to a rudimentary seventh cervical or first thoracic rib but to a normal first rib. Atony of the muscles leads to lowering of the shoulder girdle with traction and compression of the lower trunk of the brachial plexus, which may be caught as in a vise. Whereas the pressure syndromes due to a rudimentary cervical or first thoracic rib are usually unilateral because the thoracic outlet is commonly asymmetrical, the normal first rib syndromes are bilateral because the thoracic outlet is symmetrical and the sagging of the shoulder girdles—dependent on general loss of muscular tone—is also bilateral. If the symptoms are more apparent on one side, it is usually the right, because the right hand is more heavily used than the left. Rest in bed or simple cessation of mechanical work gives immediate relief. This view of the etiology of acroparesthesia is not new and has been presented by other writers in the past, notably by Wartenberg (1936, 1944). It has been overlooked by clinicians, and failure to understand the cause of the paresthesia leads to futile treatment. However, the connection of the paresthesia with fatiguing work of women during the war appears to be quite new.

BELGIUM

(From a Special Correspondent)

Nov. 3, 1945.

Therapy of Arteritis of the Lower Extremities

In the discussion on endarteritis obliterans before the Belgian Society of Physical Therapy Williams pointed out that spasm is an important factor. The therapy of the condition has three objects: to counteract infection, to establish a sufficient collateral circulation and to remove or attenuate pain. The physical therapeutic methods employed are irradiation and diathermy, which are especially indicated in spasm. However, diathermy may aggravate the pain. Infra-red rays, light baths and dry warm air are especially effective in endarteritis obliterans. The collateral circulation can be favorably influenced by an apparatus which exerts rhythmic pressure variations on the involved member. Pressures between 20 and 80 mm. of mercury are exerted, depending on the nature of the case. This procedure leads to permanent dilatation of the collateral arterioles and it aids in the reestablishment of the normal circulation of the skin. In cases of permanent spasm it is advisable to combine this method with lumbar sympathectomy.

The Medullary Route in Metallic Osteosynthesis

At a meeting of the Belgian Society of Surgery, Soeur presented Kuntscher's technic of nailing by the intramedullary route. He demonstrated the instruments employed and showed twelve old fractures of the extremities that had been treated between 1943 and 1945. There were four fractures of the bones of the forearm, two of the humerus, three of the tibia and three of the femur; all were diaphysal. Soeur stressed the simplicity of the technic and the excellent results. The essential points of the method are good reduction, perfect maintenance and early mobilization. The nails are removed three to six months after their introduction.

Reunion of English, French and Belgian Surgeons

At a meeting of the Association of Surgeons of Great Britain and Ireland several Belgian surgeons extended to our French and British friends an invitation to renew associations after the cruel years of separation caused by the German occupation of the major part of Europe. This reunion took place in Liège on July 6 at the Hôpital de Bavière in the services of Professors Albert and Orban and on July 7 in the new surgical unit of the Hôpital d'Etterbeek, where Professor Leriche performed a resection of the lumbar sympathetic nerves.

Technic of Secondary Partial Gastrectomy

Deloyers and Govaerts reported before the Surgical Society of Belgium results obtained in 27 cases of secondary partial gastrectomy. In greatly debilitated patients it is advantageous to perform the operation in two stages; the gastrectomy is not done until three months after the first stage, which involves restoring the continuity of the jejunum by end to end anastomosis. In 19 cases the secondary partial gastrectomy was accomplished in one stage; 4 of these patients died of the usual postoperative complications. The mortality rate is much like that of von Haberer (15 per cent).

Deloyers and Govaerts advocate the extensive removal of the old stoma, gastric as well as jejunal, and insist that the new jejunal stoma be placed below the sutures of the old excision. The technic employed is the Reichel-Polya type; it gives entirely satisfactory results, because it effects excellent emptying but completely eliminates the secretory area of the stomach.

GERMANY

The following medical news has been obtained through the Department of Commerce, Washington, D. C.—EDITOR.

University of Freiburg Department of Pathology

Prof. Franz Büchner, the director of the department of pathology of the University of Freiburg, was visited on May 27 at his home, Holbeinstrasse 32, Freiburg im Breisgau. He gave an account of the work of his department in considerable detail. The work he had done during the war was really an extension of his interests on the effects of oxygen deficiency on the heart muscle. In 1939 he had published a book on coronary insufficiency, *Die Koronarinsuffizienz* (Dresden and Leipzig, Theodor Steinkopf). He observed that severe suffocation, carbon monoxide poisoning, severe anemia and exposure to low levels of oxygen pressure were followed by a punctate necrosis in the cardiac muscle and that this was accompanied by a deformation of the ST complex of the electrocardiogram. He extended these experiments and showed that guinea pigs exposed to low oxygen pressure which finally proved fatal showed varying degrees of ganglion cell necrosis in the central nervous system, especially the medulla oblongata. In 1942 Altman and Schuboth in an article entitled "Funktionelle und organische Schädigungen des Zentralnervensystems der Katze im Unterdruckexperiment" (*Beitr. z. path. Anat. u. z. allg. Path.* 107:1, 1942) showed that in cats the areas of the brain which were sensitive to oxygen lack, as shown by microscopic examination, were those areas which showed electroencephalographic changes under the same conditions.

Professor Büchner also remarked that in advanced cases of blood loss similar microscopic changes were found post mortem. In reply to a question as to whether Periston had been used to any considerable extent in cases of severe hemorrhage, he said that as a result of his experiments Professor Lang, the head of the Physiologisch-Chemisches Institut der Militärärztlichen Akademie in Berlin had recommended the use of serum and apparently had also organized this. Another subject which interested his department was the effect of chilling and low temperature in relation to the body glycogen. Prolonged exposure to cold causes the disappearance of the cardiac glycogen. The effects of cold and other noxious agents on the lipid content of the adrenals have also been investigated. The lipid content of the adrenal is most sensitive to attack. A considerable amount of work on infectious hepatitis has likewise been done and a manuscript by Kühn, one of his assistants, is awaiting publication. The manuscript appears to be well illustrated. Although it was not possible to go through it in any detail, mention is made here of its existence in case it may be of interest. Büchner mentioned that he had come across a very rare sequela to infectious hepatitis, namely cirrhosis.

ORGANIZATION OF THE LABORATORY

Professor Büchner stated that most of his staff had already been with him before the war, but a pathologic section was formed in his laboratory by the Air Ministry, and by this means he was able to keep his staff together during the war. Thus, he had four assistants for the Air Ministry section of his work and only one so-called civilian assistant. The work carried on under the auspices of the Air Ministry was mainly a continuation of his general type of research. The following list of his present staff was obtained: Dozent Dr. G. Liebegott; Dr. G. Veitly (army pathologist in Italy); Dr. H. W. Altmann, Dr. H. A. Kühn and Dozent Dr. G. Peters, located in St. Blassien since the laboratory was destroyed, and D. J. Pidrotka (Brannenburg on Inn).

CHEMICAL SECTION

After the raid of Nov. 27, 1944 a part of the laboratory which was under the direction of Dr. H. J. Staudinger (in Freiburg) was left, but the chemical section was completely destroyed. Nevertheless it had been possible to rescue most of the books and apparatus from the cellars, where they had been put for safety.

During the interrogation, Professor Büchner stated that Prof. Dr. S. Janssen, professor of pharmacology, Freiburg, Sonnenhalde 14, had continued his work on the various fractions of the pituitary but had had few assistants during the war and had done no pharmacologic work for the German government.

Hygiene Institute, University of Tübingen

Prof. Otto Stickl is the director of the Hygienisches Institut of the University of Tübingen. This institute is concerned with academic teaching and research and does the routine bacteriologic testing for the Württemberg area. As many as seventy to eighty thousand tests are performed annually. The institute appeared to be well equipped, but Professor Stickl reported that some ten days previously the French authorities had removed his electron microscope, some photographic apparatus and his experimental protocols. Other apparatus, including an ultracentrifuge, still remained. Professor Stickl's main interests have been the sulfonamides, epidemic hepatitis and dibromosalicyl. He had been examining in mice the effects of the sulfonamides on intestinal and dysentery organisms, particularly with regard to the distribution of the drugs in the various body fluids, and the nature of their action on the bacteria. No outstanding results were reported. It was interesting that while he had examined Globucid, Pyrimal, Albucid and sulfapyridine, he had not examined sulfanilylguanidine or Marfanil. He considered that Globucid and Pyrimal were about equally effective (no work on penicillin had been done).

Professor Stickl had investigated a number of cases of epidemic hepatitis, which had come mainly from the eastern front, especially from Stalingrad, in 1942. In reply to a question, he stated that he had no experience with hepatitis occurring after injection of serum. Detailed protocols were not in Professor Stickl's possession.

A sample of 3:3'-dibromosalicyl had been supplied to Professor Stickl by Prof. R. Kuhn of Heidelberg. The toxicity and chemotherapeutic activity of this substance against a fatal staphylococcal infection in mice had been investigated by one of Stickl's students (H. Cienger) in a doctor's dissertation. Whereas Kuhn claimed that 50 mg. daily, either by mouth or intraperitoneally, was tolerated by a 20 Gm. rat, Cienger found that a 20 Gm. mouse died almost immediately after administration of 5 mg. by intraperitoneal injection. Lower doses occasionally lengthened or saved the life of an infected mouse, but dibromosalicyl was less effective than Globucid. In the mouse it was three times as toxic as Globucid. Professor Stickl saw no future in this compound for staphylococcal infections. The

compound used in these tests was not dibromosalicil alone but the boric acid complex made for purposes of solubilization.

Professor Stickl's department has done no work on tetrachlorosalicil.

Biologic-Chemical Research Laboratory

The Biologisch-Chemisches Forschungslaboratorium, F. E. Freitag, director, is in two buildings in the village of Freudental, near Konstanz. It is a private institution with funds derived from several sources, namely (a) royalties on Freitag patents, (b) grants from the firm of Lomborg G.m.G.H., the holding company of Bykopharm, Frankfurt-on-main and (c) private contributions. The amount spent in 1944 was between 70,000 and 80,000 marks. Freitag had five qualified assistants and in addition about a dozen laboratory assistants. His present work is in the field of biologic chemistry. He claims to have evolved a purely physical, in vitro method for the measurement of anti-coagulant activity, using the gelling of a synthetic sol as an indicator. In attempts to find a satisfactory anticoagulant he examined the sulfuric acid esters of cellulose, chitin, denatured collagen and a carbohydrate fraction from *Chondrus crispus* (Iceland moss). No completely satisfactory substance has been found. He studied under Jorpes in Stockholm for three weeks in March 1944 and at present, with Dr. Frank of Neustadt in the Black Forest, he is trying to evaluate heparin in the prevention of thrombosis.

State Hygiene Institute

The State Hygiene Institute was badly damaged. Prof. K. Kisskalt, the director, explained the method that had been started in an attempt to avoid using agar with Petri dish cultures. Use was made of the sheets of filter paper soaked in bouillon stained with fuchsin, covered with a disk of cellophane and then sterilized. This method was used in the examination of fecal samples. Work had also been started with *Penicillium notatum* but had not got very far. They had a considerable number of cultures giving varying yields and had worked with a company named Mack in Illertissen.

MEXICO

(From Our Regular Correspondent)

Oct. 29, 1945.

Quackery, Tuberculosis and Newspapers

Recently some of the leading newspapers in Mexico City have given extensive publicity to two notorious nostrums for the treatment of tuberculosis. Mucelydina, the first one, is a supposed sodium salt of an acid which, it is said, is obtained from cultures of a fungus of the family of Mucedinaceae. The other so-called specific is called Diasone. It consists of plain ozone, which is applied to pleural cavities and it is claimed that with such a treatment all bacilli are almost instantly killed in a consumptive patient. In both cases the inventors are an engineer or a chemist without any knowledge of medicine, supported by a physician with unknown scientific background and sponsored by a newspaperman in charge of the propaganda. Up to the present time the authors have not revealed either the species of the fungus used to prepare Mucelydina or the chemical composition and method of preparation of the product and have not presented any evidence or data concerning experiments made in the laboratory; nor have scientific data on the preparation and the method of action of Diasone been revealed.

At the beginning Drs. Donato G. Alarcón, Ismael Cossio Villegas and Miguel Jiménez, well known specialists on tuberculosis, with the cooperation of the National Tuberculosis Association and some laboratory workers, made a study of the nostrums and reported that the experiments made in vitro, in animals and even in 30 patients were absolutely negative. The two alleged specifics did not change the status of the tuberculous

lesions either in laboratory animals or in human patients, and did not reduce either the number of bacilli in the sputum or have any influence on the temperature, the blood picture or the weight of the patients. On the contrary, it was found that Mucelydina caused congestion of the lesions in the lungs and hemoptysis. Similar studies made in the "Sanatorio Esperanza" in Havana, Cuba, confirmed these findings and Dr. Francisco Nuñez Llanes, director of the institution, stated in his report that ". . . we were unable to observe even the slight improvement obtained with the regular treatment of the ailment. . . ."

Second Mexican Congress on Social Sciences

On October 12 President Manuel Avila Camacho presided over the inauguration session of the second Mexican Congress on Social Sciences, organized by the Mexican Geographic and Statistical Society of Mexico (Sociedad Mexicana de Geografía y Estadística), which is one of the oldest on the continent. On the organizing committee were Señores J. Jesus Silva Herzog, undersecretary of public finances, Gilberto Loyo, economist and statistician, and Agustín Aragón, engineer, who acted as vice presidents, and Señores Jorge L. Tamayo, engineer, and Francisco de A. Benavides, lawyer, acting as secretaries.

The congress was organized in round table discussions and sessions of the different sections. Important and interesting sections were the ones on Sociology, Education, Social Medicine, Statistics, Anthropology and the round table discussions on "Human War Problems," "Natural Resources of Mexico," "Problems of Population," "Postwar Social Problems" and "Social Medicine," which were attended by large audiences.

Course on Tropical Dermatology

As announced in THE JOURNAL, a short course on tropical dermatology for North American physicians, which was organized at the special request of Dr. Howard Fox, New York, and Leon Goldman, Cincinnati, was conducted by the Dermatology Society of Mexico and the National Faculty of Medicine, with the cooperation of the Secretariat of Public Health and Welfare. The topics considered were Tropical Characteristics of Dermatology in Mexico, by Dr. Jesus González Urueña, Pinto Disease, by Dr. Salvador González Herrejón, Onchocerciasis, by Dr. Manuel Martínez Baez, Syphilis, by Dr. Julio Bejarano, Leprosy, by Dr. Eugenio Latapí, Mycosis, by Dr. Antonio González Ochoa, Leishmaniasis, by Dr. Jorge Millán Gutiérrez, and Lymphogranuloma venereum, by Dr. Oswaldo S. Arias. For each subject a syllabus was prepared and each lecture was followed by clinics or demonstration in the laboratory. The course lasted two weeks and was attended by fifty physicians, most of them North Americans, who also visited the special wards for dermatology patients in the city hospitals, the Institute of Health and Tropical Diseases, the School of Public Health and Hygiene, the National Leprosarium in Zoquepam, Mexico, the Lepers Clinic and the state of Guerrero, where the pinto disease prevails in certain zones. A certificate was given all students who attended the sessions regularly.

Marriages

FRANKLIN HENRY ELLIS JR., Princeton, N. J., to Lieut. Elizabeth Dunston Watson of Great Neck, L. I., November 17.

WILLIAM TOWNSEND DAVISON, Durham, N. C., to Miss Mildred McCarthy of Fairhaven, Mass., November 14.

EDWARD B. BENEDICT to Dr. Patricia Hatfield Smith, both of Boston, in Old Greenwich, Conn., October 2.

ROBERT HUGH DION, Glendive, Mont., to Miss Mary Kathleen Cleckley of North Augusta, S. C., June 24.

OLIN A. DIVELY, Blandinsville, Ill., to Mrs. Mary Kathryn James of Macomb in October.

Deaths

Benjamin Warren Black ☉ Oakland, Calif.; Medico-Chirurgical College of Philadelphia, 1916; fellow of the American College of Hospital Administrators, of which he had been vice president, American College of Physicians and the American Psychiatric Association; member of the American Association for the Advancement of Science, Association of Military Surgeons of the United States, California Academy of Medicine and the American Hospital Association, of which he had been president and trustee; served as regimental surgeon with rank of major with 157th Infantry during World War I; lieutenant colonel, medical reserve corps, U. S. Army, not on active duty; held a commission in the reserve corps of the U. S. Public Health Service from 1920 to 1924; executive officer of the U. S. Veterans Bureau from 1924 to 1926 and medical director from 1926 to 1928; administrator of the Alameda County hospitals; died December 1, aged 58, of nephritis.

Raymond Edward Watkins ☉ Portland, Ore.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1909; professor and head of the department of obstetrics and gynecology at the University of Oregon Medical School; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; member of the Pacific Coast Society of Obstetrics and Gynecology, of which he had served as president, Portland Academy of Medicine, the American Gynecological Society, International College of Surgeons and the Pacific Coast Surgical Association; past president of the Portland Society of Obstetrics and Gynecology; served during World War I; on the editorial board of the *Western Journal of Surgery, Obstetrics and Gynecology*; chief of the gynecologic and obstetric service at the Multnomah County Hospital; on the attending staff of the Emmanuel Hospital, where he died August 7, aged 63, of septicemia.

Hugh Carter Henry ☉ Richmond, Va.; Medical College of Virginia, Richmond, 1896; specialist certified by the American Board of Psychiatry and Neurology, Inc.; commissioner of the state department of mental hygiene and hospitals, a newly created position provided in the state government reorganization act, effective July 1, 1942; formerly assistant physician at the Central State Hospital in Petersburg, where he had been superintendent for many years; served as director of state hospitals since July 1, 1938, when the post was created; member of the Virginia Neuropsychiatric Society, of which he served as president, Southern Psychiatric Association, American Psychiatric Association and the Tri-State Medical Association; died October 14, aged 69, of carcinoma of the mediastinum.

Roger C. Swint ☉ Atlanta, Ga.; University of Georgia Medical Department, Augusta, 1898; an Affiliate Fellow of the American Medical Association; past president of the Baldwin County Medical Society and the Tenth District Medical Society; member of the American Psychiatric Association, serving as a member of the council; formerly assistant physician and clinical director of the Milledgeville (Ga.) State Hospital, where he had been superintendent from 1923 to 1935, when he resigned; as a token of the respect the hospital and community held for him, the principal road leading to the hospital grounds is known as Swint Avenue; consulting psychiatrist at the Veterans Administration Facility; died August 8, aged 69, of coronary occlusion.

Albert Dalbey Frost ☉ Columbus, Ohio; University of Pittsburgh School of Medicine, 1919; professor and since 1929 head of the department of ophthalmology at the Ohio State University College of Medicine; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Oto-Laryngology, American Ophthalmological Society and the Association for Research in Ophthalmology, Inc.; on the staffs of the University, Children's, Grant, Mount Carmel and White Cross hospitals; served as president of the Ohio Commission for the Blind; died near Monterey, Va., November 15, aged 56, of injuries received in an automobile accident.

Francis Fenwick Young ☉ Covington, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1884; member of the Sixth District Medical Society, Southern Medical Society, Louisiana Hospital Association, American Hospital Association and the National Association of Private Psychiatric Hospitals; first vice president and member of the board of directors of the Commercial Bank and Trust Company of Covington; founder, director and psychiatrist in chief of the Fenwick Sanitarium, first located in Abbeville and from 1912 in Covington; died September 26, aged 82, of cardiovascular renal disease and undulant fever.

James T. M. Allan ☉ Los Angeles; University of Southern California College of Medicine, Los Angeles, 1903; on the staff of the California Hospital, where he died August 25, aged 75, of subacute bacterial endocarditis.

Nim Lou Barker, Broken Bow, Okla.; University of Arkansas School of Medicine, Little Rock, 1915; member of the American Medical Association; served during World War I; medical examiner for the Selective Service; died August 19, aged 60, of coronary occlusion.

Edward Hooker Baxter, Boston; University of Vermont College of Medicine, Burlington, 1882; member of the American Medical Association; died July 30, aged 93, of coronary sclerosis.

Nicholas William Bonelli, Baltimore; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1928; member of the American Medical Association; served as police surgeon; died in the West Baltimore General Hospital August 14, aged 43, of meningococcemia.

William Celsor, Hartsville, Tenn.; Eclectic Medical Institute, Cincinnati, 1884; died August 25, aged 85.

Ira D. Clark, Fargo, N. D.; Chicago Homeopathic Medical College, 1895; served on the staff of the Grafton (N. D.) State School; formerly member of the school board; died July 23, aged 76, of coronary heart disease.

Jeremiah Joseph Donohue, Worcester, Mass.; College of Physicians and Surgeons, Baltimore, 1907; formerly city physician; served one term as a member of the school committee; died in Princeton August 4, aged 72, of chronic diffuse myocarditis.

Shepherd Drain, Baltimore; Maryland Medical College, Baltimore, 1906; Southern Homeopathic Medical College, Baltimore, 1907; member of the American Medical Association; died August 6, aged 68, of carcinoma of the bowel.

Mortimer Sharpe Faulkner, East Orange, N. J.; University of Oklahoma School of Medicine, Oklahoma City, 1942; served an internship, a residency and was a member of the staff of the Orange Memorial Hospital in Orange, where he died August 8, aged 31, of angioblastoma.

Lewis Michael Fox, Asheboro, N. C. (licensed in North Carolina in 1885); died in the Barnes-Griffin Clinic August 21, aged 86, of pneumonia.

Albrecht Eugene Fuld ☉ Port Washington, N. Y.; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany, 1932; specialist certified by the American Board of Radiology, Inc.; interned at the Auburn City Hospital in Auburn; served a residency at the Montefiore Hospital for Chronic Diseases in New York and the Methodist Hospital in Brooklyn; died July 3, aged 37.

John W. Groff ☉ Philadelphia; Jefferson Medical College of Philadelphia, 1888; past president of the Montgomery County Medical Society; died August 6, aged 81, of cerebral arteriosclerosis.

Nelson Kingsley Hopkins ☉ Arlington, S. D.; Northwestern University Medical School, Chicago, 1907; served as president of the South Dakota State Medical Association, of which he had been an honorary member; died July 25, aged 63.

Jackson Cleveland Loveless, Grayson, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1913; member of the American Medical Association; died in Atlanta August 4, aged 55.

Horatic Devol Luse, Cuernavaca, Morelos, Mexico; the Hahnemann Medical College and Hospital, Chicago, 1911; formerly affiliated with the U. S. Public Health Service Reserve and various Veterans Administration facilities; died July 22, aged 71.

Francis Henry McCaffrey, Providence, R. I.; St. Louis University School of Medicine, 1940; member of the American Medical Association; diplomate of the National Board of Medical Examiners; served a residency in anesthesia at the Lahey Clinic in Boston; on the staffs of the Homeopathic and Charles V. Chapin hospitals; on the staff of St. Joseph's Hospital, where he had interned and where he died July 21, aged 32.

Earnest Otis McCleary, Ordway, Colo.; State University of Iowa College of Homeopathic Medicine, Iowa City, 1909; served as county coroner, city health officer and county physician; died in the Mennonite Hospital and Sanitarium, La Junta, August 18, aged 60, of acute myocarditis.

James B. McWilliams, Ada, Ohio; University of Louisville (Ky.) Medical Department, 1884; died July 24, aged 84, of cerebral hemorrhage.

David McDill Morrison, Denver; College of Physicians and Surgeons, Chicago, 1884; died July 17, aged 91.

William Henry Musgrove @ Wheeling, Mo.; Marion-Sims College of Medicine, St. Louis, 1899; died in Eversonville August 22, aged 74, of cerebral thrombosis.

Ernst Valentine Neumann @ Los Angeles; John A. Creighton Medical College, Omaha, 1913; on the staffs of the Queen of Angels, Cedars of Lebanon and the Presbyterian Hospital-Olmsted Memorial, where he died August 14, aged 65, of pulmonary embolism.

Charles Henry Patterson, Fargo, N. D.; Minneapolis College of Physicians and Surgeons, the medical department of Hamline University, 1908; affiliated with the Veterans Administration Facility, where he died August 8, aged 60, of coronary arteriosclerosis.

Edward Herman Pond, Pittsburgh; University of Michigan Homeopathic School, Ann Arbor, 1886; died in the Shady-side Hospital July 7, aged 83, of nephrosclerosis and rheumatoid arthritis.

Luke William Price, Graham, Texas; Memphis (Tenn.) Hospital Medical College, 1894; past president of the Young-Jack-Archer Counties Medical Society; served as city and county health officer; worked with the Selective Service Board of Young County during World War II; on the staff of the Graham Hospital; died July 28, aged 71, of arteriosclerosis.

Mabel E. Rouse, Spring House, Pa.; College of Medicine and Surgery (Physio-Medical), Chicago, 1902; died August 31, aged 67, of coronary occlusion.

Hester Beck Searle, Denver; University of Colorado School of Medicine, Denver, 1930; member of the American Medical Association; interned at the George Washington University Hospital in Washington, D. C.; served on the teaching staffs of the Denver General and the Presbyterian hospitals in Denver; died in the Bellevue Hospital, New York, August 5, aged 38, of acute toxic hepatitis.

Robert Sidney Sloan, Columbus, Ohio; Ohio State University College of Medicine, Columbus, 1921; served as assistant physician at the Ohio Penitentiary; died in the Mount Carmel Hospital August 30, aged 49, of diabetes mellitus and nephrosclerosis.

Joseph Allen Smith @ Minot, N. D.; George Washington University School of Medicine, Washington, D. C., 1907; on the staff of the Trinity Hospital; died August 13, aged 61, of coronary thrombosis.

B. C. H. Spencer, Rochester, Mich.; Michigan College of Medicine, Detroit, 1881; formerly mayor of the village and member of the board of education; died August 25, aged 85, of cerebral thrombosis.

Joseph McArthur Spinks, Oak Hill, W. Va.; College of Physicians and Surgeons, Baltimore, 1912; died in the Massachusetts General Hospital, Boston, August 17, aged 58, of epidermoid carcinoma of the esophagus.

Millard F. Stever, Thompsonville, Mich. (licensed in Michigan in 1900); died August 7, aged 88, of heart disease.

LIEUT. COL. DWIGHT MEYER DETER
M. C., A. U. S., 1903-1944

CAPT. JOHN WISTER HAINES
M. C., A. U. S., 1912-1944

MAJOR JAY EUGENE TREMAINE
M. C., A. U. S., 1902-1944

Helen Jean Baird Schneider, Detroit; University of California Medical School, San Francisco, 1943; interned at the University of California Hospital in San Francisco; resident at the Henry Ford Hospital; died August 23, in Strathly, District of Nipissing, Ont., Canada, aged 28, from drowning.

Clarke Enoch Stewart, Vincennes, Ind.; Kentucky School of Medicine, Louisville, 1897; member of the American Medical Association; served during World War I; on the staff of the Good Samaritan Hospital, where he died August 8, aged 69, of injuries received in an automobile accident last Christmas eve.

KILLED IN ACTION

Dwight Meyer Deter, Austin, Texas; Baylor University College of Medicine, Dallas, 1929; served as resident physician at the North Louisiana Sanitarium in Shreveport; entered the medical reserve corps of the U. S. Army as a first lieutenant on July 16, 1929; began active duty as a captain on Dec. 1, 1939; promoted to major and lieutenant colonel; died in South China Sea Oct. 24, 1944, aged 41, while on board a Japanese prison ship which was sunk.

John Wister Haines, Philadelphia; State University of Iowa College of Medicine, Iowa City, 1937; interned and served a residency at the University Hospitals in Cleveland; served a residency at the City Hospital in Cleveland; entered the medical reserve corps of the U. S. Army

as a first lieutenant on June 7, 1937; began active duty in the same grade on Nov. 23, 1940; promoted to captain; died in the South China Sea Oct. 24, 1944, aged 32, while on board a Japanese prison ship which was sunk.

Jay Eugene Tremaine, Palos Verdes Estates, Calif.; Rush Medical College, Chicago, 1930; interned and served as resident physician at St. Luke's Hospital in Chicago; began active duty as a first lieutenant in the medical reserve corps of the U. S. Army on April 3, 1941; later promoted to captain and major in the medical corps, Army of the United States; awarded the Bronze Star posthumously; died in Mindanao, P. I., Sept. 7, 1944, aged 41, while on board a Japanese prison ship which was sunk.

Ira Farwell Thompson ☉ Donnellson, Iowa; Keokuk Medical College, College of Physicians and Surgeons, 1902; member of the American Medical Association; died in Mount Pleasant August 1, aged 71, of thrombosis of the cerebral artery.

Albert R. Touvelle, Firth, Neb.; Medical College of Ohio, Cincinnati, 1882; died in Lincoln August 21, aged 88, of hypostatic pneumonia.

Friend Wilford Trader ☉ Columbiana, Ohio; University of Pittsburgh School of Medicine, 1923; president of the school board; on the staff of the Salem City Hospital, Salem; medical examiner for the Equitable Life Insurance Company; died August 30, aged 47, of coronary occlusion.

James Wilson Wallace ☉ Aledo, Ill.; Northwestern University Medical School, Chicago, 1906; died in the Moline (Ill.) Public Hospital August 26, aged 64, of a skull fracture received in a fall.

Joseph H. Wallis, Rice Lake, Wis.; Milwaukee Medical College, 1898; served as mayor of Rice Lake, Wis.; for many years connected with the Trinity Hospital in Milwaukee; at one time a captain in the medical corps of the state and the national guard; died in a hospital at St. Paul July 23, aged 71, of heart disease and bronchopneumonia.

John Thomas Ward, Providence, R. I.; Harvard Medical School, Boston, 1900; visiting physician at the St. Joseph's Hospital; died in the Lovell General Hospital, Fort Devens, Mass., July 21, aged 71, of coronary thrombosis.

Hospital; courtesy surgeon, Flower and Fifth Avenue Hospitals; died in the Le Roy Sanitarium August 17, aged 69.

Elizabeth Fahnstock Lewis Whitaker, Anaheim, Calif.; New York Medical College and Hospital for Women, Homeopathic, New York, 1891; died in the Newhall Community Hospital, Newhall, July 30, aged 76.

William Preston White ☉ Henderson, Texas; Jefferson Medical College of Philadelphia, 1886; past president and secretary of the Rusk County Medical Society; president of the First National Bank and the Federal Savings and Loan Association; died July 3, aged 81, of heart disease.

Henry Charles Whiting, Fairfield, Iowa; Chicago Medical College, 1888; formerly a medical missionary in Korea; died August 18, aged 80, of mesenteric thrombosis.

Richard Edward Wilder, Whitefield, N. H.; Bellevue Hospital Medical College, New York, 1894; member of the American Medical Association; councilor and past president of the Coos County Medical Society; for many years medical referee for Coos County; member of the draft board during World War I; served several terms on the local school committee; on the staff of the Morrison Hospital, where he died August 24, aged 75.

Ernest Everett Wilson, Berkeley, Calif.; College of Physicians and Surgeons of San Francisco, 1906; served in France during World War I; died recently, aged 62.

Charles Luther Wood, Lakewood, Ohio; University of Wooster Medical Department, Cleveland, 1898; a member of

CAPT. DONALD L. WHITEHOUSE
M. C., A. U. S., 1915-1945

MAJOR ALBERT NOEL TOUSIGNANT
M. C., A. U. S., 1900-1944

CAPT. JOHN ROBERT PEPIN
M. C., A. U. S., 1916-1944

James Watt ☉ New York; Long Island College Hospital, Brooklyn, 1900; fellow of the American College of Surgeons; medical director for the New York offices of the Union Carbide & Carbon Corporation and the General Foods Corporation; served in France during World War I; surgeon to the Midtown

the staff of the Lakewood Hospital, where he died July 19, aged 74.

John G. Wynns, Sturgis, Ky.; Hospital College of Medicine, Louisville, 1903; also a dentist; served as a member of the school board; died August 18, aged 68, of heart disease.

KILLED IN ACTION

Donald Lynwood Whitehouse, Wakefield, Mass.; Tufts College Medical School, Boston, 1941; diplomate of the National Board of Medical Examiners; interned at the Lawrence General Hospital in Lawrence, Mass.; began active duty as a first lieutenant in the medical corps, Army of the United States, on July 1, 1942; promoted to captain; awarded a presidential citation and the Purple Heart; killed in action on Luzon, P. I., February 13, aged 29.

Albert Noel Tousignant, Oconto, Wis.; Marquette University School of Medicine, Milwaukee, 1925; member of the American Medical Association; interned at the Marquette University Hospital in Milwaukee; for four years held the position of medical director of the Civil Conservation Corps camps in Wisconsin and upper Michigan; entered the medical reserve corps of the U. S. Army

as a first lieutenant on Jan. 28, 1925; began active duty as a captain on March 17, 1941; stationed in the Philippines as chief surgeon of the Sternberg Hospital, Manila; after the fall of Bataan and Corregidor, was listed as missing; promoted to major in the medical corps, Army of the United States; died in the South China Sea Oct. 24, 1944, aged 43, while on board a Japanese prison ship which was sunk.

John Robert Pepin, E-canaba, Mich.; University of Michigan School of Medicine, Ann Arbor, 1941; interned at the Columbia Hospital in Milwaukee; began active duty as a first lieutenant in the medical corps, Army of the United States, on Oct. 12, 1942; promoted to captain on July 20, 1943; killed in action in the European area Aug. 9, 1944, aged 27.

Correspondence

"WHY TRADENAMES FOR ANTIBIOTICS?"

To the Editor:—I wish to compliment you on the editorial comment "Why Tradenames for Antibiotics?" (*THE JOURNAL*, October 20). This could readily apply to many other phases of the pharmaceutical practices. We are obliged to phone the druggist taking the proper name of many preparations before prescribing. The rank and file of physicians, as I discover, are disgusted with this practice, and I believe we would gladly specify any firm that might put out its products under the name that would indicate the real composition and use. I doubt if we really fall for the trick of trade names by different houses. I for one would select a firm in which I have confidence and prescribe accordingly.

CHARLES A. COFFIN, M.D., Kewanee, Ill.

To the Editor:—May I take the liberty to say that your short editorial comment is but too justified. The trade names for the various barbituric acids and the vitamins are already a heavy burden to the memory of the physicians. Yesterday it cost me quite a time to find out which firm manufactures cevitic acid and whether the name was cevitic or cevitanic acid. There is no grammatical reason for one or the other way to write it. As I did not want to ask a drug store, I was compelled to look over quite a number of periodicals; finally I found out that it is manufactured by Abbott and is spelled cevitic acid (for ascorbic acid). It would be much simpler and easier in case physicians could prescribe Ascorbic Acid, Squibb, or Ascorbic Acid, Abbott, or whatever other product they would prefer. In the same way it would be much easier to prescribe Barbituric Acid, Roche (called Allonal), or Barbituric Acid, Abbott (instead of Nembutal), and so forth.

ROBERT KUHN, M.D., Athens, Ga.

Resident Physician, St. Mary's Hospital.

CREEPING ERUPTION

To the Editor:—We wish to add the feature of remote skin response to the allergic picture of cutaneous helminthiasis (larva migrans, or creeping eruption) recently delineated in *THE JOURNAL* (Wright, D. O., and Gold, E. M.: Loeffler's Syndrome Associated with Creeping Eruption [Cutaneous Helminthiasis], *THE JOURNAL*, August 11, p. 1082).

On September 20 one of us (H. A. A.) noted a triple infestation of the sole of his right foot manifested by typical serpentine burrows of larva migrans. At the same time he became aware of pruritic skin lesions which successively but meagerly invaded various parts of his torso before appearing profusely on the inner aspect of each thigh about twenty-four hours later. The eruption consisted of discrete, dull erythematous plaques measuring about a centimeter in diameter. The itch was mild. As each lesion receded, its surface became somewhat crinkled. An occasional plaque then seemed to contain a superficial pinhead of clear fluid, which absorbed readily. None ruptured. All remote skin manifestations disappeared gradually during the next two and a half weeks and were gone a day or two before it was decided that the last of the culprit dog hookworm larvae had ceased its peregrinations and had apparently given up the ghost.

Laboratory studies were not feasible, owing to the stand-by status of this station.

We consider this rash to have been an allergic cutaneous manifestation of *Ancylostoma braziliense* infection.

HENRY A. ARKLESS, Captain, M. C., A. U. S.

JOSEPH H. HOLMES, Captain, M. C., A. U. S.

LUDWIG ASCHOFF

To the Editor:—A nephew of mine who is a lieutenant in the United States Army saw in a book shop in Italy a book by Aschoff published in 1940 in Nazi Germany. The title of the book is "Rudolf Virchow: Wissenschaft und Weltgeltung," published by Hoffmann und Campe, Hamburg. In the beginning chapters of this book Aschoff writes in a way that enabled the book to pass the censorship. He states that he will deal only with the scientist Virchow, not with the politician, with whose views he disagrees. In later chapters, however, which generally are not read by a censor, Aschoff deals freely with Virchow's liberalism. I have known Aschoff personally and I have heard him talk in political meetings and have always considered him liberal. When I last visited him (around 1930) I was impressed by his liberal views and by his interest in American ideas and institutions.

The book "Rudolf Virchow: Wissenschaft und Weltgeltung" (Hamburg, Hoffmann und Campe, 1940, 95 pages) by Ludwig Aschoff is a curiosity in the history of medicine and of bibliography. Brought out in 1940, during World War II, by the publishing house that once printed Heinrich Heine's poems, it forms part of a series called "Spiritual Europe" (naturally under Nazi censorship). The keynote of the series is Franco-German understanding in science, philosophy, music and art. The aim and the failure of the undertaking do not concern us. Pathologists, however, are interested in a book on Virchow, the master pathologist and great liberal, written by Aschoff, a great pathologist about whose political attitude opinions have differed during his lifetime as well as afterward.

The reader will be surprised by an array of quotations from Virchow's variegated writings. These, put together, form a neat little anti-Nazi catechism, which becomes even more concise and impressive by the use of italics:

"My patriotism . . . is not this dead love that arrogantly looks down on other people. . . ."

"By recognizing and honoring each other we shall become accustomed to fight with logic, not with weapons. . . ."

"Reconciliation . . . instead of hatred. . . ."

"The idea of a true and really all embracing humanity. . . ."

"Liberty to the largest extent. . . ."

"Science is human by nature, its form only is national" (reviewer's translation).

Aschoff does not even shrink from the taboo of race in writing about Virchow's anthropologic work, including the Jewish question; in this he cleverly camouflages himself by reporting a harmless controversy between Virchow and a Jewish writer. Through much of the book Aschoff lets Virchow have the floor and leaves the reader to form his own opinion and to guess that of the writer, as for instance in the ticklish question of naturopathy, which was looked on with favor by the Nazi government. On occasion Aschoff must have chuckled while thinking of the censor: he gives a list of famous Germans who have written letters to Virchow, and the one letter he prints verbatim came from the author of Germany's most popular farmer stories. Aschoff knew that this man had been a Jew and he could safely assume that the censor did not.

The book is intended for lay people as well. Readers who are not familiar with the intricacies of medical and philosophic thinking between 1800 and 1850 may be misled by quotations and statements about Virchow's vitalistic ideas. These, however, are stimulating to the medical scientist when he considers the similarity between 1850 and today, namely the accumulation of many facts and the longing for synthesis. Virchow fulfilled this longing.

The book has a place in the history of pathology for Aschoff's sake as well as for Virchow's.

ALFRED PRATT, M.D., New York.

TREATMENT OF AGRANULOCYTOSIS

To the Editor:—The report on the need of penicillin in thiouracil induced agranulocytosis by Drs. H. H. Rothendler and M. G. Vorhaus in the November 10 issue of *THE JOURNAL* raises the question of the proper treatment of agranulocytosis.

A review of the literature shows the occurrence of agranulocytosis in 31 of 1,985 persons, who received thiouracil; 10 patients died. Agranulocytosis may occur at any period in the course of thiouracil treatment even when small maintenance doses are employed. Unfortunately it may occur suddenly and even one week after the withdrawal of the drug therapy as it does following the use of sulfonamides and oxophenarsine hydrochloride (mapharsen). Several of the cases listed, such as the one of Rothendler and Vorhaus, have signs and symptoms of angina with elevated temperature, yet the blood picture shows only a severe granulocytopenia. I have had agranulocytosis occur in 2 of 35 patients who were treated with thiouracil. Both recovered.

In the treatment of agranulocytosis the drug should be immediately stopped; if the patient is warned he can do so himself. Penicillin should be given prophylactically as well as therapeutically for infection in adequate dosage. Maintenance of nutrition is urged. It is important to avoid too much handling of the patient and to segregate him from people with colds or other infections. Therapeutic endeavors, particularly sternal punctures, are contraindicated. In 1 case in the literature a sternal abscess was found post mortem. Iodine should be given to the patient who has had thyrotoxicosis in order to sustain the improvement of the thyroid state and prevent the possibility of a thyroid crisis. I gave my patients, empirically, crude liver extract. I do not expect too much from pentnucleotide, bone marrow concentrate, pyridoxine or folic acid as a cure for agranulocytosis. Transfusions are useful only in supplying nutriment to the body. The white blood cells are not increased following transfusions alone. They are too dangerous to use, since transfusion reactions have contributed to the death of several patients. Agranulocytosis may persist for seven to eight days. After this period one is usually rewarded by the slow recovery of the patient if an infection is not penicillin resistant.

BERNARD SELIGMAN, M.D., Brooklyn.

HEAT DISEASE

To the Editor:—The article "Statistical Study of 265 Cases of Heat Disease" by Borden, Wadill and Grier (*THE JOURNAL*, August 25, p. 1200) was read with considerable interest. To those of us stationed in the southern part of Iran, where some of the highest known environmental temperatures have been recorded, the problem of heat disease has been of considerable importance. During this last summer we have encountered dry bulb shade temperatures up to 122 F. and humidity as high as 61 per cent.

The general principles of treatment as outlined in the article are sound. In the management of heat stroke, however, there is, in my opinion, a considerable misdirection of emphasis. Much attention is devoted to the "rapid restoration of circulating fluid volume"; the urgency of rapidly reducing the hyperthermia is inadequately stressed.

True heat stroke results from a breakdown of the central temperature regulating mechanism. In this condition I have encountered rectal temperatures of over 110 F. It is well known that irreparable brain damage can result from severe hyperthermia if it is permitted to persist for any length of time. I have seen 2 patients with heat stroke who were left with serious residual neuropsychiatric sequelae; 1 manifested definite mental impairment and the second was left with a hemiplegia

and motor aphasia. The primary consideration is rapid lowering of the body temperature to a safe level of about 102 F. The use of a water spray with electric fans, as described by the authors, is adequate for this purpose. After the temperature is lowered, these patients must be carefully watched, since the hyperthermia may recur.

The process of brain damage in severe heat stroke is rapid and every minute counts. Consequently I cannot agree when the authors state that "intermediary treatment in the hospital or field is discouraged." Medical aid men readily learn the danger of severe hyperthermia and the necessity of immediate treatment. Treatment directed toward lowering the body temperature can and should be started whenever the patient is found. It is often dangerous to transport these patients for some distance to a hospital during the heat of the day. Every dispensary in this area is equipped with a heat stroke room so that immediate treatment can be instituted.

In our cases of heat stroke, circulatory collapse has not been a significant factor. The pulse is full and bounding and the blood pressure maintained. The use of plasma would appear to serve no purpose. It is true that these patients have lost considerable body salt, and a slow intravenous drip of isotonic solution of sodium chloride appears to be of some value. The dangers of pulmonary edema must be considered.

While heat exhaustion and heat stroke often merge, it is extremely important to distinguish clearly the cases of severe hyperthermia. These are the patients in whom death or serious sequelae can be avoided by immediate treatment.

HERMAN R. NAYER, Captain, M. C., A. U. S.

USE OF SALICYLATES IN RHEUMATIC FEVER—MIXTURE OF ASPIRIN AND VITAMIN K UNWARRANTED

To the Editor:—Since Link and his associates demonstrated a hypoprothrombinemic effect of salicylates in rats using 12.5 per cent plasma, the clinical significance in man of this finding has been in question. Despite the fact that unequivocal reports of actual hemorrhagic complications developing during salicylate therapy are rare, *THE JOURNAL* saw fit to call attention to the potential dangers in an editorial (*Hazards in the Salicylate Treatment of Rheumatic Fever*, Feb. 24, 1945, p. 460).

A great opportunity to throw light on this question has arisen with the large number of rheumatic fever cases seen in the armed forces which have been treated with large doses of salicylates, reports of which are now appearing. With doses as large as 10 to 15 Gm. daily continued over long periods, salicylate levels as high as 30 to 60 mg. per hundred cubic centimeters have commonly been attained with some increase in prothrombin time but with no evidence of hemorrhage. Lieutenant Britt and his associates (*THE JOURNAL*, August 25, p. 1195) have recently reported their experience with treatment of 51 cases of rheumatic fever with salicylates in the Navy. They found slight elevation of prothrombin time but no evidence of hemorrhage.

Based on our experience at this hospital, Lieutenant Colonel Warren reported a series of 98 cases of rheumatic fever (Central Society for Clinical Research, Chicago, November 2) treated with 10 to 20 Gm. of salicylates daily with no evidence of hemorrhage. Major Coombs reported (American Federation for Clinical Research, Chicago, November 1) that rheumatic fever patients receiving 10 or more grams of salicylate show an increase in prothrombin time only up to 20 seconds (normal 14 seconds). This is not a dangerous disturbance, according to Quick. Coombs further pointed out that doses of 6 Gm. or less per day cause no disturbance of the prothrombin time.

Two recently printed items make this more than an academic problem and stimulated this communication. One was the pul-

lishing in *THE JOURNAL*, October 20, of an abstract of an uncritical article on the subject by Capt. Rudolf Singer (*Arch. Otolaryng.* 42:19 [July] 1945) which might be accepted for more than it is worth by readers not acquainted with the subject. Singer stated in essence that since post-tonsillectomy hemorrhages are more common in this country than in Europe, and aspirin is given more commonly postoperatively in this country than in Europe, the explanation must be the administration of salicylates. The flaws of such reasoning should be obvious to all.

The second was an announcement in the *Madison Wisconsin State Journal* of October 8 that a patent had been assigned to the Wisconsin Alumni Research Foundation for a combination of aspirin and synthetic vitamin K, which presumably would be put on the market for public exploitation on the basis that such a combination would be superior to plain aspirin.

It is my belief that the present evidence shows that while salicylates do cause a slight prolongation of the prothrombin time, this is not clinically significant in doses up to 150 grains (10 Gm.) daily and hence the routine addition of vitamin K to aspirin is unwarranted.

CHARLES S. HIGLEY, Lieutenant Colonel, M. C., A. U. S.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Libel: Letter by Attending Physician to Successor Regarding Treatment Given Patient Not Libelous.—The plaintiff operated a "beauty parlor" in Fort Worth, Tarrant County, Texas. Being required by a Texas statute to obtain a "health certificate" to continue in business, she submitted to an examination by the physician defendant in Fort Worth. He advised her that she was "diseased" and administered "three shots of bismuth and three shots of Neo" within the next three weeks. These injections "caused first an itching sensation and later pain and suffering." After the sixth injection her suffering became so intense that she refused further treatment and closed her business in Fort Worth. She then returned to her former home in Greenville, Hunt County, Texas. Her suffering increased in intensity. Her hands and feet became swollen, her skin peeled off and she was confined to her room for several months, all the result, so she claimed, of "an overdose of arsenic administered by the physician." Before leaving Fort Worth the patient had informed the physician of her plans and he advised her that the injections must be continued. In response to her inquiry as to what the injections were, he told her that he would write her physician in Greenville concerning his treatment and, acting apparently in response to his patient's request, he wrote the following letter to his patient:

September 25, 1942. . . . My dear Miss ———: We are giving you the following information so that you may pass it on to your doctor. We have given you, since September 1, three shots of bismuth and three shots of Neo. Very truly yours, ——— M.D.

The patient kept this letter in her possession until Oct. 26, 1942, when she handed it to her physician in Greenville. Apparently, though this fact is not made clear from the reported case, to justify at all the litigation that ensued, there must have been some variance in the diagnoses of the two physicians.

Subsequently the patient sued the physician defendant in Hunt County, alleging, as grounds for recovery of damages, (1) that the letter quoted was a libel in that its effect was to charge that she was suffering from and had been treated for a contagious or infectious disease and (2) that the physician had been grossly negligent in his diagnosis and treatment. The physician defended by pleading privilege, in effect, that the suit against him should have been instituted in Tarrant County, in which Fort Worth was located. The patient filed a controverting affidavit, alleging (1) that the libelous letter was published

in Hunt County, where she resided at the time of the accrual of the cause of action and (2) that in treating her the defendant committed a continuing trespass, having its inception in Tarrant County and its completion in Hunt County, in which she suffered her major injuries. The trial court overruled the physician's plea of privilege and he appealed to the court of civil appeals of Texas, which certified certain questions of law to the Supreme Court of Texas for determination.

Two of the certified questions of law were as follows:

Second. Was delivery by appellee [patient] to Dr. Kennedy [the Greenville physician] of the letter given her by the appellant for the purpose and under the circumstances mentioned, appellee knowing at the time its meaning and purpose, a publication by her of the alleged defamatory matter?

Third. Under the facts heretofore stated, did appellee's alleged cause of action for libel against the appellant, if a cause of action existed, accrue in Hunt County?

The effect of the filing by the physician of the plea of privilege, said the Supreme Court, and the controverting affidavit filed by the patient was to impose on the patient the burden of proving that a cause of action for libel in fact accrued in her favor. There is no libel unless there is a publication, for the gist of an action for libel is injury to the plaintiff's reputation. Under the facts, the controlling question, so far as the right of the patient to sue in Hunt County is concerned, is: Was there a publication by the patient of a libel? That the patient requested the physician to write a letter to be shown her Greenville physician and that she herself, after placing herself under the treatment of her physician in Greenville, showed him the letter is clear. Her claim for damages for libel is on the theory that the letter was defamatory, meaning by necessary implication and understood by any physician to mean that she was inclined and had a loathsome disease, and that the physician defendant had been treating her. The letter was written in response to her request so that her Greenville physician would know what treatment had been given. The patient, however, was free to make use of the letter or not to use it as she saw fit. There is no suggestion that the physician defendant misled her as to the meaning of the contents of the letter. We express no opinion as to questions other than that of publication and, in our opinion, if the publication of which the plaintiff complains was consented to, authorized, invited or procured by the plaintiff, she cannot recover for injuries sustained by reason of the publication. Therefore the answer to these two certified questions of law is as follows: The delivery of the letter by the patient to her Greenville physician for the purposes and under the circumstances shown in this case was the publication of the libelous matter, if any, by the patient, and not by the physician, and a cause of action for libel did not accrue in favor of the patient.

The final question of law certified to the Supreme Court was as follows:

Was the trespass complained of, that is, the alleged negligent diagnosis and treatment of appellee by the appellant causing her suffering and damages in both Tarrant and Hunt counties, a continuing trespass authorizing suit in either county within the meaning of subdivision 2, Article 1995? [Revised Civil Statutes, Texas, 1925.]

The section referred to in that question reads as follows:

A suit based upon a crime, offense or trespass may be brought in the county where such crime, offense or trespass was committed, or in the county where the defendant has his domicile.

The patient, said the Supreme Court, relying for venue in Hunt County on the provision of the statute just quoted, had the burden of pleading and proving that a trespass was in fact committed in Hunt County. As shown by the facts, however, all the treatments, the injection of drugs which were alleged to have caused injury to the patient, were administered by the physician in Tarrant County. The injuries from the treatments were first suffered in Tarrant County and after the patient had left that county and returned to Hunt County her suffering from the treatments in Tarrant County continued and increased in intensity. The patient contended that the physician, by the injection of drugs in her veins in Tarrant County, set in motion an agency which he knew would inflict physical injury many days in the future, that the agency thus set in motion inflicted serious injury on her in Hunt County, and that thus the physician by the agency adopted did commit a trespass in Hunt

County. In our opinion, answered the court, this claim confuses injury caused by the trespass with the trespass itself. The misfeasance or the wrongful act is the trespass. Trespass is defined in 2 Bouvier's Law Dictionary, Rawle's Third Revision, page 3316, as:

An unlawful act committed with violence, actual or implied, causing injury to the person, property, or relative rights of another.

Frequently the word "injury" is used in its secondary meaning as having reference to an act which damages, harms or hurts, but ordinarily and primarily the word means the damage or hurt done to or suffered by a person or thing. 21 Words and Phrases, Permanent Edition, pages 414-443. While it is true that an action for compensatory damages may not be maintained unless the trespass has caused injury, the trespass is the misfeasance or wrongful act, and the injury is the result of the trespass rather than a part of it. The statute under consideration uses the words "in the county where such crime, offense or trespass was committed." The physician's acts of which the patient complains were committed in Tarrant County. The resulting injuries were in part suffered in Hunt County. Previous decisions of this court support the conclusion that the wrongdoer's act is the gist of the trespass and hold that the word trespass as used in the statute under consideration here embraces only wrongful acts, wilfully or negligently committed, and not to mere omissions to do what should have been done. Furthermore, decisions of the court of criminal appeals of Texas as to the venue for prosecution of the crime of abortion are in point. The general venue statute which is applicable to that offense provides that the proper county for the prosecution of the offense is that "in which the offense was committed." Article 211, Code of Criminal Procedure. It has been held that if the means or medicine which procures the abortion is used or administered in one county and the abortion occurs in another county, venue lies in the first county. These decisions hold that, although the final consummation of the offense occurred in the second county, the sole cause of it was set in motion in the first county and that because the defendant put in operation a force in one county, which produced its results in another county, the accused is responsible in the forum in which he performed the acts which resulted in the abortion. *Moore v. State*, 37 Texas Cr. R. 552, 40 S. W. 287; *Humphries v. State*, 93 Texas Cr. 399, 248 S. W. 374.

As determinative of the last question of law certified the court referred to *Wiese v. Becker*, Texas Civ. App., 294 S. W. 991. There a physician was sued for injuries suffered by his patient as the result of the negligent setting and bandaging of a broken arm. The patient in that case by a controverting affidavit alleged that the physician negligently set and bandaged the arm in Washington County and directed his patient to return to her home in Austin County, where she suffered intense pain and where, by reason of the unskillful setting and bandaging of the arm, the bones became incorrectly set, some of the ligaments were severed by the bandage and the arm was turned and twisted, resulting in loss of use. There the court held that the suit could not be brought in Austin County because there were no allegations of an affirmative act constituting a trespass committed by the physician in that county, the allegations showing on the contrary that everything the defendant did took place, not in Austin County in which the suit was brought, but in Washington County. In answer to the contention that there was a continuing trespass the court said:

In order to constitute a "continuing trespass," begun in one county and concluded in another, there must be some affirmative act constituting a trespass committed in each county. The negligent or unskillful setting and bandaging of appellant's broken arm in Washington County, from which her injury subsequently resulted in Austin County, did not constitute a "trespass" in the latter county, as that term is used in our venue statute.

Accordingly, the court answered the last question certified to the effect that the trespass complained of by the patient was not a continuing trespass authorizing suit in either Tarrant or Hunt County but was a trespass committed in Tarrant County, in which jurisdiction the suit should have been brought.

The net effect of the answers given by the Supreme Court to the certified questions was to result in the dismissal of the patient's suit against the physician.—*Lyle v. Waddle*, 188 S. W. (2d) 770 (Texas, 1945).

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examination of the National Board of Medical Examiners and the Examining Board in Specialties were published in THE JOURNAL, Dec. 8, page 1045.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Mar. 19-21. Sec. Dr. B. F. Austid, 519 Dexter Ave., Montgomery 4.

ARIZONA: * Phoenix, Jan. 4-5. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.

CALIFORNIA: *Written*. Los Angeles, March 11-14. Sec., Dr. Frederick N. Scatena, 1020 N. St. Sacramento 14.

COLORADO: * Denver, Jan. 1-5. Final date for filing application is Dec. 17. Sec., Dr. J. B. Davis, 831 Republic Bldg., Denver.

DELAWARE: *Endorsement*. Dover, Dec. 19. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

IDaho: Boise, Jan. 15. Dir., Bureau of Occupational Licenses, Miss Agnes Barnhart, 355 State Capitol Bldg., Boise.

ILLINOIS: Chicago, Jan. 8-10. Supt. of Registration, Department of Registration & Education, Mr. Philip Harman, Springfield.

INDIANA: Indianapolis, April 25-27. Sec., Board of Medical Registration & Examination, Dr. W. C. Moore, 301 State House, Indianapolis 4.

KENTUCKY: Louisville, March 25-27. Sec., State Board of Health, Dr. Philip E. Blackerby, 620 S. Third St., Louisville 2.

MAINE: Jan. 23-25. Sec., Board of Registration of Medicine, Dr. A. P. Leighton, 192 State St., Portland.

MICHIGAN: * Detroit, March 26-28. Sec., Board of Registration in Medicine, Dr. J. E. McIntyre, 100 W. Allegan St., Lansing 8.

MONTANA: Helena, April 1-3. Sec., Dr. O. G. Klein, First National Bank Bldg., Helena.

NEVADA: Carson City, Feb. 4. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.

NEW JERSEY: Trenton, June 18-19. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

NEW MEXICO: * Santa Fe, April 8-9. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.

NEW YORK: Jan. 28-31. Sec., Dr. Jacob L. Lochner, Education Bldg., Albany.

NORTH CAROLINA: *Reciprocity*. Raleigh, Dec. 29. Final date for filing application is Dec. 19. Sec., Dr. Ivan Proctor, Raleigh.

NORTH DAKOTA: Grand Forks, Jan. 1. Sec., Dr. G. M. Williamson, 414 S. Third St., Grand Forks.

OHIO: *Endorsement*. Columbus, Jan. 8. *Examination*. Columbus, March 19-22. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, March 23. Sec., Dr. J. D. Osborn Jr., Frederick.

OREGON: * Jan. 23-26. Exec. Sec., Miss L. M. Conlee, 608 Failing Bldg., Portland 4.

PENNSYLVANIA: Harrisburg, January. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

RHODE ISLAND: * Providence, Jan. 3-4. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH DAKOTA: * Pierre, Jan. 15-16. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, Capitol Bldg., Pierre.

TENNESSEE: * Memphis, Dec. 19-21. Sec., Dr. H. W. Qualls, 130 Madison Ave., Memphis 3.

TEXAS: Austin, March 27-29. Sec., Dr. T. J. Crowe, 918-20 Texas Bank Bldg., Dallas 2.

VERMONT: Burlington, March or April 1946. Sec., Dr. F. J. Lawliss, Richford.

WASHINGTON: * Seattle, Jan. 14-16. Dir., Department of Licenses, Mr. Harry C. Huse, Olympia.

WEST VIRGINIA: Charleston, Jan. 7-9. Commissioner, Public Health Council, Dr. John E. Offner, State Capitol, Charleston 5.

WISCONSIN: * Madison, Jan. 8-10. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Cheyenne, Feb. 4. Sec., Dr. G. M. Anderson, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

IOWA: Des Moines, Jan. 8. Dir., Division of Licensure & Registration, Mr. H. W. Grefe, Capitol Bldg., Des Moines.

MICHIGAN: Ann Arbor and Detroit, Jan. 11-12. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

MINNESOTA: Minneapolis, Jan. 2-3. Sec., Dr. J. C. McKinley, 126 Millard Hall, University of Minnesota, Minneapolis 14.

NEBRASKA: Omaha, Jan. 8-9. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Bldg., Lincoln 9.

OKLAHOMA: Oklahoma City, Jan. 21. Sec., Dr. J. D. Osborn Jr., Frederick.

OREGON: Portland, March 2. Sec., Board of Higher Education, Mr. C. D. Byrne, University of Oregon, Eugene.

SOUTH DAKOTA: December. Sec., Dr. J. D. Alway, Aberdeen.

TENNESSEE: Memphis and Nashville, Dec. 17-18. Sec., Dr. O. W. Hyman, 274 Union Ave., Memphis.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Aminophylline and Papaverine Hydrochloride in Myocardial Infarction of Dog.—Mokotoff and Katz studied the size of the myocardial infarcts eight weeks after ligation of the left anterior descending coronary artery in untreated dogs and dogs treated during this period with either aminophylline or papaverine. They found that papaverine and aminophylline, when given for a period of eight weeks in amounts comparable to therapeutic and nontoxic doses in man, reduce the size of experimental myocardial infarcts in dogs. Papaverine is more effective than aminophylline in this respect. There is an anatomic increase in the size and number of anastomotic channels in infarcted hearts with occlusion of a main coronary artery as compared with normal hearts. This was demonstrated by injection technic. No difference in the stage of healing was seen microscopically between the treated and the untreated dogs at the end of eight weeks. The difference in infarct size between the treated and the untreated dogs was not associated with any anatomic difference in the postmortem demonstration of the extent of the anastomoses. The difference in infarct size was due to a larger caliber of these anastomotic channels during life in the drug-treated dogs because of coronary vasodilatation and probably also of a more rapid early development. In these two ways the marginal area of the ischemic region was rendered sufficiently less ischemic and did not become necrotic. The rationale of early vasodilator therapy in recent myocardial infarction has been demonstrated, and both aminophylline and papaverine, especially the latter, have been shown to be effective.

Tumor of Left Auricle Simulating Mitral Stenosis.—A woman aged 48 with a primary tumor of the heart was diagnosed as having mitral stenosis. The presenting signs and the electrocardiographic and x-ray studies confirmed this diagnosis. The atypical course during the last few days of life was explained on the basis of unusual complications. It is this atypical course that recently has been reemphasized as being most helpful in the diagnosis of heart tumor. When the heart was examined during necropsy, a soft but resilient tumor was found filling the entire left auricle. Field and her associates identify the tumor as a pedunculated myxoma attached to the interauricular septum. They say that all primary neoplasms of the heart are of mesoblastic origin, with fibroma, myxoma, sarcoma and rhabdomyoma predominating. Myxoma is the most common and the most debated type of cardiac tumor. Thorel believed that myxomas are merely degenerative forms of

organized thrombi. Ewing states that separation of myxomas from organized thrombi may be based on the highly mucinous character of the stroma and on the presence of orderly radiating blood vessels and elastic fibers. In the reported case the size of the tumor, the site of attachment, the absence of layer formation (as would be expected in a thrombus), the healthy state of the endocardium and the histologic structure all seem to indicate that the tumor represents a true neoplasm. The pathologic aspects suggest that the use of digitalis in this condition may have caused early death of the patient.

Penicillin Treatment of Neurosyphilis.—Rose and his associates treated at the Boston Psychopathic Hospital 106 patients with symptomatic neurosyphilis. The great majority of the patients received in addition to the penicillin either malaria or fever cabinet therapy in approximately half the amount generally accepted as sufficient. Penicillin was administered intramuscularly in doses of 50,000 Oxford units per injection for a total of sixty injections (3 million units). The time interval of injection was varied according to a plan designed to give the maximum information. Clinical and serologic results in 70 cases followed from four to twelve months revealed that of the 70 cases 28 were improved, 37 were unchanged, and 5 were worse. The greatest percentage of improvement was found among the 49 cases diagnosed as dementia paralytica. The most striking result was seen in 6 cases of primary optic atrophy, in 5 of which there may have been arrest of visual loss. Spinal fluid examinations revealed an immediate response of an elevation in cells and total protein in most of the previously untreated patients, followed by a general gradual reduction in cell count, total protein and, later, a decrease in the Wassermann titer. Comparison between the clinical and serologic results did not show definite correlation at this stage. Penicillin is an active and effective therapeutic agent for late neurosyphilis, but comparison with the serologic results shown by 30 patients treated by older methods indicates that there is no striking difference at this period of observation. The authors believe that the time has not arrived for the distribution of penicillin for general use in the treatment of neurosyphilis.

Malaria Therapy of Neurosyphilis.—Bruetsch states that the occurrence of an incidental case of malaria in an institution in which malaria therapy is practiced is not proof that the malaria infection was contracted from an inoculated patient. A critical review of the instances of malaria which have been reported as having their origin from therapeutic malaria leaves the impression that definite proof for this assertion is lacking in almost all cases. The theory that maintenance of malaria in the human host for prolonged periods by direct blood inoculation leads to "asexualization of the plasmodium" is not shared by most malarialogists. Bruetsch is of the opinion that unfavorable ecologic requirements furnish the explanation for the fact that accidental transmission through therapeutic malaria practically never occurs.

Prognosis of Syphilis.—From a critical review of the literature Schamberg concludes that syphilis does not adversely influence life expectancy except through the known lethal effects of its serious late manifestations, particularly those of the central nervous and cardiovascular systems. There is no evidence that syphilitic infection per se, or antisyphilitic treatment, predisposes to tuberculosis, pneumonia, nephritis or other non-syphilitic diseases. Increased mortality of syphilitic patients is caused in part by deaths due directly to syphilis, in part to the higher death rate in segments of the population which have a high syphilis prevalence. Adequate antisyphilitic treatment will in the majority of cases prevent the development of the late manifestations of syphilis. The attitude of life insurance companies toward the syphilitic applicant is at present grossly unjust. Two sound courses of procedure would appear to be open to the insurance companies: (a) Disregard syphilis

entirely. (b) Perform routine serologic tests for syphilis on every applicant for insurance. In those in whom positive or doubtful tests are discovered, death losses may be obviated by clinical and laboratory examination and by setting up criteria of adequate treatment. Applicants found to have adequately treated latent syphilis may be granted standard insurance with no extra premium, and the mortality in this group will be found to be a function of the mortality of the socioeconomic and occupational groups of which it is composed. On the basis of simple and well accepted clinical and laboratory procedures, the life insurance companies may insure at standard rates the majority of syphilitic persons applying for insurance, with no risk of increased death losses. Employers may safely hire syphilitic persons and obviate increased compensation costs through similar clinical evaluation of their employees.

Temporal Arteritis.—Vandivier and Ritchey's 4 patients with temporal arteritis were all women past 69, were of a linear, asthenic type, were all of fair complexion with blue eyes and white hair and all had moderate hypertension. The most prominent symptom was pain over the region of the temporal artery and scalp, which was made worse by mastication and lying down. There was a moderate low grade fever, weight loss, weakness, sweating and a protracted period of asthenia and various degrees of incapacitation. Vague, generalized joint pains and pain in the back were common symptoms during the protracted convalescence. Clinical studies failed to show significant changes except a moderate leukocytosis and hypochromic anemia. The onset of the illness of 1 patient suggested heart failure; she had been sitting up in a chair for two weeks because of the pain experienced on lying down and had developed severe edema of the extremities. This edema disappeared when she changed from a sitting to a reclining posture. The onset in 1 other patient was attributed to dentures. In a third patient the onset had occurred following a slight injury to the head. These patients were nonsmokers. There was no evidence that resection of the involved artery was of therapeutic

value. In fact, 2 of the 3 patients who had a biopsy with a section of artery removed complained more bitterly of pain following this resection than before. Neither did they improve more rapidly than the patient who did not have a section of the artery removed. Low oscillometric readings in 1 case and absence of pedal pulsations in another suggest the possibility that the disease may be a generalized involvement of vessels other than the temporal vessels.

Atopy to Simple Chemical Compounds.—Feinberg and Watrous report that a number of workers in a pharmaceutical factory experienced symptoms of asthma and hay fever on inhaling small amounts of the dust of two organic substances, chloramine-T and halazone. These workers became sensitized while working where these chemicals were manufactured or packaged. When removed from contact with the chemicals they were relieved of their symptoms. The exhaust of some of the dust into the outside air contaminated the air sufficiently so that most of the sensitized persons stationed in other buildings as far as 300 yards away experienced respiratory symptoms when the wind blew from the direction of the chloramine factory. The study of the first patient gave evidence that this was a specific allergic phenomenon. Asthma and rhinitis due to the inhalation of dust of the water disinfectants chloramine-T and halazone were observed in 14 workers. These simple chemical substances of low molecular weight have been shown to behave as true atogens by producing immediate whealing skin reactions by direct test and by passive transfer. This experience suggests that such simple chemicals may act as complete antigens, that simple chemical allergens, as yet of unidentified nature, may be present in food, drink and air and that chemical irritants hitherto regarded as acting in a nonspecific manner may, on reexamination, exhibit specific allergenic behavior.

Reactions to Antipneumococcus Rabbit Serum.—According to Swineford, untoward reactions to therapeutic injections of antipneumococcus serum vary in incidence and severity. Death follows about one in five hundred injections of serum. This study was begun with the idea that the phenomenon of reversed passive anaphylaxis would explain the anaphylactic reactions that follow antipneumococcus serum injections in patients who had negative cutaneous, conjunctival and intravenous reactions to the serum. Experiments on guinea pigs and rabbits and a tabulation of some antipneumococcus serum reactions in patients are presented to support this idea. In reversed passive anaphylaxis the subject is sensitized by the presence of antigen and is shocked, after an interval, by immune

serum—a reversal of the sequence in conventional passive anaphylaxis. One batch of serum was found to be highly toxic for guinea pigs, suggesting the possible role of toxic serum in the circulatory type of reaction. Attempts to separate the sensitizing or anaphylactic antibody from the therapeutic antibody by heating the serum were unsuccessful. The number and severity of circulatory and reversed passive-anaphylactic reactions to antipneumococcus rabbit serum might be lessened by intravenous tests for toxicity on guinea pigs before releasing serum for clinical use, by the uniform use of immune serum instead of or in conjunction with normal serum for cutaneous, conjunctival and intravenous tests for sensitivity and by a second intravenous test dose of perhaps 3 cc. of immune serum.

Fibrin Foam with Thrombin.—Bailey and his co-workers found that fibrin foam with thrombin is an effective absorbable hemostatic agent in the liver, peritoneal cavity, abdominal wall, kidney and lung. In each of these locations the absorption of the material is accompanied by only slight tissue reaction. Clinical appraisal of fibrin foam with thrombin as an absorbable hemostatic agent in general surgery has been carried out on 240 patients. It has proved effective in controlling oozing surfaces and venous bleeding under a wide variety of circumstances, including wounds in patients with hemophilia. The use of fibrin foam with thrombin should not replace the careful control of bleeding by means of careful dissection and adequate placing of sutures. It should be reserved for those situations in which an absorbable hemostatic agent is desirable to prevent the injuring of vital anatomic structures or to control oozing which is not easily stopped by conventional methods, as in the beds of tumors and the cut surface of parenchymatous organs.

Bacillus histolyticus in Accidental Wounds.—Hall found *Bacillus histolyticus* in 18 of approximately 2,500 civilian wounds. Only 1 of these resulted in death. There were 7 cases of compound fractures in which *B. histolyticus* was discovered. All but 1 of these patients survived, 2 without infection, 1 with trivial infection and 3 with serious infections. With one exception *B. histolyticus* appeared only in the cultures made from the debrided tissues. In 1 instance *B. histolyticus* persisted until the twenty-fifth day, at which time the leg was amputated. Of the 5 cases of lacerations from which *B. histolyticus* was recovered, 2 wounds healed without infection and 1 healed after a minor infection, while 2 healed after serious infection. *B. histolyticus* was demonstrated again only in the debrided tissues from these cases. In 2 of the 3 patients with gunshot wounds *B. histolyticus* was recovered only from the debrided tissues; in the third case it was also discovered later. In both patients with burns *B. histolyticus* was recovered from the debrided tissues but not later. The debrided tissues were minutely studied in these cases as a means of determining the potential pathogenic agents. Hall does not advocate such cultures routinely, since they have little relation to the subsequent development of infections if surgical treatment is instituted within a reasonable time. Hall regards the occurrence of *B. histolyticus* in wounds solely as an expression of its widespread occurrence in nature. If wounds are promptly and adequately debrided, it rarely persists. If gaseous gangrene develops, the peculiar lesions produced by this organism in pure infections are likely to be masked and overlooked. It may persist in a mixed infection for twenty-five to thirty-seven days without giving clinical indications of its presence.

Diphtheria Outbreak at Naval Training Center.—During two late summer months of 1944 an outbreak of diphtheria occurred in three companies of one camp at a large naval training center. Twenty-four patients and 16 carriers were admitted to the dispensary or hospital. Contacts in barracks and in sick-bay were responsible for the cases. The outbreak was complicated by a concurrent epidemic of streptococcal disease. The cases of diphtheria were mild to moderate in severity and were apparently caused by the intermedius type. No deaths or serious complications occurred. The majority of the men had positive Schick reactions. A history of previous immunization for diphtheria did not guarantee a negative Schick test or the prevention of clinical diphtheria. Three cases of diphtheria developed in men with known negative Schick tests. Rigorous isolation of the patients and affected companies prevented further spread of the infection.

Gastric Resection for Ulcer.—At Wangenstein's clinic bleeding ulcer appears to be a more serious problem than perforated ulcer. Operating on such patients before their condition becomes critical will diminish deaths from hemorrhage. Such operations are trying and should be undertaken only by those prepared to deal with the exigencies of a gastric resection under difficult circumstances. Even superficial gastric erosions may provoke serious or even fatal hemorrhage. Local impairment of blood flow to the stomach and duodenum renders the mucosa more susceptible to injury by the acid peptic digestive juice. Severe gastric hemorrhage has been observed in a patient with arterial thrombosis of the intramural gastric vessels. Gastrojejunal ulcer and gastrojejuno-colic fistula after gastric resection are traceable to defects in the initial operation. No recurrent ulcers have been observed in more than 300 patients who have undergone resections for duodenal or gastric ulcer.

Strabismus Treated Orthoptically.—Gillan presents an analysis of 100 cases in which the complete course of treatment was given in an orthoptic department. The main points on which information was sought were (1) the deviation present at the conclusion of treatment compared with that present at the beginning, whether without or with recourse to operation, and (2) the degree of binocular vision present at the conclusion of treatment compared with that existing at the beginning of treatment. The material for review consisted of 100 consecutive patients, 51 girls and 49 boys aged from 5 to 12 years, the average being 9 years. The deviations present were from 3 to 60 degrees. Of 63 patients treated by orthoptic means only, the eyes of 36 became straight or nearly straight and developed good stereoscopic vision. The conclusion is reached that an essential prerequisite to successful treatment by orthoptics only is the existence of simultaneous perception and fusion and a strabismus of not more than 25 degrees, preferably much less, viz. about 10 degrees. Of 37 patients receiving orthoptic treatment plus operation, the eyes of 23 became straight or nearly straight, and 17 developed good or fair stereoscopic vision. Good stereoscopic vision is an important factor in maintaining orthopsis even when operation has been performed. Of a control series of 50 patients who were under observation for an average of nine months and had no treatment except glasses, none developed orthopsis or stereoscopic vision. Analyzing the refractive findings in the 100 cases under review and the effects present as a result of wearing glasses at the beginning of treatment by orthopsis, the author says that only 3 were straightened with glasses and 25 showed reduction of the squint.

- *Domestic Midwifery and the Family Doctor. D. D. Logan and E. K. MacKenzie.—p. 94.

Use of Amphetamine Sulfate by Psychopaths.—Certain psychopaths can tolerate amphetamine (benzadrine) in enormous doses and benefit from the therapy, as opposed to normal persons, who are intolerant of high doses. Shorvon's patient, a man aged 35, complained of depression, insomnia and nervousness. There was a family history of psychopathy. The patient

had been a nail biter, had had periodic attacks of starving, was emetic up to the age of 12 and was not adapted at school. He was an unhappy reserved man with few friends, stubborn, anxious, highly strung; sensitive and easily depressed. In 1939 he had been a fire fighter and had gone through the London "blitzes" but had to "steel himself" to do so. At the time of admission he gave no indication that he had been taking amphetamine. Later he admitted that he had been taking large doses of amphetamine sulfate for over four years, the daily consumption being from twenty-five to thirty 5 mg. tablets for many months periodically. The only apparent withdrawal symptoms were increased restlessness and sleeplessness. There were no physical ill effects. After stopping the amphetamine the patient had great hunger, which confirms the fact that amphetamine reduces the appetite. Although the use of amphetamine was abruptly stopped when the patient entered the hospital, he made no request for it. Sleeplessness induced by amphetamine was well compensated by barbitals. This case and others reported in the literature convinced the author that there is no evidence of physiologic damage from amphetamine even in prolonged and massive dosage.

Erythema Nodosum and Tuberculosis.—Of 9 patients with erythema nodosum, 3 were contacts of known cases of pulmonary tuberculosis, and another gave a family history of tuberculosis. Two had been visitors in a tuberculous household, and 2 more had relatives suffering from chronic cough who refused to be examined. Only 2 gave no history of suggestive contact. All the children gave a positive tuberculin reaction. The tuberculous lesions encountered were pleural effusion, pulmonary tuberculosis, phlyctenular conjunctivitis with corneal ulcers, tuberculous cervical glands, enlarged or calcified hilar glands and a simple primary complex. No history of rheumatism was given by any of the patients. Gray thinks that every patient with erythema nodosum should be regarded as having been newly infected with tuberculosis, and therefore search should be made among family and friends for the source of infection. While nothing serious may develop, the occurrence of ill health and minor tuberculous lesions is frequent enough to warrant attendance at a tuberculosis dispensary in every instance.

Renal Syndrome Possibly Induced by Anoxia.—The syndrome discussed by Macgregor and his associates is a condition of impaired renal function, which usually develops in an acute illness. Oliguria or anuria is commonly the first sign. In patients who survive there is also a postanuric period of impaired renal function with nitrogen retention and often a copious unconcentrated urine. The postanuric period may last for several weeks, but eventually there is complete recovery. The reversible nature of the renal failure is the chief feature that distinguishes this syndrome from the other forms of nephritis. Certain of the features of the syndrome under consideration have been described by Fishberg under the title "larval" or "necrotizing" nephrosis or under the term "prerenal azotemia." Macgregor briefly described the syndrome in 1944 under the term "tubulovascular syndrome." The main features have been noted in widely differing conditions. The authors mention the anuria seen in blackwater fever, incompatible blood transfusion and the crush syndrome. Other conditions in which features of this renal syndrome have been observed are septic abortion, concealed accidental hemorrhage, cholera, yellow fever, Weil's disease, diabetes, war injuries and pernicious anemia. Three different causes have been suggested for this syndrome: mechanical blockage, a nephrotoxic effect and renal anoxia. The theory of mechanical

blockage does not account for the many similar cases of anuria in which pigment is absent, and it has now been abandoned. In weighing the last two hypotheses the wide distribution of the syndrome must be taken into consideration. The nephrotoxic theory demands that a wide variety of toxins, many of them hypothetical or at least unidentified, shall all produce syndromes which are similar in their clinical and pathologic appearances. The one common factor may be a temporary shortage of oxygen. The evidence available favors the hypothesis that renal anoxia plays a large part in producing this syndrome, in that it results in damage to the renal epithelium and consequent impairment of renal concentrating power. The oliguria and anuria that occur in many instances are probably the direct result of the disturbances of renal blood flow that follow peripheral circulatory failure. If this is correct the prevention of anuria in these conditions will then depend more on the support given to the circulation than on efforts to keep the urine alkaline. The authors suggest that "renal anoxia" is a suitable name for the syndrome.

Transfusion and the Anemic Heart.—Sharpey-Schafer studied the effects of transfusion on circulatory dynamics by means of cardiac catheterization, a method allowing serial measurement of the output of the heart and the pressure in the right auricle. The blood volume in severe anemia is reduced and the right auricular pressure, cardiac output and percentage utilization of available arterial oxygen are increased. Transfusion raises the right auricular pressure and in normal subjects increases cardiac output, but in severe anemia cardiac output may fall. Acute pulmonary edema follows in some cases and the blood pressure may rise. This falling cardiac output is similar to Starling's overloaded heart-lung preparation, in which increased venous filling pressure results in falling cardiac output. Whereas intravenous infusions of 2,000 cc. at rates up to 160 cc. per minute have no deleterious effect on the normal human heart, Sharpey-Schafer found that 500 cc. at more moderate rates may overload the anemic heart. The usual practice of small transfusions of concentrated corpuscles is correct, but even a pint may prove too much. Assessment of venous filling pressure, therefore, is of some importance when transfusions are given. Clinical observation of the neck veins will give such information and prevent many disasters. The propped-up position is probably the best for transfusing severely anemic patients, for in this posture the right auricular pressure is lower than in the supine position. Clinical signs may not always prove adequate, and the most difficult cases require full investigation if treatment is to be rational.

- Generalized Subcutaneous Emphysema in Laryngeal Diphtheria: Contribution to Its Pathogenesis. M. Janbon, J. Chaptal and J. Audréani.—p. 1.
Infectious Hepatonephritis and Nuclear Icterus. J. Boncomont.—p. 8.

Emphysema in Laryngeal Diphtheria.—Janbon and his co-workers report 2 cases of subcutaneous emphysema complicating diphtheria in 2 girls aged 8 and 10 years. Diphtheria bacilli were demonstrated in the pharynx. In the first case two injections of antidiphtheric serum (15,000 and 10,000 units) proved ineffective; a third injection of 70,000 units was given and a tube inserted. The tube became obstructed by a pseudomembrane and was immediately removed. The inspiratory obstruction was only partially reduced. Subcutaneous emphy-

sema of the neck and thorax was noted the next morning. It subsided slowly within the next six days. There was less respiratory embarrassment, but the presence of air in the mediastinum was suggested by the fact that several days passed before the dyspnea had disappeared. The presence of a pseudomembrane in the lumen of the bronchi may have caused the emphysema. This concept was supported by the observations in the second case. A single dose of antidiphtheric serum (35,000 units) was administered and within twelve hours the respiratory embarrassment was somewhat improved. A sudden fit of coughing caused a return of the inspiratory and expiratory dyspnea, and within half an hour a subcutaneous emphysema became manifest in the neck, the face, the eyelids and the upper part of the thorax. Tracheotomy was performed. During intubation a pseudomembrane 4 cm. long was expelled in the shape of a fibrinous cast of a bronchial duct with two branches. Respiratory function was restored, but the emphysema increased within the next twenty-four hours. The presence of air in the soft tissues was demonstrated by x-ray. There was also atelectasis and emphysema. The emphysema slowly disappeared in the course of a few days. Tracheotomy is the method of choice, since intubation removes only the laryngeal obstruction, while tracheotomy provides for the escape of air from the mediastinum as well.

Annales Pédiatriques, Basel

164:169-224 (April) 1945

- Dystonia Musculorum Progressiva (Torsion Dystonia). Cornelia de Lange.—p. 169.
Superior Mediastinal Pleurisy in Young Children. G. Hartmann-Stehelin.—p. 182.
Hemopericardium of Traumatic Origin Presenting Aspects of Pericarditic Cirrhosis. L. Wolff-Wiesinger.—p. 209.

Torsion Dystonia.—Cornelia de Lange made microscopic studies of the brain, the greater part of the spinal cord and the visceral organs of a Jewish man who died at 45 and in whom the disorder began at the age of 8. The diagnosis of dystonia musculorum progressiva was verified by competent neurologists. The corpus striatum proved practically normal, but different parts of the brain and the cord presented anomalies which doubtless had a degenerative "anlage." The author is of the opinion that in the idiopathic or degenerative cases of dystonia there exist no specific anatomic changes but that the disorder is the result of a disturbance in the dynamics of the brain, spinal cord, nerves and muscles. The basis of this disturbance might be a metabolic process which produces no changes that are microscopically demonstrable.

- Myxedema of Hypophysial Origin: Case. E. B. Del Castillo, N. Quirno, M. A. Gambin and J. Manzuoli.—p. 416.

Myxedema of Hypophysial Origin.—According to Castillo and his collaborators myxedema of hypophysial origin is a variety of Simmonds' disease in which the pituitary body, the thyroid, the adrenals and the gonads are atrophied. The predominant symptoms are those of thyroid insufficiency. The diagnosis is made in women on the presence of symptoms of thyroid, gonadal and adrenal insufficiency with atrophic vaginal mucosa, infantile uterus, loss of libido, bilateral atrophy of breasts and scanty or absent pubic and axillary hairs. Male patients are of the eunuchoid type with gonadal insufficiency. The arterial pressure is low. The intolerance of the patient to thyroid therapy confirms the diagnosis. The case reported by the authors is the eleventh in the literature. A woman aged 35 with myxedema and typical symptoms of the disease was given thyroid twice. In both instances the symptoms of hypothyroidism improved, but acute symptoms of adrenal insufficiency supervened and thyroid therapy had to be stopped. Patients with hypophysial myxedema may improve on daily administration of 0.05 Gm. of dried thyroid combined with serum gonadotropin treatment. Discontinuation of serum gonadotropin in the course of the treatment results in reappearance of the harmful effects of thyroid therapy. Thyroid therapy alone aggravates the adrenal insufficiency, while serum gonadotropin alone exerts no favorable effect on the clinical symptoms of myxedema.

Book Notices

Treatment in General Practice. By HARRY BECKMAN, M.D., Professor of Pharmacology, Marquette University School of Medicine, Milwaukee, Wisconsin. Fifth edition. Cloth. Price, \$10. Pp. 1,070. Philadelphia & London: W. B. Saunders Company, 1945.

When a medical book is in sufficient demand to pass into a fifth edition within fifteen years there must be reason for such popularity. There is no doubt that Beckman's *Treatment in General Practice* is widely used by the student, teacher and practitioner; nor is there any doubt concerning the usefulness of this volume and the wealth of information which it contains. Serving as a reference book and as a textbook, the work provides information on fluke infections, worm infections, allergic disturbances, deficiency diseases, endocrine disturbances, disturbances of menstruation, obesity and malnutrition, diseases of the gastrointestinal tract, diseases of the liver and bile passages, diseases of the respiratory tract, nephritis and nephrosis, disturbances caused by excessive heat, the anemias, blood disturbances other than the anemias, circulatory disturbances, eclampsia, hyperemesis gravidarum, genital urinary infections and stone, diseases of the lungs, diseases of geriatrics, diseases of the skin, acute poisoning, burns, shock, crush and blast syndromes, and toxic and other special features of sulfonamide therapy. The present edition includes for the first time entities from acute infections, lymphocytosis and airsickness to the Rh factor syndromes, toxoplasmosis and congenital syndrome.

Concerning the purpose of the book, no explanation is needed for those who are familiar with its contents. Others who are yet to be introduced may anticipate with much pleasure a collection of facts concerning the treatment of disease, a collection which is based on an extensive bibliography and tempered by the author's experience. The format and style of writing continue to be pleasant, the manner of treatment of the subject to the point and offered with a minimum of waste of words. Occasionally one wonders about the need for mentioning treatments which are admitted by the author to be of little or no value, for example the use of patulin for common colds, but perhaps some will argue that the practicing physician will frequently want such negative information if for no other reason than to refresh his memory and perhaps convince patients who urge him to "do the latest" on the basis of newspaper articles.

Compared with other books offered as a source of information on treatment in general practice, this book will continue to rank high in favor. It is the sort of volume that one likes to have conveniently close, as it will be used frequently and freely.

Key Groves' Synopsis of Surgery. Edited by Cecil P. G. Wakeley, C.B., D.Sc., F.R.C.S., Senior Surgeon to King's College Hospital, London. Twelfth edition. Cloth. Price, \$6. Pp. 632, with 208 illustrations. Baltimore: William Wood & Company, 1945.

As the title implies, this volume represents an outline of surgery, including practically all its specialties. Of necessity, the material is brief but is arranged in a very clear, concise manner because of skilful use of headings and subheadings. The illustrations are poorly executed and not too well chosen. Numerous errors in principles are found. Too much emphasis is placed on the use of heat in the treatment of burn shock. The use and value of tetanus toxoid is not mentioned. The amount of tetanus antitoxin (viz. 500 units) recommended in the prophylaxis of tetanus would be considered too small by most surgeons. The discussion on treatment of shock is not very modern. The same may be said of the treatment of peritonitis; too little attention is paid to the use of decompression. The advice to give "prostigmin (1 cc.) every hour for six hours" in the treatment of peritonitis would be strongly condemned by most surgeons. The recommendation to resort to "continuous saline infusion by rectum" is highly dangerous without specific warning about the use of too much salt. No mention is made of the use of intravenous glucose or amino acids in the treatment of peritonitis. In fairness to the volume it should be emphasized that an enormous amount of factual data is included, but so much important data including pathology and physiology are omitted that use of the book by students would appear misleading and even dangerous.

The Intervertebral Disc with Special Reference to Rupture of the Annulus Fibrosus with Herniation of the Nucleus Pulposus. By P. Kellie Bradford, M.D., and R. Glenn Spurling, M.D. Second edition. Fabrikoid. Price, \$1. Pp. 192, with 70 illustrations. Springfield, Illinois: Charles C. Thomas, Publisher, 1945.

After reviewing the second edition of this book, one is at a loss to understand the excuse for its publication, for with the exception of the chapter on cervical disks there is essentially no change. Readers have a right to expect that one who assumes to write a book is an authority. At least the book should be up to date. It is a volume of uncertainty and equivocation at a time when recent advances have completely transformed the field, both in diagnosis and in treatment, to one of accuracy and certainty. And they have stood the test of time. The diagnosis of defective disks is now so simple and free of error that contrast mediums in the spine are no longer indicated and should not be tolerated. Yet pages are devoted to their useless pictures. The diagnosis of defective disks by simple x-rays is pathognomonic in 75 per cent of the cases (by narrowing of one or more disks) and yet this simple interpretation is not recognized. The causes of failure of the operative treatment of disks—concealed disks, multiple disks and the operative removal of the entire disk—are now known and have been corrected and with vastly improved results, and yet these improvements, though well known to the writers, are ignored. The consideration of fusion operations, so frequently used as an adjunct to disk removals, is argued pro and con and without decision, despite the fact that it can be dogmatically stated that there are never reasons for fusions when disks are properly treated. Finally the authors lay great stress on the assumption that defective disks are confined to the nucleus pulposus when the mere inspection of one of the large sequesterums from protruding disks shows that it is largely fibrocartilage. And when nature cures a defective disk by absorption, the entire disk is absorbed—the operator's clue to successful treatment.

Textbook of Organic Chemistry. By K. Wertheim, Professor of Organic Chemistry in the University of Arkansas, Fayetteville, Ark. Second edition. Fabrikoid. Price, \$1. Pp. 867, with 113 illustrations. Philadelphia: Blakiston Company, 1945.

In the first edition the author made an admirable attempt to refer to the medical uses of various compounds throughout the book—in this edition he continues to do so. The reader must not expect detailed or elaborate discussions of medical applications of compounds; in many instances one or two sentences are considered sufficient. The general topics are presented in the manner conventional for organic chemistry. The opening section on aliphatic chemistry is followed by the section on aromatic chemistry, of which the last few chapters are devoted to quick summary reviews of subjects of more interest to the physician. The chapter on alkaloids carries a number of structural formulas; one short chapter is devoted to glycosides, enzymes, hormones and vitamins. There is even one chapter devoted to the topic chemistry of the human body, which has a short section of interest concerning the effects of the chemical groups in an organic molecule on physiologic action. Like other more recent textbooks of organic chemistry to appear on the market, two general trends are extended in this book. First, the improved format—the free use of pictures and structural formulas, and the author's style of presenting the topics—is conducive to relatively easy reading. Second, a fair share of the book is devoted to chapters concerned with the role of organic chemistry in the biologic and medical sciences. Of necessity these chapters are very brief summaries, but they are supplemented at the end of each chapter by exceptionally fine references to more detailed articles.

Beutley and Driver's Text-Book of Pharmaceutical Chemistry. Revised by John Edmund Driver, M.A., Ph.D., M.Sc. Fourth edition. Cloth. Price, \$7.50. Pp. 611, with 17 illustrations. New York, London & Toronto: Oxford University Press, 1945.

This textbook is composed of sections on analytical, inorganic and organic chemistry as they pertain to pharmacy and pharmaceutical chemistry. The book would probably be of value to technicians and students of pharmacy but the procedures outlined are based largely on those of the British Pharmacopoeia. As such, the book loses a great deal of its importance to the American worker. Even at a lower price, one would expect a more substantial binding.

Queries and Minor Notes

THE ANSWERS HEREFOR PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

PRACTICE OF ORTHOPTICS BY NONMEDICALLY TRAINED PERSONS

To the Editor:—In view of the spreading tendency to practice orthoptics by unqualified operators, please express an opinion about the practice in question. Specifically, I should like to know whether orthoptics is considered a branch of medicine or not and whether anybody could practice orthoptics of his own initiative (diagnosis of phorias or tropias and relative treatments) without committing an illegal act.

Arthur A. Gallo, M.D., Farmingdale, N. Y.

[This inquiry has been referred to two prominent ophthalmologists, whose respective replies follow.—EDITOR.]

ANSWER.—Orthoptics is defined as the treatment of ocular motor anomalies by remedial exercises. The technicians, "orthoptists," who administer this treatment are not licensed by the various states. However, the Committee on Motor Anomalies of the American Committee on Optics and Visual Physiology studied the problem of attempting to regulate the training and practice of orthoptic technicians. This committee recommended that an orthoptic council be formed composed of members of the three national societies—the American Academy of Ophthalmology, the Section on Ophthalmology of the American Medical Association and the American Ophthalmological Society. The American College of Surgeons was later added. The Council has been in operation since 1938 and discourages the practice of orthoptics except under the close supervision and direction of qualified ophthalmologists. Any one who claims to be able to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition and who shall either offer or undertake by any means or method to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition is practicing medicine. With this definition of the practice of medicine in mind, it is apparent that the practice of orthoptics must be considered as a part of the practice of medicine.

ANSWER.—Laws regulating the practice of medicine vary in different states. In general, stress is laid on the use of drugs, while the use of appliances such as spectacle or the use of manipulations or exercises or mental treatment or the like, which are so important a part of the practice of medicine, are deemed not to need regulation, probably because their dangers are not recognized. In some states (California, for example) diagnosis is deemed a part of the practice of medicine. Thus, a follower of Bates in Los Angeles, acting under expert legal advice, requires her patients to write down their own diagnosis. Then, as she does not use drugs and makes no diagnosis, she is, according to the law, not practicing medicine.

The problem is, on the one hand, to educate the public and the lawmakers to a better understanding of the scope of the practice of medicine and the indirect as well as the direct dangers of the practice of medicine by unqualified practitioners and, on the other hand, to include in the education of doctors of medicine a knowledge of the good features which undoubtedly underlie many of the irregular practices which arise from time to time, for example in orthoptics and allied fields of ophthalmology.

LEVELS OF EXCRETION OF HORMONES IN WOMEN

To the Editor:—Will you kindly inform me as to the changes in the gonadotropic and estrogenic hormones in the serum of pregnant women during pregnancy and following labor, and the levels of the gonadotropic and estrogenic hormones in normal nonpregnant women throughout the menstrual cycle? Have such studies been made of patients with mental derangements?

M.D., New York.

ANSWER.—Within a few days after the first missed period chorionic gonadotropins appear in the body fluids such as the urine and blood in increasing quantities, so that by two or three weeks after the first missed period there may be as much as several thousand rat units found in a twenty-four hour output of urine. This substance is found in the serum in concentrations of 2 to 10 rat units per cubic centimeter at about this time. After about sixty to ninety days there is a tremendous increase in concentration of gonadotropin, so that there may be as much as ten times the amount stated found in both urine and blood,

i. e. several hundred thousand units per twenty-four hour excretion of the urine or per liter of serum. This peak subsides and remains fairly constant at a level of from 3 to 10 thousand rat units per liter of serum or per twenty-four hour excretion of urine. Following delivery there is a disappearance from the body of the chorionic gonadotropin within four or five days, since the placenta is the site of formation.

The estrogens in the serum and urine of pregnant women increase gradually from the time of the first missed period and reach a peak before term at about 100,000 rat units excreted daily. This estrogen is in the form of estrone, estriol and estradiol, all of them being in the free state or combined with glycuronic acid. There is a change in the estrogen pattern, however, in the early months, at which time the estriol to estrogen ratio is 1 to 2 but at term 1 to 15, and also at this time there is a sudden rise in estradiol with the disappearance of the estrone. During abnormal states, such as toxemia, the relative amounts of chorionic gonadotropins and estrogens are altered with a relative increase in chorionic gonadotropins and a decrease in the estrogens. This alteration in ratio has been detected long before the symptoms of toxemia have appeared clinically (Smith, G. V., and Smith, O. W.: *J. Clin. Endocrinol.* 1:470 [June] 1941; Freed, S. G.: *Glandular Physiology and Therapy*, Chicago, A. M. A., 1941, chapter 22). The hormone excretions in the normal women are quite varied. There is, however, a fairly consistent pattern in estrogen and gonadotropin excretion. There is apparently a biphasic excretion curve of estrogen, a rise appearing at the midperiod and another before the menses, with a rapid drop at the time of flow. The actual range in values run from about 5 rat units per twenty-four hour excretion of urine to about 100 rat units if the urine is hydrolyzed so as to free the conjugated estrogens. The peak at midterm indicates, apparently, ovulation. The second pattern indicates corpus luteum activity. The gonadotropic levels in the normally menstruating woman are inconsistent and without any clearcut pattern, although there seems to be an increase in level at about the midterm coincidental with ovulation in many women. Some have formed an increase before the menstrual flow or at other times during the cycle. Usually there is an insufficient amount of gonadotropins in a twenty-four hour specimen of urine to assay biologically, and it is only at a peak that enough is present to be detected, highly concentrated urinary extracts being used for this purpose.

Assays of both estrogens and gonadotropins have been made in women with mental derangements, but a significant difference in the normally menstruating or pregnant psychopathic woman from that of the normal woman does not exist.

PENICILLIN PREPARATIONS

To the Editor:—I have been told that excellent results are obtained in syphilis using 1 cc. of Delacillin containing 300,000 units per cubic centimeter of penicillin calcium in peanut oil with beeswax. This is given intramuscularly daily until eight doses have been injected. I am skeptical of the claims made and would appreciate an opinion.

Gabriel E. Obester, M.D., Elizabeth, N. J.

To the Editor:—What is the present status of calcium-penicillin dissolved in beeswax peanut oil? A physician has informed me that several clinics have discarded its use as ineffectual because sufficient blood saturation could not be produced or maintained.

L. A. Sagnalla, M.D., Los Angeles.

To the Editor:—Is the penicillin used in arol and topical products stable? What precautions must be taken in the house of the patient in order to preserve the efficacy of the penicillin for several days?

M.D., Santiago De Chile.

ANSWER.—The use of Delacillin in the treatment of syphilis is still under investigation. The exact time and dose relationship has not been worked out in a sufficiently large number of cases to make valid any statements concerning the relative merits of this preparation in a dosage of 300,000 units per cubic centimeter for a period of eight days and the multiple injection technic with the sodium and calcium salt in isotonic solution of sodium chloride.

Penicillin suspended in beeswax and peanut oil is being used extensively; there seems to be no question that it is absorbed slowly from the muscles after injection. There has been some irregularity in the levels of penicillin observed in the blood following injection, depending on the technic of assay and the time interval for assay.

Penicillin manufactured for oral and topical use is stable within the expiration dates as published on the labels. The specifications published in *THE JOURNAL*, Aug. 18, 1945, page 1161, are those which have been set up and approved by the Food and Drug Administration of the Federal Security Agency.

TREATMENT FOLLOWING PENICILLIN FOR SYPHILIS

To the Editor:—I should like some information regarding follow-up therapy on those receiving penicillin for syphilis. Five patients with syphilis of duration greater than four years each received a total of 2,400,000 units of penicillin in sixty doses. Another patient of a duration of two years received the same amount, and an infant with congenital syphilis received 10,000 units every three hours for sixty injections. All were told to return at the end of three months for a repeat of the Wassermann test. The infant now has a negative reaction at the end of three months. At the end of the same time the patient who had the disease two years still has the same Wassermann reaction as before, 1 plus on the quantitative scale. One of those having the disease more than four years now has a Wassermann reaction of $\pm \pm \pm 000$ at the end of three months, but before the penicillin was started it was 2 plus. Two patients who had had syphilis for a duration of more than four years have remained stationary on the Wassermann report, and 1 has dropped 1 plus. The others have not yet reported for blood test. With the exception of the infant, all had received adequate treatment with arsenicals and bismuth compounds and had failed to respond with a negative Wassermann reaction. They were chosen for the penicillin therapy because of their failure to respond by the more conservative types of therapy. If the Wassermann reaction should show no reduction or be even more positive at the end of six months, what would be the procedure of choice? Should the penicillin be repeated alone or in combination with arsenicals or should one return to a yearly repetition of a course of arsenical and bismuth preparations? Would these patients be presumed to be Wassermann fast? If so, what would the procedure be then? If the Wassermann reaction should be reduced but still positive, what therapy should be instituted? If the Wassermann reaction is negative at the end of six months, what instructions about returning for periodic check-ups should be advised? One patient had a positive spinal fluid Wassermann reaction, as well as a paretic type of gold curve; if the fluid and blood should still be positive at the end of six months what course should be followed? What should be done if the fluid is negative and the blood positive?

M.D., Wisconsin.

ANSWER.—On the basis of the information given, the question seems to concern management following penicillin therapy of (1) 1 patient with infantile (early) congenital syphilis, (2) 1 patient with seropositive early latent syphilis (of two years' duration) who had received "adequate" chemotherapy prior to being given penicillin, (3) 1 patient with syphilis of the central nervous system and (4) 4 patients with seropositive late latent syphilis who had also received "adequate" standard chemotherapy prior to penicillin treatment.

1. In the infant with infantile congenital syphilis, the dosage of penicillin given could be considered to be adequate and the response of the blood serologic test normal. Subsequent medical follow-up should consist of a complete physical examination and blood serologic test every three months for the next year, with an examination of the spinal fluid once during this period. If the medical observations should remain normal, no additional treatment is indicated. If there should be any evidence of relapse, either clinical or laboratory, then treatment with double the initial dosage of penicillin could be considered.

2. There is insufficient information available as yet to be certain what can be expected from the treatment of early latent syphilis with penicillin because the initial clinical experimentation has concerned itself almost exclusively with symptomatic early and late syphilis in order to have definite clinical as well as laboratory measuring sticks to determine the effectiveness of the drug. It may be many months, or even several years, before definite procedures can be outlined for early latent syphilis. In a case like that described, a study of the spinal fluid, a complete cardiovascular evaluation and a general medical appraisal should be carried out to be certain that the persistently positive blood test is not the result of detectable activity. If it is, then strict individualization is necessary; if it is not, then, since the blood serologic titer is very low, clinical observation and a blood serologic test once every six months for the next three to five years could be carried through without additional therapy. If there should occur a persistent increase of the blood serologic reaction during this period of observation, retreatment could be considered, using either double the original dose of penicillin alone or standard arsenic and bismuth chemotherapy in addition to penicillin, or arsenic and bismuth alone, the choice being one purely of individual preference on the part of the physician.

3. The penicillin treatment of central nervous system syphilis is still much in the experimental stage, so that it is difficult to outline authoritative standard procedures. The clinical and laboratory (both blood tests and spinal fluid studies) response has been good in some cases but not in others. In general, the dosage used, namely 2.4 million Oxford units in seven and one-half days in the treatment of the case cited, would be considered to be on the low side. Many experts working in this field are now using total dosages of 8 to 10 million Oxford units of sodium penicillin in syphilis of the central nervous system. One group of workers in this field has demonstrated to their own satisfaction that maximum improvement (clinical and laboratory) following administration of penicillin in central

nervous system syphilis is reached in about four months after treatment. It is recommended, therefore, that retreatment with penicillin, when considered necessary because of failure of response to initial therapy, be given approximately 120 days after the first course. When larger dosages of penicillin are used in retreatment of such cases (4 to 8 million Oxford units) the period of treatment is likewise prolonged to not less than fifteen days. It cannot be stated at this time that penicillin has replaced other types of treatment (in particular fever therapy alone or chemotherapy in addition to fever therapy) in the treatment of central nervous system syphilis. The choice is one of individual medical preference. As in the past, in the care of patients with central nervous system syphilis a study of the spinal fluid should be repeated at six months intervals at least and the patient should remain under active medical supervision with the treatment individualized on the basis of response, rather than routinized.

4. The 4 other patients with seropositive late syphilis who have received adequate therapy with arsenic and bismuth would certainly fall in the category of Wassermann fast if each has a negative spinal fluid study and no clinical evidence of activity. Experience with penicillin treatment of such cases is likewise limited. Stokes et al. (Stokes, J. H.; Sternberg, T. H., and others: The Action of Penicillin in Late Syphilis, *THE JOURNAL*, Sept. 9, 1944, p. 73) report that, "irrespective of the system used, in all types of syphilis, penicillin causes reduction of syphilis rcagin titer in the blood in from 50 to 60 per cent of late cases." Stokes and Berman (Penicillin in Late Syphilis, *Am. J. Syph., Gonorr. & Ven. Dis.* 29:313 [May] 1945) later indicated that "in serologic fastness at moderate dosage penicillin is erratic and not notably effectual." Cases of this type are also cited in which an increase in syphilis rcagin has followed penicillin therapy. This has also been observed following other modes of chemotherapy.

Accordingly there is no real evidence to date that penicillin will cause a favorable response of the blood serologic test of Wassermann fast cases when other modes of chemotherapy, adequately tried, have failed. The medical handling of this type of case in the present state of our knowledge should continue to be the same as it was before the advent of penicillin. In the absence of progression of the disease, periodic medical reappraisal (on a six to twelve months basis) to be certain that the disease is truly arrested is probably more important than are additional amounts of specific therapy.

MANAGEMENT OF EPILEPSY AND INSTITUTIONALIZATION

To the Editor:—A youth aged 22 has what appears to be psychic equivalents of epilepsy. He suddenly and without warning faints, falls to the floor, awakes shortly with a severe headache and an absent expression, and staggers aimlessly about in a sort of drunken reel until finally the attack passes and his head is clear. This recurs two or three times a day. The boy seems to have insight into his case, is of average intelligence and is anxious to make something of himself. His background is rich in psychiatric trauma. Up to the age of 17 he lived in an orphanage. Since then he has shifted for himself. For the last two years he has lived a sort of social outcast life, living unhappily in fear of attacks and embarrassment when they come. At present he seems determined to do something worth while with his life despite his attacks, yet I believe the society in which he lives would be loath to tolerate his presence. I am interested to know what society has to offer for this boy. Assuming that his attacks persist unabated, are there epileptic colonies or institutions sponsored by state or federal government where he might live and do some sort of useful work? If so, where are they located, particularly in Pennsylvania? What is the status on which patients are committed? Are they forced to go by law or are these voluntary institutions? *Irvin Cutler, M.D., Philadelphia.*

ANSWER.—The first consideration is whether the patient is receiving the best possible drug therapy. For those with psychomotor seizures this means diphenylhydantoin sodium to the limit of tolerance. Obviously, if seizures can be brought under relative control, institutionalization need not be considered. If indigent, he can be referred to the special clinic for the epileptic at the Jefferson Medical College of Philadelphia for both medical and social service assistance. Employment is preferable to confinement in an institution. Pennsylvania has the two state colonies for the epileptic, one at Selingsgrove and the other at Oakbourne. The Passavant Colony at Rochester, Pa., is under the auspices of the Lutheran church. Patients may enter any of these voluntarily or be committed by court order. Additional information concerning the points raised may be secured from the American Epilepsy League, 50 State Street, Boston.

THE PENICILLIN TREATMENT OF SUB- ACUTE BACTERIAL ENDOCARDITIS

SOME PROBLEMS

ARTHUR L. BLOOMFIELD, M.D.

AND

RICHARD M. HALPERN, M.D.

SAN FRANCISCO

That subacute streptococcic bacterial endocarditis can be "cured" by penicillin therapy now seems securely established.¹ However, among the reported cases there are many in which apparent recovery—disappearance of toxic symptoms, fever and bacteremia—was soon followed by reappearance of organisms in the blood stream and resumption of a downhill course.² Large statistics obtained under uniform conditions are not yet available, but in general recurrence seems to have taken place in one fourth to one half of the treated cases. It is important therefore to inquire into the reasons for failure in the hope of improving a method which has already yielded brilliant results in an otherwise uniformly fatal disease.

THE OPTIMUM DURATION OF TREATMENT

Assuming that one is dealing with a sensitive strain, the first question is that of the optimum time-dose relationships in the administration of penicillin. Over how long a period of time should penicillin be continued and how much should be given each day and in how many doses? Is it necessary to maintain a high blood level during the entire twenty-four hours? These and other similar questions must be answered in order to map out a program which will yield the highest percentage of cures. It is noteworthy therefore that most of the reported patients have been treated for periods of only two to three weeks and rarely longer than four consecutive weeks; as just pointed out, recurrence has taken place in a considerable number of these cases. In contrast to these experiences with relatively brief therapy we have a series treated over a two months period in which very much better results have been achieved. This group, some members of which have already been reported,³ now consists of 18 consecutive

cases. Seven of these patients have been followed after completion of treatment for periods of over a year (twelve to seventeen months), the remainder for periods of three to eleven months. In no instance has there been a recurrence of symptoms of active infection or the return of a positive blood culture. One criterion for the selection of these patients was that the strain of streptococcus be sensitive to penicillin in the test tube in a dilution of at most 0.1 unit per cubic centimeter of culture medium. Furthermore, at least 160,000 to 200,000 units of penicillin was usually given in the twenty-four hours either by continuous drip or in not less than four intramuscular injections. The incidence of bacterial and clinical arrest in 100 per cent of this series is to be contrasted, as has been pointed out, with the figure of approximately 50 to 75 per cent in the more briefly treated cases reported in the literature.

It seems established therefore that, regardless of daily dose, treatment should be continued over a period of at least two months (and perhaps longer in some cases) if the highest percentage of cures is to be obtained. The proposal to treat for a shorter time and then to give more penicillin in case of a relapse does not seem sound to us, since whatever ground was gained by initial inadequate therapy may have been completely lost by the time relapse is evident. Indeed, one may actually be in a worse position since the infecting streptococci may have developed increased resistance to penicillin when subcurative doses are given.

"Pseudo-cure" from treatment not long enough continued is illustrated by the following case:

CASE 1.—A man aged 32, a sheet-metal worker who had had polyarthritis at the age of 13, was told six years ago that his heart was bad. However, he was well and at work until November 1944, when he developed chills, fever, sweats and weakness. The finger tips were sore. A blood culture was reported positive for *Streptococcus viridans* and he received penicillin for three days from an outside doctor. The temperature dropped but recurred when penicillin was stopped. Penicillin was resumed on January 22 at the rate of 120,000 units daily in divided doses. This was continued until entry to Stanford Hospital on Jan. 30, 1945. The temperature then was practically normal but he was sweating. No petechiae were seen and there was no clubbing of the fingers. The spleen was not felt. In the aortic area one heard a loud roughish systolic murmur and an echoing diastolic. The blood pressure was 140/40. Penicillin was discontinued and blood cultures were made to confirm the diagnosis. On January 30 and February 1, 2 and 3 blood cultures all yielded 2 to 3 colonies of nonhemolytic streptococci per cubic centimeter of blood. The organism was partly inhibited by 0.05 unit of penicillin per cubic centimeter of culture medium, completely by 0.1 unit. This strain was therefore not especially sensitive. Penicillin was started on January 3 (fig. 1) at the rate of 25,000 units intramuscularly every three hours except for the omission of one dose at night, a total of 175,000 units daily. This treatment was continued for thirty days, in all 5,460,000 units being administered. During this time his course was uneventful, he felt

From the Department of Medicine, Stanford University School of Medicine.

The penicillin was provided by the Office of Scientific Research and Development from supplies assigned by the Committee on Medical Research for clinical investigations recommended by the Committee on Chemotherapeutic and Other Agents of the National Research Council.

perfectly well and the rectal temperature curve showed very slight elevation, rarely above 37.5 C. (99.5 F.). During the month of treatment seven consecutive blood cultures were sterile. Penicillin was stopped on March 4, when the infection appeared to be arrested. The temperature remained practically normal, the physical signs over the heart were unchanged and the patient felt perfectly well but blood culture two days later (March 6) was again positive. A second culture on March 8

Fig 1—Course in case 1 ("P" means penicillin).

also yielded several colonies per cubic centimeter of blood. The prompt recurrence of bacteremia made it clear that the infection had not been eliminated by four weeks of treatment but merely suppressed to a point where no organisms were recovered by the relatively crude technic of blood culture.³ The strain recovered on March 6 seemed to be the same as that isolated before treatment was started and the organism showed the same in vitro sensitivity to penicillin. Inadequate treatment in this case did not lead to increased resistance. On March 5 penicillin therapy was resumed (fig. 1) at the rate of 40,000 units intramuscularly every three hours, or 320,000 units daily. This dosage was continued for sixty days. The blood again immediately became sterile and ten cultures during the treatment period yielded no growth. This time the infection appeared to be eliminated and four blood cultures made after penicillin was discontinued were all sterile. The patient left the hospital on May 11, and follow-up examination on August 21, over three months later, showed no signs of recurrence and blood culture was negative.

THE OPTIMUM DAILY DOSAGE

Our first cases were treated by continuous intravenous infusion of penicillin on the presumption that it was advisable to maintain an effective blood level at all times. Technical difficulties, however, forced a trial of intermittent intramuscular injections and it soon was evident that large doses of penicillin given every three hours were fully effective in the ordinary case with a sensitive strain of streptococcus. It was clear that regardless of theory a continuous blood level was not always necessary in practice and the question came up as to the minimum number of daily injections which would suffice for a cure. This problem has been dealt with experimentally in our laboratory by Javetz,⁴ who finds in the case of streptococcal peritonitis in the mouse that nearly all the animals can be saved from an other-

wise fatal infection by injections of penicillin at four hour intervals provided the individual doses are sufficiently large.

A group of 4 patients were treated with intramuscular injections given only every six hours for two months. The individual dose as a rule was 50,000 units. Three of these patients are apparently well. In the fourth this plan of treatment seemed inadequate and cure was obtained after treatment was intensified. Case 2 illustrates cure of bacterial endocarditis by intramuscular injections given every six hours:

CASE 2.—A woman aged 22, a housewife, entered the hospital on Aug. 11, 1944 complaining of fever and weight loss for a month. She was said to have had a heart murmur since early childhood, but there was no definite story of rheumatic fever. A tooth was extracted in May 1944, but no symptoms developed at that time. On entry fever varied from 38 to 40 C. (100.4 to 104 F.). She was somewhat thin. There were a few scattered petechiae. The spleen was felt 3 cm. below the costal margin. There was a loud systolic murmur at the apex. There was definite anemia, but the urine was clear. Blood culture yielded 100 colonies of nonhemolytic streptococci per cubic centimeter. The strain was completely inhibited in vitro by 0.1 unit of penicillin per cubic centimeter of medium but not by 0.04 unit. Penicillin was started (fig. 2) on August 21 in a dosage of 50,000 units intramuscularly every six hours. Within forty-eight hours the patient felt much better and "toxic" symptoms disappeared. The temperature began to fall promptly and was practically normal within a week. The course from this time on was uneventful except for pain in the left side and swelling of the spleen from the eleventh to the seventeenth days of penicillin administration, probably because of splenic infarct. Blood culture taken the day after penicillin was started was sterile, and eleven subsequent cultures through October 13 were consistently negative. On August 22 she received a transfusion and from that time the blood count rose and was essentially normal on discharge. Penicillin was given at the rate of 200,000 units daily for thirty days. The dose was then dropped to 120,000 units daily given in four injections of 30,000 units. The total amount of penicillin given during the sixty days of treatment was 9,590,000 units. The temperature remained essentially normal and during the last week of her hospital stay—after penicillin had been stopped—did not go above 37.4 C., or 99.3 F. (rectal). During this period four blood cultures were sterile. During the latter part of her stay there were no embolic symptoms, nor were any petechiae seen. On discharge, October 28, the same loud systolic murmur heard on entry was still present. The tip of the spleen was just felt at the costal margin. She felt perfectly well. On follow-up visits in Decem-

Fig. 2—Course in case 2.

3. Interpretation of "negative" blood cultures. Failure to recover bacteria does not exclude the presence of living organisms in the vegetations or in the blood stream. Negative blood cultures may be obtained for one of the following reasons:

1. The bacteria may be so few in number that they may actually be absent from small samples of blood.
2. The bacteria may fail to grow in culture if their numbers are few or their nutritive requirements fastidious.
3. Bacteria may be filtered out in capillaries if venous blood is used for culture, although blood from antecubital veins gives colony counts only slightly lower than arterial blood (Beeson, P. B., Brannon, E. S., and Warren, J. J.: Observations on the Sites of Removal of Bacteria from the Blood in Patients with Bacterial Endocarditis, *J. Exper. Med.* 51:7, 1945).
4. If the immunity of the body is high, organisms swept into the blood stream from a valve may be promptly killed or inhibited so that growth fails.
5. The bacteria may be growing chiefly in masses of vegetation, where they are sealed off by fibrin so that bacteremia is rare.
6. With right sided lesions it may be hard to isolate bacteria from the peripheral venous blood because of filtration in the lungs.

4 Javetz, E. Observations to be published

ber 1944 and in January and February 1945 blood cultures remained negative and she felt perfectly well.

In March 1945 she was found to be three months pregnant. Her condition was so good that it was decided to let the pregnancy continue. In August 1945 nearly at term she showed no signs of cardiac failure or of active infection, and blood culture was sterile ten months after conclusion of penicillin therapy. On August 6 she was delivered of a healthy baby without difficulty and went through an uneventful puerperium. Blood cultures were negative.

Even though the strain of streptococcus was not highly sensitive to penicillin in the test tube, cure was accomplished by a scheme of treatment in which "effective" blood levels were maintained for not more than one fourth of the time. It is obvious therefore that factors other than bactericidal effect enter into the process of recovery.

Fig. 3.—Course in case 3.

When it was found that injections given only four times in the twenty-four hours sufficed to arrest the infection in some cases, it was decided to try the effect of penicillin given at twelve hour intervals. As will be seen from the following case report, two intramuscular injections of 60,000 units each in the twenty-four hours suppressed the evidence of active infection, but positive blood cultures were immediately obtained when penicillin was stopped even though the treatment had been continued over a period of two months:

CASE 3.—A man aged 60, Greek, a tailor, had previously been well and was unaware of any heart trouble. Five weeks before entry all his teeth were extracted. He bled a great deal and was too weak to resume work. To weeks or so later he noticed fever and sweats. On entry, Sept. 15, 1944, he looked ill. He was febrile and sweaty. Some fading petechiae were seen in the conjunctivas. There was a blowing diastolic murmur in the aortic area. The spleen was not felt and there was no clubbing of the fingers. There was pronounced anemia. The urine was clear. Blood culture yielded 25 colonies of a non-hemolytic streptococcus per cubic centimeter. These organisms were completely inhibited by 0.05 unit of penicillin per cubic centimeter of culture medium, so that the strain was quite sensitive. Penicillin was started (fig. 3) on September 15 in a dosage of 50,000 units intramuscularly every six hours, or 200,000 units daily. The temperature promptly dropped to normal and the blood culture became sterile. After two weeks of this dosage it was decided to give only two injections of 60,000 units each in the twenty-four hours. During a period of forty-five days on this dosage thirteen blood cultures were all negative and except for a mild episode of fever on the twenty-eighth and thirtieth days of treatment, probably the result of pulmonary infarct, the temperature remained practically normal and the patient felt well. On the forty-fifth day of treatment he had a short bout of auricular fibrillation. When sixty days of penicillin treatments were concluded on November 14 it was believed that he was probably cured. However, blood culture November 16 was positive; culture on November 17 yielded 1 colony per cubic centimeter, November 18, 4 colonies and November 21, 80 colonies. By this time the temperature was again highly elevated and it was clear that the apparent arrest of the disease by two daily injections was actually not achieved. The strain isolated on November 18 showed no definite change in sensitivity, being partly inhibited by 0.05 unit and completely by 0.1 unit. Treatment was resumed on November 21 at the rate of 25,000 units intramuscularly every three hours, or 200,000 units daily. The temperature promptly fell to normal and blood culture on November 25 as well as all subsequent cultures was sterile. The infection again seemed to be extirpated, but the patient now had frequent bouts of auricular tachycardia, auricular fibrillation and some-

times flutter. Evidence of congestive failure developed. On December 25 he had a bout of acute left ventricular failure. X-rays showed great increase in the size of the heart since entry. On December 30 he had frank cardiac failure and on Jan. 1, 1945 he died suddenly. Autopsy was not permitted.

These 3 cases illustrate very clearly the importance of time-dose relationships in the penicillin treatment of bacterial endocarditis. It is clear that one must consider (1) the size of the individual dose and the number of doses in twenty-four hours, (2) the total twenty-four hour dosage and (3) the total duration of treatment. Even with frequent large doses cure often is not achieved if the duration of treatment is brief (one to three weeks), as pointed out in the literature.² On the other hand, even long treatment (two months) fails if the daily doses are too few or too small. At the present time then, assuming that the strain is sensitive, the best treatment seems to consist of four to eight intramuscular injections of penicillin in the twenty-four hours with a total daily dose of at least 200,000 units continued over a two months period. This scheme will doubtless be modified when proper methods for prolonging the action of penicillin are developed, but the principles brought out will be unchanged. Much further study of these time-dose relationships is obviously necessary.

STRAIN SENSITIVITY

Fortunately only a small percentage of patients with subacute bacterial endocarditis have strains of streptococcus which are "completely" resistant to penicillin, so that the organism grows freely in mediums containing large amounts of the antibiotic.³ In cases of this sort it has been our experience that penicillin is entirely ineffective. On the other hand the patients who respond promptly to penicillin therapy usually have strains which are inhibited in the test tube by 0.05 unit or less of penicillin per cubic centimeter of culture medium. If more penicillin than 0.1 unit per cubic centimeter is required for inhibition, the strain is regarded as not highly sensitive and "standard" treatment may be ineffective.

Failure of ordinary treatment in a case with a relatively resistant strain but ultimate cure by very large doses of penicillin is illustrated by the following report:

CASE 4.—A woman aged 48, a housewife, had been ill with chills, fever and aching for two months. Blood culture had been found positive several times for *Streptococcus viridans*. There was no story suggestive of any heart trouble in the past. There was moderate fever. No petechiae were seen. The first heart sound at the apex had a thudding quality and was followed by a soft systolic murmur. It was supposed that she had a mild congenital lesion, possibly a septal defect with bacterial implantation. There was no clubbing of the fingers and the spleen was not felt.

Blood culture on Oct. 14, 1944, before treatment was commenced, yielded 110 colonies of nonhemolytic streptococci per cubic centimeter. The sensitivity test showed that 0.2 unit of penicillin per cubic centimeter of medium was necessary for complete inhibition. This strain was therefore not highly sensitive but it seemed sufficiently on the borderline to justify treatment. Penicillin was started on October 17 (fig. 4) and continued for sixty days—from October 17 to October 25, 50,000 units every six hours intramuscularly; October 25 to November 9, 40,000 units every three hours intramuscularly; November 9 to November 16, 400,000 units daily by continuous intravenous drip; November 16 to December 16, 40,000 units every three hours intramuscularly. Under this treatment the

5. Dawson, M. H.; Hobby, G. L., and Lipman, M. O.: Penicillin Sensitivity of Strains of Nonhemolytic Streptococci Isolated from Cases of Subacute Bacterial Endocarditis, *Proc. Soc. Exper. Biol. & Med.*, 56: 101, 1944. Watson, R. F.: Sensitivity of Various Serological (Lancefield) Groups of Streptococci in Penicillin, *ibid.* 57: 65, 1944.

temperature gradually declined, although slight elevations persisted. Her general condition improved greatly and she felt quite well. It was impossible, however, with these dosages to obtain consistently negative blood cultures; for the most part they yielded 1 to 6 or 8 colonies per cubic centimeter. Subsequent sensitivity tests on three isolations showed growth to be inhibited by 0.1, 0.2 and 0.4 unit per cubic centimeter. In summary, then, this is an instance of *S. viridans* infection which we could not extirpate with "standard" intensive penicillin therapy. This failure was probably due to high resistance of the strain; not only this, but the organisms appear to have become more resistant under subcurative doses of penicillin.

The patient left the hospital on Dec. 16, 1944 and returned on Jan. 3, 1945 for further treatment (fig. 4). The temperature varied from 38.5 to 40 C. (101.3 to 104 F.). There was decided anemia with 66 per cent of hemoglobin, and blood culture January 4 yielded 115 colonies of nonhemolytic streptococci per cubic centimeter, which was not inhibited by 0.1 unit per cubic centimeter of medium. The physical signs were unchanged. It was decided to treat the patient with sulfadiazine and penicillin. Six Gm. of sulfadiazine was given daily from January 6 to February 16, when the dose was increased to 9 and then

Fig. 4.—Course in case 4.

to 12 Gm. daily until March 8, when it was gradually reduced and finally stopped on March 19. Penicillin was started on January 10 at the rate of 320,000 units per day, 40,000 units intramuscularly every three hours. On February 8 this was increased to 480,000 units daily until March 16, when it was reduced for two days to 160,000 units and then stopped. Following the start of the treatment described there was a prompt fall of temperature to normal, where it remained for over a week (fig. 4). She felt much better and the blood culture showed fewer organisms (3 to 10 colonies per cubic centimeter). However, the blood stream did not become sterile, with the exception of one negative culture on January 15, and during February the temperature gradually rose in spite of continued therapy. During March it began to range as high as 39 C. (102.2 F.), and on February 26 blood culture yielded 50 colonies per cubic centimeter. To inhibit the organisms, 0.5 to 1.0 unit of penicillin per cubic centimeter of medium was now necessary.

It was clear therefore that while the aforescribed procedure was followed at first by some clinical improvement and a reduction in the degree of bacteremia, she eventually "relapsed" in spite of treatment, with return of high fever and heavy bacteremia. Furthermore the strain of streptococcus seemed to become more resistant and required 1 unit per cubic centimeter of medium for inhibition, whereas at the start 0.2 unit was

effective. However, on March 12 and 19 without further penicillin therapy the strain appeared more sensitive and required only 0.4 unit for complete inhibition (fig. 4). It is possible, however, that these findings are not significant.

It was decided to make a more vigorous assault on the disease. On March 18 the sulfadiazine, which seemed to be entirely ineffective, was finally stopped and on the 20th penicillin was resumed by continuous intramuscular drip at the rate of 1,000,000 units in the twenty-four hours. This amount of penicillin was suspended in 500 cc. of isotonic solution of sodium chloride. There were some difficulties in regulating the flow, but from March 20 to April 16 she received 24 million units by this method. From April 18 on she received 125,000 units intramuscularly in 5 cc. of saline solution every three hours, 1 million units per twenty-four hours until May 22, a total of 33,750,000 units.

As soon as the large doses (1 million units per day) were started there was prompt improvement (fig. 4). The temperature declined and she felt better. One day after treatment the count in the blood culture fell to 4 colonies per cubic centimeter and from then on 20 cultures during the course of treatment were all sterile. She was discharged on May 31 feeling perfectly well and with essentially normal temperature. During the last part of her stay a number of bad teeth were removed without ill effects. The physical signs over the heart were unchanged, but there was no evidence at all of cardiac failure.

Measurements of the level of penicillin in the blood after intramuscular injection of 125,000 units showed about 0.2 unit per cubic centimeter at the end of three hours. Hence there was an effective level most of the time.

Last follow-up three months after leaving the hospital showed that the patient was clinically well with no evidence of infection and negative blood cultures.

In summary, then, a patient with bacterial endocarditis whose strain was moderately insensitive was not cured or rendered bacteria free by rather large doses of penicillin and sulfadiazine given over a period of some three months. Indeed, after initial improvement she seemed to "escape" from the effects of the drugs and her strain was found to be more resistant than at the start. The strain seemed to become more sensitive after penicillin was stopped, and then very heavy penicillin therapy appears to have been effective in eradicating the infection.

The chart shows clearly the lowering of temperature and decrease in number of colonies in the blood stream with subcurative doses of penicillin. We believe, on the basis of the work of Beeson, Brannon and Warren, who showed the remarkable constancy of colony counts on successive blood cultures in untreated cases, that the trend of quantitative blood cultures is of great importance in evaluating the effect of therapy.

It is clear then that the sensitivity of the strain must be taken into account in planning therapy, and with strains which are more resistant than usual very large doses of penicillin may be necessary to accomplish a cure.

ALTERATIONS IN RESISTANCE OF STREPTOCOCCI UNDER TREATMENT

The possibility of bacteria of all sorts becoming resistant to penicillin by exposure to sublethal doses has been demonstrated both experimentally and in the clinic.⁶ There is good reason therefore, in theory at least, for always giving intensive therapy in bacterial endocarditis. Case 4 is a clear instance of increasing resistance of streptococci under inadequate penicillin therapy, since the strain which at first was inhibited by 0.2 unit per cubic centimeter of culture medium later grew freely in this concentration and 0.5 to 1 unit was necessary

6. Spink, W. W.; Ferris, V., and Vivino, J. J.: Antibacterial Effect of Whole Blood on Strains of Staphylococci Sensitive and Resistant to Penicillin, *Proc. Soc. Exper. Biol. & Med.* 55: 210, 1944.

completely to prevent growth. It is of interest that the resistance of this strain was higher when the dosage of penicillin was inadequate than it was after penicillin was stopped altogether. However, the change may have been within the limits of error of the method. In cases 1 and 2 subcurative doses of penicillin did not seem to lead to alteration of sensitivity of the strain.

FAILURE OF TEMPERATURE TO FALL UNDER PENICILLIN THERAPY AFTER THE BLOOD STREAM HAS BEEN STERILIZED

One of the most troublesome problems in the treatment of bacterial endocarditis has been persistence of fever for long periods even though blood cultures have become sterile under penicillin therapy. We have encountered this state of affairs in a number of our cases and the interpretation has been extremely difficult. Is persistent fever simply due to inadequate treatment? Does it indicate disintegration and absorption of large vegetations? Is it the result of some unrecognized complication? Is it caused by penicillin itself or by an impurity in the preparation? In case 9 of the series previously reported¹ the temperature did not begin to fall until the twenty-first day of treatment. The case here reported is an even more striking example of this problem:

CASE 5.—A man aged 47, who was said to have had rheumatic fever in childhood, was subject to palpitation and dyspnea for many years. Three months before examination he had a stroke with left-sided weakness, and for the past three weeks there had been chills and fever. On entry the heart was enlarged, the rhythm totally irregular. There were the signs of aortic stenosis and insufficiency and possible mitral stenosis. The spleen was palpable. Blood culture yielded a nonhemolytic streptococcus which was inhibited by 0.05 unit of penicillin per cubic centimeter. As the patient was not in cardiac failure it was decided to try penicillin. Treatment was started on Dec. 29, 1944 in doses of 50,000 units intramuscularly every six hours, or 200,000 units per day (fig. 5). Blood cultures promptly became negative, but the temperature did not subside and indeed after two weeks was higher. The dose was therefore increased on the twenty-seventh day to 30,000 units every three hours, or 240,000 units per day. However, the fever continued and on the fortieth day penicillin was stopped to make sure that fever was not caused by an odd reaction to the material. However, the temperature did not fall during a four day period without penicillin, so it was resumed and continued until the sixty-fifth day. It was not until about the fiftieth day that the temperature definitely began to fall, and at the end of the treatment period it was nearly normal. During the last week in the hospital after penicillin was stopped the temperature rose only to about 37.5 C., or 99.5 F. (rectal). On approximately the thirtieth day of treatment he developed pain in the right side and a friction rub, evidently from pulmonary infarct. This cleared up in a few days and no other complication was recognized. The explanation of the persistence of fever for such a long time is not clear. This patient was seen three weeks after discharge. He had no signs of infection or cardiac failure and the temperature was normal. Follow-up study six months after discharge shows no evidence of infection, blood cultures are negative, and temperature is normal.

In this case the prolonged fever was not explained. It did not seem to be due to reactions to penicillin, to penicillin impurities, to inflammatory complications or to persistence of active infection. The ultimate drop in temperature suggests that disintegration and absorption of masses of vegetation was going on, and under these circumstances it is possible or indeed probable that bacteria still persisted in the lesions in spite of the blood cultures being sterile. Continued fever seems, therefore, to be an indication for prolonged therapy, and the event in this case supports this position.

CARDIAC FAILURE

Every one who has discussed the use of penicillin in bacterial endocarditis has agreed that cardiac failure is in a sense a contraindication to treatment. Decompensated patients are less likely to profit by extirpation of the infection than those with good hearts, and failure may actually become worse under therapy. Case 3 illustrates the development of congestive failure during the course of penicillin therapy. On entry there was no sign whatever of cardiac failure and the heart did not seem to be enlarged. On the forty-fifth day of treatment at a time when the temperature was normal and the patient seemed to be doing very well he had a bout of transient auricular fibrillation. From this time on there were various arrhythmias and finally frank congestive failure. A few days before death cardiac enlargement, gallop rhythm, edema of the lungs and engorgement of the liver were noted. Death was clearly due to a cardiac accident.

Cardiac failure of some extent occurred in 8 of our entire series of 21 cases. In 4 frank failure, serious disturbances of rhythm or cardiac accident (coronary embolus?) were noted. In the other 4 there was no frank failure but there was a definite lowering of cardiac reserve after the conclusion of therapy.

What is the explanation of this high incidence of cardiac difficulties? First of all one may say that heart failure is less likely to occur if the initial anatomic

Fig. 5.—Course in case 5.

valve lesion is insignificant. But there is no absolute rule about this. C. B., for example (case 3 in the previous series¹), with an old mitral lesion apparently of slight degree, did not have any symptoms of failure before the onset of bacterial endocarditis, and the infection was promptly cured by penicillin. None the less he developed tachycardia with definite deterioration of cardiac function followed in a few months by congestive failure. Such failure is probably not due purely to the lesion which was present before the bacterial implantation. In other words there is no reason to believe that such a high percentage of patients with uncomplicated cardiac lesions would develop failure in so short a time. On the other hand it is also improbable that the mere presence of infection would induce cardiac failure so commonly even if one admits the frequency of myocardial lesions in bacterial endocarditis, as pointed out by some pathologists.⁷ We are inclined to think that the anatomic changes produced by penicillin therapy in valves the seat of vegetative endocarditis may promote cardiac failure. This view is supported by autopsy on a treated case with mitral stenosis in which the valves, while in a sense healed, were reduced to shrunken vestiges following absorption of the vegetations. In other words, one faces the paradox that elimination of infection is associated with further destruction of valves in certain cases. This conclusion of course in no way weakens the imperative indication for penicillin therapy;

7. Saphir, O.: Myocardial Lesions in Subacute Bacterial Endocarditis. *Am. J. Path.* 11: 143, 1935.

it does emphasize the importance of recognizing the active infection and starting therapy as early as possible, before valves have been extensively affected. Further experience of sufficient extent to allow statistical conclusions will be very important.

CARDIAC ARRHYTHMIAS AND ACCIDENTS

Quite aside from congestive failure, accidents and disturbances of mechanism have been very frequent. The accompanying table summarizes all the cardiac complications in our patients, and the following case illustrates more in detail the occurrence of a cardiac accident and disorders of rhythm under treatment:

CASE 6.—A man aged 27, a draftsman, had been well until about three weeks before entering. He then noticed constricting pain in the chest, fever and malaise. Blood culture was found to be positive and he was sent in for penicillin therapy. There was no definite history of rheumatic fever but a vague story of "heart trouble" years before. On examination his general condition seemed good. There was a loud, rough systolic murmur at the aortic area and over the heart in general. There was no clubbing, and no petechiae. The liver and spleen were not felt. There was high irregular fever, and second and third cultures were positive for nonhemolytic streptococci—a few colonies per cubic centimeter completely inhibited by 0.05 unit of penicillin per cubic centimeter of medium. The patient seemed the ideal case for penicillin therapy and treatment was started on March 3, 1945 at a rate of 320,000 units per day in eight doses by intramuscular injection. This treatment was continued for sixty days. Blood culture two days after the start of therapy was negative, as were eighteen subsequent blood cultures both before and after treatment. As far as elimination of infection was concerned, treatment was promptly effective. However, on the day after the start of therapy the patient had violent pain and electrocardiographic evidence of coronary occlusion (perhaps embolic from a bit of vegetation). During his course there were numerous bouts of disturbed cardiac mechanism—auricular fibrillation, flutter and extrasystoles, often with fever. Some of these bouts were thought to be due to pulmonary emboli. However, during the last few weeks of his hospital stay he was quite well (with practically normal temperature) except for a few brief paroxysms of auricular fibrillation. Electrocardiograms are shown in figure 6.

The patient seemed cured of the bacterial infection but remained a cardiac problem not because of his old valve lesion (aortic stenosis) but because of cardiac infarction and arrhythmias. He was seen frequently

Cardiac Complications During Penicillin Therapy

	Number	Per Cent

after leaving the hospital, and a number of blood cultures, the last one three months after the conclusion of treatment, were all sterile. He continues, however, to have occasional bouts of cardiac arrhythmia.

In summary it seems quite clear that the patients in this series had an unexpectedly high incidence of cardiac failure and of disturbances of mechanism. Since only 2 of them showed evidence of failure before treatment was started, the question is open as to whether altera-

tions in vegetations and in valves as a result of penicillin therapy may on occasion promote these disturbances. It is noteworthy that the 2 patients who had the most serious complications had what appeared to be simple lesions of no great extent when treatment was started (cases 3 and 6).

Fig. 6.—Electrocardiograms from case 6:
 March 3, lead 1, RST slightly depressed.
 March 5, lead 1, changes in T waves have progressed.
 March 8, lead 1, auricular fibrillation; further change in T waves.
 March 9, lead 1, auricular fibrillation continues.
 March 10, lead 1, sinus rhythm; further changes in T waves.
 March 15, lead 1, progression of T wave changes.
 March 23, lead 1, auricular fibrillation.
 March 26, lead 1, auricular fibrillation.
 March 27, lead 1, auricular flutter, 3:1 block.
 March 28, lead 2, auricular fibrillation.
 March 29, lead 1, sinus rhythm; compare T waves with those of March 3 and 5.
 March 30, lead 3, shows very deep Q wave.
 April 3, lead 3, Q wave has disappeared and T wave has changed.
 April 21, lead 2, auricular fibrillation.
 April 25, lead 1, sinus rhythm.
 April 26, lead 1, extrasystoles.
 May 28, lead 1, further changes in RS-T segment.
 July 11, lead 2, auricular (or nodal) tachycardia.

COMMENT

The entire question of recovery in bacterial endocarditis has, in the past, been in a state of confusion. Thus, in the literature one encounters the designations cured, healed, bacteria free, active, inactive, recovered and intermittently active. Most of these terms express perplexity on the part of the observer as to the exact status of his patient. Libman,⁸ following Harbitz,⁹ pointed out years ago in autopsy material the frequency with which portions of the lesion seemed to be healing even as the process progressed elsewhere. Part of a valve might, for example, show flat organized or even calcified plaques, whereas not far away the lush vegetations typical of active infection would be found. In many of Libman's cases the cardiac lesions at autopsy are described as being completely healed, and it appears that usually no bacteria could be seen in sections of the valves. More recently Hamman¹⁰ has pursued the subject. Some of his patients had lesions which anatomically appeared healed and showed only fibrosis and calcification, without fresh vegetations. The striking thing, however, about the patients of Libman, Hamman and others is that the "spontaneous" healing which they describe came too late to serve any useful purpose, since the patients died of irreversible lesions of kidney, bone

marrow and so on. We are confronted therefore with the paradox of a disease which always kills and yet often reveals to the pathologist a healing lesion. We conceive that penicillin therapy hastens and abets this natural tendency to healing to a degree which makes clinical recovery possible. From the nature of the case, however, considerable time is necessary for the absorption and organization of vegetations, and the cocci must be gradually "dug out of their fox-holes" and destroyed in order to prevent progressive damage. No matter how large a daily dose of penicillin is given, it seems improbable that complete healing of extensive vegetations could take place in two or even three weeks; bacteria may be killed off in the superficial parts of vegetations, but relapse would be expected as the organisms work out of the deeper layers, and indeed this is exactly what seems so often to have taken place with inadequate therapy.

This position is strongly supported by the autopsy findings in 1 of our cases (previously reported as case 2¹) apparently cured by penicillin, but ending in death later of heart failure. The anatomic findings corresponded closely with those which have been described in the cases with spontaneous healing, except that they are more complete and uniform. All the vegetations had disappeared, leaving shrunken valves with flat scarred and calcified plaques. Even so a few cocci could still be seen in sections made from the depths of the valves.

SUMMARY

The cases herewith presented show that while the treatment of subacute bacterial endocarditis with penicillin yields on the whole remarkably good results, a number of problems and difficulties still remain, among which the following are outstanding:

There appears to be a correlation between strain sensitivity *in vitro* and the clinical response. If the organisms require more than 0.1 unit of penicillin per cubic centimeter of medium for complete inhibition of growth the case is likely to be refractory to the amount of treatment usually given and doses up to 1 million units per day may be necessary to extirpate the infection. Sensitivity tests are essential to the intelligent treatment of these cases.

The entire matter of optimum time-dose relationships is still under investigation. The cases show that to obtain the most secure results treatment should be continued for a long period—probably at least two months—but even long continued treatment is ineffective if the daily dose of penicillin is too small and/or the number of injections too few. Subcurative therapy may produce deceptive pseudocures with disappearance of symptoms, drop in temperature and sterile blood cultures, but with return of bacteremia as soon as treatment is stopped.

Increased resistance *in vitro* of a strain of streptococcus from a case inadequately treated occurred. The patient was cured by large doses of penicillin (1 million units per day). The practical importance of development of refractory strains from patients with bacterial endocarditis is not yet clear. Unexplained fever may persist for a long time under treatment even though blood cultures are sterile and the patient is evidently cured.

A disturbingly high incidence of cardiac complications (aside from the original lesion) including congestive failure, mild impairment of function, arrhythmias and coronary accidents occurred in this series. The deformities and destruction of valves which seem to go hand in hand with the absorption of vegetations under penicillin therapy may account for some of these disorders.

TRANSMISSION OF POLIOMYELITIS BY PATIENT TO PATIENT CONTACT

ALBERT E. CASEY, M.D.

BIRMINGHAM, ALA.

AND

WILLIAM I. FISHBEIN, M.D.

UNDER THE DIRECTION OF

HERMAN N. BUNDESEN, M.D., Sc.D.

CHICAGO

For some years Dr. Herman N. Bundesen, chairman of the Epidemic Committee of the National Foundation for Infantile Paralysis, Inc., has believed that a coordinated and systematic field study of the epidemiology of poliomyelitis should be undertaken by a single group of well trained persons over an extended period. The opportunity for the beginning of such a study presented itself in the summer of 1945 when a special survey of poliomyelitis was organized in Chicago.¹ A case finding program was undertaken to (a) establish, if possible, the amount of unrecognized poliomyelitis in urban communities, (b) determine the relative incidence of the paralytic and nonparalytic forms of the disease, (c) investigate contact between cases in the spread of urban poliomyelitis and relate this, if possible, to the various age groups, (d) evaluate the roles of the nose, throat, mouth and feces, if any, in the transfer of the virus from one patient to another and (e) detect the presence or absence of perennial geographic foci of the disease in the city of Chicago.

Certain observations on the incubation and infectious periods in poliomyelitis first made in Walker County, Ala., in 1941² have since been confirmed.³ These were that the infectious period in the great majority of those cases studied is three days before or three days after the onset of the prodromal period and that the incubation period (from exposure to the onset of the prodromal period) is from four to thirty-five days, averaging twelve days. A further observation made in Walker County, for which confirming evidence hitherto has not been noted, was that the transmission of the disease could be established as at least 80 per cent patient to patient contact, whether through the mechanical use of hands, mouth, nose, insect or other methods. It seemed that insects played a minor part, if any. These observations

From the laboratories of the Chicago Health Department and the Birmingham Baptist Hospitals.

1. The field work (case finding program) was supported in part, by a grant from the Cook County chapter of the National Foundation for Infantile Paralysis. This chapter, through the efforts of Dr. Morris Fishbein, agreed to contribute a portion of its local funds for this purpose. The entire facilities of the Chicago Health Department were made available, and an executive committee was appointed consisting of Dr. Herman N. Bundesen, president of the Chicago Board of Health, chairman; Dr. William I. Fishbein, epidemiologist of the Chicago Health Department, and Dr. Morris Fishbein, editor of *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*. Dr. George W. McCoy, professor and director of the department of preventive medicine and public health at Louisiana State University, was appointed chairman of the advisory committee. The remainder of the advisory committee included Dr. John L. White, chief sanitary officer of the Chicago Health Department; Dr. Howard J. Shaughnessy, director of the Illinois State Bureau of Laboratories; Major Joel E. Connolly, assistant to the president of the Chicago Board of Health; Dr. Sidney O. Levinson, director of the Samuel Deutsch Serum Center of Chicago, and Dr. A. L. Hovne, superintendent of the Chicago Municipal Contagious Disease Hospital. Dr. Albert E. Casey was asked to draw up a plan for the Chicago studies similar to that used by him in Walker County, Ala., in 1941 and to map out a coordinated research plan. This plan, with some modifications made by the personnel of the Chicago Health Department, was accepted by the executive committee and approved by the advisory committee and two co-chairmen of the Cook County chapter of the National Foundation for Infantile Paralysis, Col. A. A. Sprague and Britton I. Budd.

on patient to patient contact were made in a rural area during a severe epidemic (Alabama, on the basis of case reports, was the most intensively affected state in the Union in 1941 and Walker County the area of highest concentration of reported cases) and would indicate that the disease is highly contagious. Chicago in 1945 presented an unusual opportunity to test the same methodology in the study of the disease in a large urban community during a nonepidemic year.⁴

This paper, therefore, reports investigations of patient to patient contact and observations on the incidence of usually unrecognized cases of poliomyelitis of various types. Because more weight is likely to be given to investigations in neighborhoods where paralytic poliomyelitis was present, this report is limited to three patient neighborhoods wherein resided 7 patients with paralytic poliomyelitis (and their respective control neighborhoods).

MATERIALS AND METHODS

When a case or suspected case of poliomyelitis was reported to the Chicago Health Department, a history was immediately taken and a physical examination made by the pediatrician experienced in the diagnosis of poliomyelitis, who participated in the study. If positive or suggestive of poliomyelitis, the patient was transferred to the Municipal Contagious Disease Hospital or to a private hospital properly equipped to handle poliomyelitis, where spinal puncture and confirming examinations could be made without jeopardy to the patient. When the diagnosis was confirmed, a neighborhood investigation was undertaken by the staff of trained investigators to determine if any other cases were present in the neighborhood; if any were found, they were included in this study. The patient's neighborhood was defined as that block or area within one block radius of where the patient resided during the infectious period. A census was taken of all persons under 25 years of age in the neighborhoods studied, and the chronology and symptomatology of all illnesses from June 15 (when the study was started) to date were noted on each person in that age group. A casual but not detailed inquiry as to febrile illnesses prior to June 15 was obtained, and a casual survey of the neighborhood and premises as to the disposal of feces, the water supply, sewerage, garbage disposal, flies and other insects was made, but nothing unusual was found.

When a case of poliomyelitis was present in a neighborhood, careful, detailed checked and rechecked histories of the playing habits, visits and housing of all persons under 25 years of age were compiled, especially with reference to the period three days before and three days after the onset of the prodromal period in the patient and in other persons in the neighborhood who had illnesses compatible with poliomyelitis. Although most of the children in a block had been with one another at some time after June 15 in the neighborhoods studied, only a portion of these, as far as could be ascertained, had associated with the patient during the period described and defined in this study as the infectious period.

Those persons who were closely or intimately associated in play or otherwise with the patient for a total period of more than ten minutes during the infectious period were defined as contacts in this study. Those

persons living in the same or adjoining blocks who were not associated for this length of time with the patient during his infectious period or with any other person with an illness seemingly compatible with poliomyelitis during his infectious period were defined as noncontacts (even though these persons may have played with the patient at some prior or subsequent period). Most of the noncontacts were children on the street across the alley from the patient, or in a block distant or across the street from the patient, although in some instances there was no evidence that even next door neighbors associated with the patient during the infectious period. Evidence on these points of association was obtained from the children themselves rather than relying principally on the statements of the adult population. The chronology was checked and rechecked for accuracy.

As an epidemiologic control, a collateral investigation was made in a neighborhood ten or fifty blocks distant from the patient's residence, depending on the location in the city, where there were no known cases of poliomyelitis. In all but one instance these control areas were at least one-half mile away from any known case of poliomyelitis. The distances were rotated north, south, east and west so that equal numbers of controls were located in the four parts of the city. The same census of persons under 25 years of age, the same investigation as to illnesses and visits, playing habits and sanitary conditions was made as in the poliomyelitis patient's neighborhood. Minute details of the minor illnesses were obtained and checked by the field epidemiologist (and by the pediatrician as indicated). Persons under 25 years studied in these control neighborhoods were designated in this study as controls.

Daily temperatures, nose, mouth and throat swabs and daily stool specimens were obtained from 6 persons in each neighborhood where there was a case of poliomyelitis and in each control neighborhood. These persons were generally those who had had a history of no prior illness since June 15. In the patient's neighborhood, 4 or 5 of the 6 were usually contacts and 1 or 2 noncontacts. Also 4 of the 6 were usually between 1½ and 9½ years of age, 1 between 10 and 15 and 1 between 15 and 24. The children selected as contacts were those most closely in contact with the patient when such children could be enlisted in the study. The purpose of this procedure was to attempt to have stool, throat, mouth and nose specimens on children who subsequently came down with clinical or subclinical poliomyelitis. In this way it was hoped to obtain information on the presence of the virus in the body during the late incubation period. To carry out this phase of the study it was necessary to have the disease reported to the epidemiologist promptly, so that the intimate contacts of the patient and a set of controls could be enlisted in the study within six days after the onset of the prodromal period in the patient.

Often it was discovered that the case first reported was not the first case of poliomyelitis in the neighborhood. When a good history of a febrile illness compatible with poliomyelitis was obtained on a prior or subsequent contact, noncontact or control, the child was sent to the hospital when feasible and a spinal fluid examination made to aid in diagnosis. This was done in most of the children among the contacts, noncontacts and controls on whom daily thermometer readings were made and a temperature of 99.2 F. axillary on one day or 99 F. or more on several days was recorded.

⁴ The total number of cases of poliomyelitis in Chicago during 1945, up to November 18, was 233, with 19 deaths. Of these, 230 were hospitalized. In 1943 there were 998 cases and 87 deaths.

RESULTS

Many febrile illnesses, such as measles, mumps, pertussis, coryza, diarrhea, otitis media, vaccine reactions and other illnesses, were detected throughout the city, all in the neighborhoods studied during the summer and early fall. There was evidence that 2 cases of mumps and 1 of measles encephalitis were reported as poliomyelitis during the early phases of our study, but, of course, these are not included in the study. It is of interest to note that in 1 case of mumps encephalitis there was no evidence of parotitis or other local manifestation. This case may be made the subject of a separate report. None of these 3 cases presented paralytic poliomyelitis and it strengthened our decision to include in the study only the neighborhoods in which a paralytic case of poliomyelitis occurred. There was also found, as had been the experience in Walker County, Ala., an enormous variation in the abilities of nurses and physicians in history taking and the necessary detective work essential to establish the chronology or visits and illnesses in the child population. This first paper is limited to a report of those neighborhoods which were investigated and reinvestigated and had additional checks and rechecks by the most experienced and able of the personnel. There are, undoubtedly, uncontrollable errors, particularly of omission in the histories reported, but it is believed that the painstaking work has yielded a body of data of more accuracy than that often reported on experimental animals in laboratories, and better than the usual histories obtained under optimal conditions in some hospitals. In the meantime, a group of trained workers has obtained invaluable experience for further work in the future.

Since the animal inoculations will take considerable time, no report can be made for some time on the many specimens taken from nose, throat, mouth and stool which were collected during the incubation period in patients with febrile illnesses. Several of these were outright clinical cases of poliomyelitis with paralysis. The results of the daily temperature readings are not reported as such here, since this also will be the subject of another report. Suffice it to say that about 60 persons with febrile illness compatible with poliomyelitis were found in the day by day neighborhood studies.

Although investigations were made in the neighborhoods of 7 paralytic cases of poliomyelitis and 9 nonparalytic cases, presumably poliomyelitis, this preliminary report concerns only three patient neighborhoods wherein resided 7 paralytic patients and their respective control neighborhoods, because there has not been sufficient time to tabulate and study all of the data collected. However, we feel that the information is of sufficient importance to justify this preliminary report. Even here the date of reporting in the first case (also first of the 26 reported) was so close to the beginning of our study that much effort for a week or two was made in the training of nursing personnel in the collection of specimens and the taking of temperatures. From the fact that 3 of the paralytic cases were from one family, and 2 of the 4 other paralytic cases were from one side of the same block, it would seem that paralytic cases were more likely to occur in the neighborhood of another paralytic case than in the neighborhood of a nonparalytic case.

The data as to contacts, noncontacts and controls are presented for the neighborhoods of the 2 older patients not completely studied (table 1)⁵ and for the

Shaw and Yates avenue groups (tables 2 and 3). Data are available on the age, sex, color, onset of illness, presence of fever, headache, stiff neck or stiff back, sore throat, constipation, vomiting, paralysis or paresis, running nose, cough and diarrhea, together with the spinal fluid cells.

Cases in which these symptoms occurred together with spinal fluid protein of 45 mg. or more (indicative of poliomyelitis), or those with fever, headache, stiff neck or back and paresis or paralysis are listed as poliomyelitis and placed in group A. There were 24 children in this group with fever, 23 had spinal fluid examinations made and 22 had spinal fluid proteins of over 45 mg., indicative of poliomyelitis. The other child had a bloody tap, which made the fluid unfit for study, and in 1 person spinal tap was not permitted. The febrile illnesses studied were not colds. None of these 24 patients (group A) had a cough; 1 had running nose, and 2 had a slight diarrhea.

In classifying the remaining 266 children studied (including contacts, noncontacts and controls), those children without paralysis or paresis, that is, muscular weakness, who demonstrated either running nose, cough or diarrhea were eliminated from a second group of

Chart 1—Incidence of illness among contacts, noncontacts and controls

children having illness compatible with poliomyelitis and were placed in group B. Into group C were placed children with mumps, pertussis, otitis media, vaccine reactions and indefinite illnesses accompanied by running nose, diarrhea or cough.

There were 224 children who were noncontacts and controls. No case of definite poliomyelitis developed among any of these noncontacts or among the controls (table 4). There were four minor illnesses of the sub-clinical variety considered compatible with poliomyelitis but not diagnosed as such. There was no difference, as far as incidence of poliomyelitis or febrile illnesses compatible with poliomyelitis is concerned, between the children in the same block as the patient who were noncontacts and the control children who lived ten to fifty blocks distant (chart 1). Yet the noncontact children in the same block as the poliomyelitis cases were exposed to the same flies or other insects, water, milk and other food supplies as the patients and contacts. On the other hand, in addition to the 24 cases of poliomyelitis among the 66 contacts, 13 children, or 20 per cent of the contacts to poliomyelitis cases, developed febrile illnesses which, although not definitely clinical poliomyelitis, were compatible with this disease (chi square = 87.3; $N = 1$; $P = 0.001$ —, significant). These differences were true for

⁵ Tables are included in reprints, which will be sent on request.

each of the three neighborhood groups studied both as to the incidence of frank poliomyelitis and as to the incidence of minor illnesses compatible with poliomyelitis (table 4).

When the incidence of febrile illness compatible with poliomyelitis and the cases of definite poliomyelitis in contacts, noncontacts and controls were plotted according to age groups, no peak occurred among the noncontacts and controls, whereas there was a sharp peak among the contacts, reaching 90 per cent in the $1\frac{1}{2}$ to $3\frac{1}{2}$ age groups, tapering off with the older groups (tables 4 and 5, chart 2). No poliomyelitis or illness compatible with poliomyelitis was recognized in any child under $1\frac{1}{2}$ years of age whom we studied.

COMMENT

The incidence of febrile illnesses compatible with poliomyelitis among contacts in the $1\frac{1}{2}$ to $3\frac{1}{2}$ age group is about the same as that observed in Walker County, Ala., in the epidemic of 1941. However, the tapering off of the curve was less definite in the Chicago area than was noted in Alabama. This might indicate that the children in Walker County, Ala., were more

Chart 2.—Illness according to age groups.

commonly exposed to infantile paralysis in the younger age groups than was the case in Chicago or that more detailed studies of indefinite illnesses in the older children were employed in Chicago, bringing more cases of poliomyelitis to light.

The apparent contagiousness of poliomyelitis in an epidemic year in a rural community compared with a nonepidemic year in a large modern city would seem to demonstrate that poliomyelitis is a very contagious disease among young children. Presumably the older children may have actually had the disease or may have developed an immunity in some other way.

It should be pointed out that of the 24 children diagnosed as having poliomyelitis and having spinal fluid findings, such as elevated protein, sufficient to confirm a profound reaction in the central nervous system, 7 were paralytic. If to these 24 are added the 13 other children living in the same block, exposed to poliomyelitis and developing a minor illness compatible with poliomyelitis, 1 child in 6 who develops poliomyelitis may be expected to have paralysis. Fourteen of the 37 (38 per cent) developed stiff neck or stiff back recognized by history or physical examination after an intensive study.

Until some method of diagnosis, such as a serologic or other inexpensive laboratory test, is available, perhaps it would be well to make a definite diagnosis of poliomyelitis in those children with no paralysis only if they have fever, spinal fluid protein over 45 mg. and were contacts living within a block of a paralytic case of poliomyelitis. This might obviate the mistaken diagnosis of poliomyelitis in other virus diseases, such as mumps, which may closely simulate poliomyelitis. In addition, it would help lead to a diagnosis in most of the 62 per cent of subclinical cases of poliomyelitis not now recognized or reported as such. Since many of those listed as minor illnesses compatible with poliomyelitis were children without spinal fluid protein determinations, and since in another publication it will be reported that the spinal fluid protein is high in these children with minor illnesses, compatible with poliomyelitis, three to six weeks after the onset of illness, spinal fluid examinations could be more widely used in clinical practice by hospitalizing suspects in a hospital where the tests can be adequately performed.

The possibility that the daily visits by our nursing personnel may have introduced the virus can be dispelled by studying the dates of onset (tables 1, 2 and 3). At the time our studies were instituted, 24 of the 37 children had already developed their febrile illness and all who were going to come down with the disease had already been exposed. It is possible that the intensive study actually limited the spread, and there is no evidence to support the presumption that a single case in the groups herein reported was brought in by the medical personnel. Needless to say, unusually strict and careful techniques were employed. These will be more fully explained under the virus studies now in progress, and it should be pointed out that stool, nose, throat and mouth specimens are available on nearly all of the children herein reported.

This study throws some light on the possible role of insects as against human contact in the spread of poliomyelitis. It is believed that these studies point to which of these two is the major role involved once the virus is introduced into the neighborhood. Of the noncontacts living in the same block as the patients, none developed poliomyelitis and there were no more minor illnesses compatible with poliomyelitis than were found in the control neighborhoods ten and fifty blocks distant. On the other hand, 20 per cent of the contacts developed the disease. The studies would indicate that poliomyelitis for children $1\frac{1}{2}$ to $3\frac{1}{2}$ years of age is as contagious as measles, mumps or other better known contagious diseases. There were flies of the orange and green variety seen about garbage cans in the alleys of Chicago during the summer of 1945, but there was no significant difference between the presence of these flies in poliomyelitis neighborhoods and in the control neighborhoods where the disease did not appear. In fact, the two neighborhoods where most of the patients with poliomyelitis in this study resided were almost entirely free from flies and had cement garbage disposal boxes and the latest fecal disposal systems and sewerage. Again it would attribute too much intelligence to the fly and other insects to select in a given block only those children who had been in contact with the patient during the infectious period, to transmit the disease, and intelligently avoid those children in the same block who had not been in contact with the patients. Such an assumption would seem to carry insect intelligence too far.

The following case histories indicate the relationship of various cases of poliomyelitis to one another:

In the Shaw neighborhoods a boy aged 9½ years (TARoIsa, table 2) attended a summer camp in Wisconsin in the last week of June, returned home on July 8, became ill on July 15 at his home, and there exposed on that day his 10 year old first cousin (TAPaSha, table 2) who played with him that day but who was not with him before or after or within 3 miles of him during the rest of the summer. The ten year old cousin went back home to her neighborhood and became ill eight days later. Four and five days after her onset and seven and eight days after exposure to her during her assumed infectious period her 2 sisters (TAKaSha and TAJeSha) became ill. Playmates of the 2 sisters (TACHOrr and TADoNei) became ill with poliomyelitis twelve and thirteen days later. On the day that her 2 sisters were becoming ill (July 27) a younger brother, William (TAWiSha), aged 7 years, and a young nephew, Leonard (TALeLaf) 1½ years, who had spent the entire summer before and after this time with the grandparents in a still different part of Chicago, visited the Shaw home on July 27 when the 2 sisters were in their most infectious period and played with these 2 for a period of hours, hugging and kissing them. Nine days later William and ten days later Leonard became ill with poliomyelitis, William being paralytic and Leonard having an illness detectable only by daily temperature thermometer readings and a spinal fluid examination.

Similar relationships existed in the other neighborhood intensively studied, in which the first child (TADiKaw), aged 7 years, became ill on July 22, and 6 of her contacts became ill between August 1 and 6, which was ten to fifteen days later. Children exposed to these contacts became ill eleven to seventeen days later.

Making the most of fragmentary or indirect evidence, many workers had been successful in approximating the incubation⁶ and the infectious⁷ periods in poliomyelitis and had concluded that the disease was contagious.⁸ However, it was not until the fortuitous occurrence of an intense rural epidemic that sufficient direct evidence could be compiled.² These observations were quickly confirmed as to the incubation and infectious periods,⁹ but the 80 per cent patient to patient contact rate noted in Alabama has not been duplicated except in the Chicago studies here reported. In fact, studies generally have not shown a patient to patient contact rate in poliomyelitis of more than 15 to 30 per cent.¹⁰ The difference lies perhaps in the painstaking detective work on and the carefully prepared histories of minor illnesses not hitherto catalogued as poliomyelitis but most of which in the present studies were checked by either daily thermometer readings or retrospective spinal fluid examinations or both. There was almost no necessity to assume, in either Walker County or Chicago, that poliomyelitis had been transmitted through persons not clinically ill with the disease.

SUMMARY

Among 66 persons in contact with poliomyelitis cases during the infectious period, 37 developed illnesses within six to fifteen days afterward which were compatible with poliomyelitis, and 24 were definitely diagnosed as poliomyelitis. Among 109 other children of the same age, who resided within the one block of the patient but who had not been in contact with the patients during the infectious periods, 4 developed illnesses compatible with poliomyelitis and not one was a clinical case.

Among 115 children in control neighborhoods of the same age as the contacts and noncontacts but who lived ten and fifty blocks distant from the poliomyelitis neighborhood and who were apparently without contact with a clinical case, 5 developed illnesses compatible with poliomyelitis and not one was a clinical case. There was no statistically significant difference between the noncontacts and the controls in this respect, but a highly significant difference between these two groups and the contact group.

CONCLUSIONS

1. Multiple cases of poliomyelitis in the family were the rule rather than the exception when there were other children from 1½ to 8½ years of age in the home.

2. Poliomyelitis was found to be contagious perhaps to the degree of 90 per cent in the 1½ to 3½ age group but less infectious in the older groups.

3. There was no evidence that flies and other insects played a major role in the spread of the disease in the neighborhoods studied, once the disease had been introduced.

4. Only about 1½ out of 6 instances of poliomyelitis would have been diagnosed as such, even under an alert public health reporting system, without an intensive neighborhood study. Illness in the other cases of poliomyelitis was so mild in most instances that a physician was not consulted.

5. Paralysis developed in about 1 case in 6, and about 2 in 6 could be confirmed only by animal inoculations or by spinal fluid protein examination done two to seven weeks after onset.

6. Poliomyelitis in the cases studied was usually a very mild condition, but in every instance there was sufficient systemic disturbance to account for a thorough immunization. Even in the mildest cases the spinal fluid protein was elevated above 45 mg. two to six weeks after onset.

7. Earlier observations by Casey, Aycock, Kessel and Gordon on the infectious and incubation periods are confirmed, and the original high percentage of patient to patient contacts noted in a rural epidemic have been substantiated by finding the same conditions in a large urban area like Chicago in a nonepidemic year.

8. Present methods and criteria for the diagnosis of the disease must be revised.

Virus Survival.—Control of virus disease in the future, as in the present, must depend wholly on an accurate understanding both of the mode by which the virus survives and of the process by which symptomatic disease is produced. When such knowledge is available, it is usually possible to see either that effective action can be taken at some point in the life history of the virus to eliminate the chance of human infection or that the virus cannot be dealt with in this fashion. In the latter case, the aim changes to that of preventing symptomatic infection after the virus has entered the body either by ensuring an immunological resistance through artificial immunization carried out before exposure to the virus or by other means still to be devised.—Burnet, Frank MacFarlane: *Virus as Organism*, Cambridge, Mass., Harvard University Press, 1945.

TREATMENT OF PREPARALYTIC POLIOMYELITIS WITH GAMMA GLOBULIN¹

ANNE M. BAHLKE, M.D.

AND

JAMES E. PERKINS, M.D.

ALBANY, N. Y.

By July of 1944 it was obvious that New York State was about to experience a major epidemic of poliomyelitis. Dr. John B. Alsever of the U. S. Public Health Service, temporarily assigned to the New York State Health Department in connection with the development of its plasma program, saw in the situation an excellent opportunity to study the possible therapeutic effect of the gamma globulin fraction of pooled plasma¹ in poliomyelitis. At that time collaborators of Enders² had already reported finding poliomyelitis antibodies in fraction II + III of human plasma in concentrations ten times as great as in whole plasma. Moreover, it was found that a number of other antibodies, similarly concentrated four to ten fold in fraction II + III, were associated with the gamma globulins, since they were further concentrated³ fifteen to thirty fold over plasma in fraction II,¹ which contains 80 to 95 per cent gamma globulin in different commercial preparations.³ It seemed reasonable to assume, therefore, that the concentration of poliomyelitis antibodies would be appreciably greater in fraction II alone, from which commercial gamma globulin is prepared. This assumption has been borne out by an extensive and painstaking series of titrations by S. D. Kramer.⁴ These experiments, as yet unpublished, indicate that neutralizing antibodies against the Lansing strain of poliomyelitis virus are present in fraction II at an average concentration eighteen to twenty-five times as high as in the corresponding whole plasma.

The present work basically constituted a repetition of the convalescent serum studies, and from the reports of the three recorded studies of this sort in which establishment of a control series of cases was attempted⁵ there seemed little reason to be hopeful. However, with the much larger dosage of antibody theoretically available in a given volume of gamma globulin it was conceivable that a favorable result might be obtained. The question clearly needed to be investigated and the situation for doing so looked very promising. Accordingly a plan to study the therapeutic effect of gamma globulin in poliomyelitis, with a request for allotment of sufficient material, was submitted to the Technical Advisory Com-

mittee of the American Red Cross, which at that time controlled the national gamma globulin supply.

This committee approved the study as outlined and agreed to release enough material to carry it to a significant conclusion. Its approval had but two provisos—that, contrary to the plan as submitted, only preparalytic cases be included in the study, and that we be advised throughout by a special committee consisting of Drs Edwards A. Park, Charles A. Janeway and Ernest L. Stebbins.⁶

The two major foci in the epidemic were in the Elmira and Buffalo areas, and it was decided to confine the study to two hospitals in each of these regions. There are only two hospitals in Elmira, the Arnot-Ogden and St. Joseph's, and essentially all patients of any age with poliomyelitis were being cared for in them by the two licentiate pediatricians in the city. Of the several hospitals in Buffalo, the two chosen were Children's, because it was bearing the brunt of the epidemic for the city as a whole, and Meyer Memorial, because it was receiving a fair number of adult patients. The project was presented to the various staff physicians concerned at each hospital, and all expressed themselves as willing to cooperate to the fullest extent.

As has already been noted, the idea was conceived in July, and all the necessary groundwork had been laid early in August. Because of complexities of production, however, the pharmaceutical company which was assigned the order for the gamma globulin was unable to fill it immediately, so that the material was not received until August 20. Consequently the study was not launched until August 22 in Buffalo and August 23 in Elmira.

All the staff men concerned gave their assurance that it would be feasible to enroll every preparalytic case in the study strictly according to plan regardless of whether they happened to be private or service cases, and in actual practice there was only one exception. In Elmira a nurse who had been working in the poliomyelitis wards and had seen the injections developed the disease and should have been in the treated group, but she refused to have the treatment and so had to be interchanged with a 4 year old girl who came in five hours later. All other cases were enrolled alternately without exception as treated and controls in the order of their admission to each individual hospital. The field team checked on every poliomyelitis admission and reviewed the hospital charts regularly for the clinical condition at the time of admission. These records show that every case which was unquestionably preparalytic poliomyelitis according to the stipulated criteria was included in the study.

The criteria for preparalytic poliomyelitis were established by the special advisory committee and were twofold: (1) the cerebrospinal fluid of the patient was required to contain more than 10 cells per cubic millimeter and (2) there could be no definite weakness of any major muscle group and no evidence of facial, pharyngeal or respiratory involvement in a patient who otherwise presented a clinical syndrome indicative of poliomyelitis. Every one concerned, including the committee, felt that the stipulation of a minimal spinal fluid cell count of 11 was regrettably arbitrary, but it was agreed on as necessary to substantiate the diagnosis and

prevent the otherwise inevitable subsequent criticism that probably some cases that were not poliomyelitis had been included. Actually the typical paralytic disease developed later in a number of cases excluded from the study because of cell counts under 11.

Each patient was seen on admission by one of the resident or attending physicians, and if there was no

* Based on titrations of antibodies against the Lansing strain of poliomyelitis by Dr. S. D. Kramer.

clinical evidence of paralysis the case was referred for a detailed muscle grading. This was done promptly by a specially assigned registered physical therapist on twenty-four hour call, who was required to commit herself immediately on the completion of her examination as to whether she thought there was any definite weakness of a major muscle group. If she found none, and if the total cell count of the cerebrospinal fluid which had been examined meanwhile was over 10, the case was considered suitable for inclusion in the study.

Patients due to be treated received gamma globulin intramuscularly in accordance with the dosage schedule presented in table 1. It was felt that it was probably important to give the total dose as soon as possible. For that reason it was stipulated that each patient receive his full quota all at once, and that condition was met in every case. The dosage schedule was prescribed by the special advisory committee and was made as large as they thought could be tolerated by an intramuscular route. An age scale was employed rather than a presumably more accurate one based on body weight because of the practical difficulty of obtaining those weights by hospital staffs already harassed almost beyond endurance. It was suggested that the full dose be divided preferably into not more than four portions injected into the anterior thigh muscles and buttocks. In no case were more than four sites required and actually many of the patients were able to take the dose in two or three portions.

Patients that fell into the control group were followed exactly as the treated ones, but they received no injections. The original plan was to give the controls normal serum or isotonic solution of sodium chloride. The special advisory committee decided against this plan and in favor of no injections because it felt that a better control would be obtained by the latter method and it questioned the importance of the psychologic aspects of control injections. The clinicians in charge of the cases were sure that omission of control injections would not lead to any selection of cases; accordingly uninjected controls were used.

One week after admission, again one week after that, and finally five to seven months from onset the muscle gradings were repeated on all patients, always by the same physical therapist who had made the initial grading. Three physical therapists were employed in all, one at Children's Hospital where the great majority of the

data were obtained, another at Meyer Memorial Hospital and the third at the two Elmira hospitals. All three of these technicians are highly skilled, all follow essentially the same method of muscle examination and all used the same form to record their results. This form, which is the one currently used for muscle grading by the Medical Rehabilitation Division of the New York State Health Department, lists fifty-three individual muscles or functionally related groups. All fifty-three were checked each time except in a few patients who were too sensitive to grade on the second or third gradings. The condition of each muscle or group was evaluated as normal, good, fair, poor, trace of power or totally paralyzed.

It would have been ideal if the physical therapists could have been kept in complete ignorance as to which patients were treated and which were controls, but this possibility was lost when it was decided not to use a control injection. An earnest effort was made at the very outset, however, to inculcate them deeply with the idea that the value of the agent under investigation was entirely unknown, that there was no more reason to anticipate a favorable effect than a negative one, and that it was positively essential, if the efforts of every one were not to be wasted, that unbiased data be obtained. They were cautioned, moreover, not to attempt to refresh their memories if they should forget from one examination to the next which patients were treated. They kept the grading forms with them until the study was completed, so that it was not necessary for them to refer to the hospital charts to make their entries, and they had no access to our special case cards with a detailed record of treatment. As a result of all this—and this is particularly true in the case of the one technician who had 89 of the patients—the physical therapists were not aware for the most part which patients received treatment and which did not.

100-199	12	14
200 and over.....	6	7
Received hot packs	47	43

The study was begun, as already stated, on August 22 in Buffalo and on the 23d in Elmira. It was not continued for a comparable interval in all four hospitals, however. By September 13 the admission rate had fallen so low at Meyer Memorial Hospital that the returns were not sufficient to justify the expenditures involved, so that no patients were enrolled in the study in that hospital after that date. By September 25 the same situation had developed in Elmira, and further

expansion of the study was discontinued. At Children's Hospital the admission rate stayed up appreciably longer, and termination was not indicated until October 19.

During these respective periods a total of 112 patients were enrolled, 90 at the Children's Hospital, 8 at Meyer Memorial and 14 in Elmira. In this total there was apparently only one mistaken diagnosis, in a control child at Children's Hospital who was subsequently found to have tuberculous meningitis and who has been excluded from the data.

On the basis of our knowledge of the actual working conditions of the experiment in the two Buffalo hospitals we feel justified in considering the patients from both as a single group, and the results have been so tabulated. Because of the violation of strict alternation of cases in the Elmira group, and also because the physical therapist there seemed to interpret the gradings

or functionally related groups. For the calculation of the index, some additional combinations were made based on two factors: (1) spinal nerve innervation of muscle groups and (2) advice from the physical therapists as to the fineness with which they could distinguish between the functioning of various muscle groups. Thus all the flexors of the hand were combined in one group, all the small muscles of the hand in another, and so on to a total of thirty-five separate items. The various degrees of muscular involvement as noted by the physical therapists were given progressive numerical values, with normal = 0, good = 1, fair = 2, poor = 3, trace of power = 4 and total paralysis = 5. Where muscles were grouped, the total value for the group was divided by the number of muscles making up the group and the figure obtained was added with all the other separate values to produce a single numerical value for the body

* Regarded as interval from onset to hospitalization in control cases.

† Including 1 fatal case.

during the acute stage of the disease somewhat more rigidly than the other two workers, it was thought best to consider those 14 cases separately, and they will be presented briefly after the Buffalo data.

Table 2 was compiled to test the comparability of the treated and control groups of cases with regard to certain fundamental factors: month of onset, sex, age, interval from onset to hospitalization, spinal fluid cell count and hot pack therapy. Inspection of the figures discloses the fact that the two groups, with the aforementioned case of tuberculous meningitis omitted from the controls, are strikingly similar with respect to every criterion listed. It seems justifiable to conclude on this basis that the study was adequately controlled, and there is no reason to assume that the comparison of treated cases and controls is any less valid where the data on muscle gradings are concerned.

The results of the muscle gradings were expressed in terms of a numerical index. It will be recalled that the grading form itemized fifty-three separate muscles

as a whole. According to this scheme the maximum index possible with each muscular item showing complete paralysis would be 350.

This method of course does not indicate the actual disability of the patient in functional terms, but it does express the disability in somatic terms; that is, in terms of the number of segments of spinal cord involved and the degree of that involvement. This claim seems sound, as muscles were grouped only when they were supplied by the same segments of cord. And for the purposes of this study it is the somatic involvement which is significant, since any significant effect of the agent under investigation would be expressed as the ultimate effect of the virus on the central nervous system.

Table 3 shows the grading results expressed as the numerical index of paralysis, with the treated and control groups broken down according to this index on the second, third and fourth examinations. The results on the first examination are omitted, since all cases had a zero grading at that time by virtue of the basic con-

ditions of the study. Viewed even in terms of individual cases the results are clearcut, but to simplify presentation the indexes were grouped as noted in the table. It is readily apparent from the table that treated and control cases are of essentially equal distribution in each paralysis-index group.

The patient with the highest index in the study (169 on the second examination and 163 on the third) happened to be in the treated group. This child was inaccessible for the six months follow-up because he had moved out of the state, but it was learned at that time through relatives that he still had definite involvement of all four extremities.

Of the other cases classified as "grading not obtainable," all except the fatal case had to be omitted on the second examination because of hyperesthesia of extreme degree. The muscles of 1 of these patients were still too sensitive for grading at the time of the

Results of muscle gradings, Buffalo 1944.

third examination. The other patient missed on the third examination was an air force cadet who was considered well enough for discharge to the infirmary at his base before the grading was due, and the military authorities declined permission for the physical therapist to follow him at the base. On the second grading he had only minimal involvement of the left shoulder with an index of paralysis of 3, and at the time of his discharge from the hospital he was regarded clinically as having no residuum.

With the obvious exception of the fatal case, all those missed on the fourth grading had moved to some point too far from Buffalo to be reached by the physical therapist.

Certain clinical details regarding the 1 patient who died warrant special mention. This child appeared critically ill to the resident at Children's Hospital when she first saw him in the admitting room, and she had a presentiment that he might be a bulbar case. Since she and two other house officers were unable to detect any signs of facial, pharyngeal or respiratory involve-

ment, however, he was admitted to the study in the proper order as a control case. Within one and one-half hours of his transfer to the ward he developed definite respiratory embarrassment. The next day there was a rapid progression of symptoms, and the day after that, forty-eight hours after admission, he died.

TABLE 5.—*Criteria of Comparability*

Had hot packs	7	6

The negative quality of the results in table 3 is emphasized by the percentage distribution also presented there, and it is rendered even more striking by the chart, in which these percentage values are shown in graphic form.

Despite this negative outcome for the group as a whole, consideration was given to the possibility that the therapeutic agent might be of some benefit in early cases. To test this possibility table 4 was prepared, with the patients divided according to whether they were treated within four days of onset or later. Here again the equality of numbers in treated and control groups is striking at each index level, and it is obvious that patients who were treated early in the course of their disease were no better off than those treated late.

With 97 cases from Buffalo as a background, the Elmira cases merit some consideration even though they numbered only 14. The comparability data on them are presented in table 5. It will be noted that even with

TABLE 6.—*Results on Fourth Muscle Grading*

† Not available for fourth grading but information by correspondence claimed complete recovery.

such small numbers the treated and control groups are apparently quite comparable with respect to the factors considered, with the possible exception of somewhat higher spinal fluid cell counts in the treated group.

Table 6 shows the results in 12 of the 14 cases on the fourth muscle gradings. The second and third gradings were not tabulated because of the physical therapist's tendency to make numerous qualifying notations

on her records. This made it difficult to evaluate her findings and reduce them to a numerical index. For the fourth grading, however, when the muscles were no longer hypersensitive, the records are concise and could be coded in accordance with our scheme. From this coding, as presented in the table, it is clear that the 7 treated patients were not benefited by the treatment.

In summary it can be conclusively stated that, in a series of 111 patients with paralytic poliomyelitis observed for approximately six months after onset, no benefit is detectable when 56 of them who had received large doses of gamma globulin intramuscularly in the paralytic stage are compared with 55 alternate, untreated controls.

As a corollary to the foregoing conclusion, these data compiled with gamma globulin offer further indication that serum in any form is, for all practical purposes, ineffective in the therapy of poliomyelitis. This is evident from the comparison of dosages in terms of poliomyelitis antibodies in gamma globulin and whole plasma presented in table 1. These values are for normal adult plasma collected without reference to an antecedent history of poliomyelitis, but there is no definite evidence that the concentration of neutralizing antibodies against poliomyelitis virus is any higher in convalescent serum than it is in normal pooled adult plasma.⁷

A STUDY OF THE ORIGIN OF AN EPIDEMIC OF POLIOMYELITIS

MARTHA L. SMITH, M.D.

EDWARD M. BRIDGE, M.D.

HELEN E. UNDERWOOD

AND

GRACE E. DALE

BUFFALO

Few reports have been published concerning the sources of the initial cases of poliomyelitis in a large and widespread epidemic, although many investigators have demonstrated the radial spread of the disease from established epidemic areas. Wickman¹ focused attention on a parish school as the possible common source of some of the early cases in the Swedish epidemic of 1905, but he offered no suggestion as to how the infection entered the school prior to the first clinical case. In 1911 Kling and Levaditi² reported that an immune carrier was probably responsible for the introduction of the disease into two small islands off the coast of Sweden. However, in view of present day knowledge, this circumstance is probably not significant since at that time the incubation period of poliomyelitis was erroneously thought to be from two to three days.³ The 1916 epidemic in New York City and environs presented additional evidence to support the thesis that the disease spreads by person to person contact, but

again there was no clue as to the source of the early cases. In several communities, however, an important observation was made, namely that in a previously uninfected area the first recognized case may have had no contact with a clinical case of poliomyelitis from the epidemic areas. Furthermore, in several instances the epidemic was ushered into a new community by several simultaneous, widely separated cases having no possible direct contact with one another.⁴ The obvious conclusion was that during an epidemic period the reservoir for the spread of the virus was not confined to the paralytic cases. Today this is well accepted fact.

In recent years increasing emphasis has been placed on the importance of abortive forms and healthy carriers of the virus in the spread of the disease from person to person and community to community.⁵ Although since the studies of Wickman the existence of such foci of spread has been repeatedly discussed, no observations have been made concerning the role played by such circumstances in the outbreak of a fresh epidemic. In spite of a large body of data supporting the thesis that very mild or abortive forms may be the source of the paralytic cases of the disease, discussions of the origin of epidemics have emphasized the environmental and sanitary factors. Lumsden,⁶ in his report of the 1941 outbreak in Mississippi, stressed specific environmental factors as a background for the outbreak of the disease rather than person to person contact. Similarly, Casey⁷ hypothesized that the first patient and many sporadic cases in the Walker County, Alabama, epidemic of 1941 were exposed to stagnant waters, polluted from an epidemic area. Ward and Sabin,⁸ during a cold winter, isolated the virus from the intestinal contents of 2 patients with poliomyelitis and from a healthy sibling of each. One of the healthy carriers was found to be harboring the virus as long as six months later. Although drawing no conclusions, they inferred that during the interepidemic period patients and healthy carriers may be the reservoirs for virus which may in some way become disseminated.

At the present time the known facts are insufficient to permit conclusions to be drawn regarding the relative importance of environmental and human reservoirs in the initiation of a fresh early summer epidemic. This study was undertaken, therefore, to determine the role which human reservoirs, in the guise of healthy carriers or unrecognized illnesses caused by the virus, may have played in the origin of the first paralytic cases of poliomyelitis in the 1944 epidemic in the Buffalo area. Thus, two pertinent questions presented themselves:

1. Why did 3 almost simultaneous cases suddenly appear in a rural township in which no previous cases had been known for fifteen years?⁹

7. Rivers, T. M. Immunological and Serological Phenomena in Poliomyelitis, Lecture 3, p. 59. Infantile Paralysis, National Foundation for Infantile Paralysis, Inc., 1941.

The study was aided by a grant from Kart's Dairy, Inc. of Buffalo. From the Department of Pediatrics of the University of Buffalo School of Medicine and the Statler Research Laboratories of the Children's Hospital of Buffalo.

2. Should the onset of an epidemic be dated from the first cases of paralysis or is its presence obscured by the absence of paralysis or other characteristic manifestations?

DESCRIPTION OF THE BUFFALO EPIDEMIC

During the summer of 1944, Buffalo and its surrounding county (Erie) were the center of the largest outbreak of poliomyelitis in their history, 1,083 cases of the disease, of which approximately 625 were paralytic, being reported. This represented an overall incidence of 1.35 cases per thousand of population.

The first 3 paralytic cases of the epidemic proper developed within the period of May 23-28 in a small rural community about 20 miles south of the city of Buffalo. During the succeeding weeks other cases appeared in the city proper, in the suburbs on the northern side of the city and finally in more distant communities, giving the entire epidemic the characteristics of a disease spread by radial contiguity.

During the preceding year poliomyelitis had existed in the city of Buffalo and its surrounding county, 81 cases having been reported. However, this represented no unusual proportion for the endemic incidence in a community of this size, i. e. approximately 800,000 people.¹⁰

Eleven of these cases occurred during the period from Oct. 1, 1943 to Jan. 3, 1944 and, as shown in figure 1, were scattered over an area within approximately 40 miles of the city of Buffalo. The last 2 cases occurred on an Indian reservation about 25 miles south of the site of the next case, which was the first reported in the 1944 epidemic. However, an interval of five and one-half months elapsed between these illnesses. The proximity of these late fall and early winter cases to the site of the first recognized case of the following summer leads one to suspect that the virus might have been continuously active not far from the community in which the earliest cases of the 1944 epidemic occurred. Furthermore, with the increased travel of war workers back and forth between the city and rural areas the possibility of a person to person spread of the virus certainly existed, with illnesses smoldering over a period of time and finally culminating in a widespread epidemic.

METHODS OF STUDY

Although at the beginning of the 1944 epidemic no one was prepared to conduct an epidemiologic study and many of the facts had to be ascertained at a later date, certain sources of information in the community greatly facilitated the work. Since the first cases developed three weeks before the central school of the township recessed for the summer, the records of school absences furnished an accurate log of a large proportion of the significant illnesses occurring among the child population before actual cases of poliomyelitis were recognized. Fortunately too the school nurse had made immediate inquiry into the reasons for all absences and in many instances had verified these by visits to the home. The nature of the illness or reason for the absence was therefore available from this log in simple terms, such as, cold, "grip," stomach upset, sore throat. A worker from the research staff, with the knowledge of the dates and general natures of the illnesses, interviewed approximately 200 of these

patients, frequently bringing to light additional facts and concluding with clear pictures of the characters of the illnesses. This knowledge proved of great value in studying the early phases of the epidemic.

In order to obtain similar information during the summer recess while the epidemic was at its height, a questionnaire was distributed to each school child as soon as the fall term began. On these the parents recorded the dates and symptoms of any illnesses which had occurred during the period. In this survey, which came at a time when the community was still alarmed by the epidemic and anxious to cooperate in any forward step, additional data were obtained concerning the minor illnesses in the mid and latter phases of the outbreak. Ultimately the entire material relating to community illnesses was transferred to punch cards and sorted by type of illness and week of occurrence.

In addition to these sources of information relative to the minor illnesses in the community, a detailed study was made of the contacts of all paralytic cases in an attempt to trace down the source of each. Special attention was given to the first 3 cases, all of which

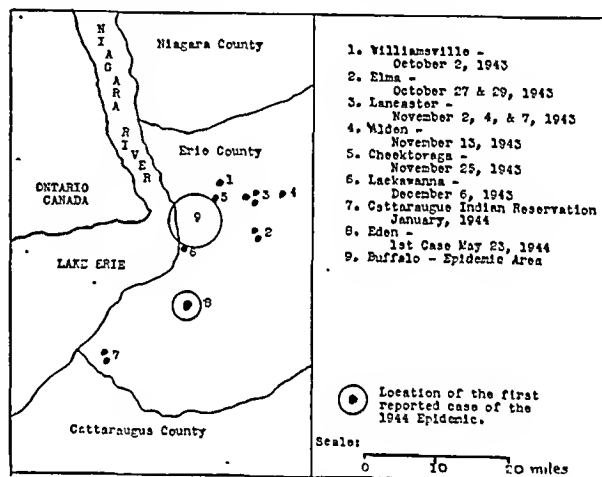

Fig. 1.—Location of cases of poliomyelitis in the greater Buffalo area during the period of eight months preceding the first reported case in 1944. Each dot indicates a case of poliomyelitis.

developed within a period of five days. After ascertaining the activities and habits of the children who acquired the disease, any suggestive illnesses among the contacts could be verified from the records that have been discussed. Activities in four categories were considered: (1) home and neighborhood, (2) school grade, (3) school bus and (4) church. By correlating information from all sources, a satisfactory overall picture was obtained of the health conditions in the community from which the entire epidemic in the area seemed to radiate.

STUDY OF THE FIRST THREE PARALYTIC CASES

At the beginning of the investigation the problem of ascertaining, if possible, a source for the first cases presented itself. This was particularly intriguing since the 3 earliest cases developed within a period of five days and the disease could not, therefore, have been acquired from one another. The study brought to light interesting facts relative to the origin of the earliest cases of paralysis, and these facts pertained to the origin of the entire epidemic as well.

PATIENT I.—A preschool child aged 4 was reported to the department of health with onset on May 23,

10. The Bureau of Census of the United States Department of Commerce, dated Feb. 15, 1944, estimated the population of Erie County, N. Y., as 798,377. The city of Buffalo comprises about 75 per cent of the population of Erie County.

1944. His family is designated A in the following discussion. His father, a repairer of farm machinery in the community, owned a small farm 3 miles from the nearest village. Two older sisters aged 12 and 7 and a twin brother aged 7 went by school bus to the central school. A baby sister and the mother were at home.

Several hundred yards away lived their only intimate neighbors, family B, composed of a mother with 2 children, 1 preschool aged 4 and the other aged 6. The latter used the same school bus as family A. These two families visited each other daily, and once a week the mothers went marketing together accompanied by the 3 preschool children. Aside from these weekly trips to the village, patient I had no contacts except with the 9 members of these two families.

Other members of these family groups had more widespread associations. The 4 school children traveled each day on bus 1, which, owing to wartime restrictions, was decidedly overcrowded. They attended kindergarten, first, second and fifth grades at a central school which had an enrolment averaging about 750. On the playground and in special shop and gymnasium classes they associated with children from other grades. In

a third family, family C, living half a mile away, were 5 children all but 1 of whom rode on bus 1. The 2 girls in family C came occasionally to the A house to play with the 12 and 7 year old children. No other contact with family C is admitted. Two other families lived across the road from family A but neither had children nor any contact with family A, B or C. It is entirely probable, therefore, that if patient I acquired his poliomyelitis from a human reservoir the source must have been 1 of the 9 members of families A and B. The known facts contain no information relative to environmental factors as a source for the disease in family A except that analysis of water from a well located not far from the barn showed it to be "unsafe" for drinking. Their toilet was in the cellar and emptied into a cesspool in a field at least 150 feet from the house and well.

Among the 9 contacts of patient I, 8 were known to have had an illness of some kind during the three months preceding the recognition of poliomyelitis in the group. Figure 2 presents these illnesses in simplified form. Six of the patients had rather widespread outside contacts and might have been concerned not only with the origin of the first paralytic case but also with the spread of the epidemic. The following is a description of these illnesses:

1. Sister, aged 7, was sick March 6-9 with fever, "cold" and headache, which was so severe that she cried out frequently from the pain. A search among her friends and acquaintances and a check on the school absence lists failed to reveal a likely source of this illness.

2. Twin brother of the preceding child was sick March 20-23. The symptoms were fever, sore throat and a "cold," which were so severe that for a time pneumonia was considered. It appeared probable that he had acquired the infection from his twin sister and that the incubation period was approximately two weeks.

3. Baby sister, aged 2, was ill March 23-25 with symptoms of "a very bad cold." Since she was too young to have had significant contacts outside the family, it seemed likely that she too acquired the infection from the older sister (1). Contacts between these two were less intimate than between the twins (1 and 2), and if contact was assumed to have taken place toward the end of the illness of 1 the incubation period would again be approximately two weeks.

4. Sister, aged 12, was ill April 3-5 with a sore throat. Since she was in daily association on the school bus and at home with 1 and 2 and had little time for play with her baby sister (3), the brother (2) seems to be the more likely source. Again the incubation period appears to be about two weeks.

5 and 6. The mother and father both had symptoms of a "bad cold," felt miserable and had mild diarrhea, the illness lasting three or four days. This occurred about the first week in April, but there was no way of verifying the exact date. The probable source was the youngest child, and therefore the incubation period was approximately two weeks.

7. Mrs. B, intimate neighbor, was ill April 23-27. She complained of a "heavy cold" with fever, dizziness, severe headache, severe pains in the legs and moderate diarrhea. This occurred approximately two weeks after the illness of Mrs. A.

8. Son of Mrs. B., aged 6, was ill May 8-16 with "cold," fever and some diarrhea. Although attending kindergarten and riding on the same bus as the children from the A family, he had not yet acquired intimate friends in school. He had been, however, in close contact with his ill mother (7) two weeks before and according to school records had been kept home on April 25 to take care of his mother.

9. Patient I, the 4 year old member of the A family, developed poliomyelitis with prodromal symptoms beginning on May 23, 1944 and sudden leg paralysis on May 25. On May 12 the 6 year old neighbor (8) had felt better and had gone with his mother and sister to a birthday party at the A home. No other outsiders attended. This first case of paralytic poliomyelitis had its onset of prodromal and paralytic symptoms eleven and thirteen days respectively after this gathering. All during the period of preceding illnesses in the families A and B, child 9 had not developed any symptoms in spite of his close association with each illness. At the time his parents considered this extraordinary. His poliomyelitis climaxed the series of illnesses, and thereafter no one was ill in either family, although the epidemic of infantile paralysis and "grip" raged throughout the community for the succeeding three months.

10. No symptoms are known to have occurred in the 4 year old preschool member of the B family who was a constant playmate of child 9. One can only conclude that this child either had symptoms so mild as to have passed unnoticed or acquired immunity without symptoms of any kind.

Family C, whose contacts with family A were limited to infrequent visits between 2 children from each home, had no illnesses or absences before the first case of definite poliomyelitis. However, simultaneously with this illness 2 girls of the C family were sick for a week with symptoms suggestive of poliomyelitis—fever, headache, vomiting, dizziness and pains in the muscles of the neck, back and legs. Two other members of the family were ill several weeks later.

In summary, patient I developed paralytic poliomyelitis at the end of an eleven week period during which 8 of his 9 associates had illnesses with incubation periods of approximately two weeks. At least one of these

illnesses (7) was highly suggestive of so-called abortive poliomyelitis. The symptoms of the others could not be distinguished from common winter respiratory infections. Circumstantial evidence would suggest that these illnesses represented mild forms of poliomyelitis and were followed by definite paralytic symptoms in the 4 year old child. The incubation period of approximately two weeks is distinctly different from that of common respiratory diseases with which abortive poliomyelitis is most likely to be confused. Judging from this study one would postulate that the poliomyelitis virus had been active in the community for at least eleven weeks prior to the first paralytic case of the disease.

PATIENT II.—A boy aged 9 years lived in a rural but less isolated section of the township than patient I. His family consisted of the father, a worker in a nearby airplane factory, mother and sister aged 5. Within an easy walking distance of their farm were homes of a few children who rode on the same overcrowded school bus, No. 2. At the central school of the township he attended the third grade and in addition had contacts with other children on the playground and at lunch. Contacts of patients I and III attended the same school but traveled on different busses. At home he usually played by himself, but occasionally at a nearby creek he came in contact with several children who associated with patient III. This child had no church affiliations, and therefore his contacts were limited to the school bus, the school and a few children at home. In general, however, his companions and contacts were more numerous than in the preceding case.

Although the setting in this case is too complicated to determine a single source for his poliomyelitis, the general picture of known illnesses among the neighborhood, on the school bus and in the class room is not inconsistent with that described in case I. His poliomyelitis also developed in a setting of minor illnesses which were similar to those known to be caused by the virus of the disease. The following facts appear significant:

1. Patient II complained of the earliest prodromal and meningeal symptoms on May 24 and paralysis on May 31.

2. An illness, simultaneous in onset with that of patient II, May 26-June 3, occurred in a school contact, BB, aged 10, who boarded the school bus just before patient II. BB was ill for one day with fever, headache and vomiting. During the following three days he felt better but not as well as usual. A second phase with fever, vomiting, pains in the legs and difficulty in walking then set in, but gradual recovery took place without residual weakness.

3. A neighborhood playmate and bus companion of patient II had a sore throat and was absent from school on May 18. A classmate of patient II, who lived a short distance away and rode a different bus, was also ill on May 18 with a "stomach upset" and moderately severe headache. The latter child was a neighbor of patient III.

4. Case II was linked directly or indirectly with four suspicious illnesses occurring prior to clinical poliomyelitis in the community. Three of the children were classmates and the fourth rode on the same school bus.

In summary, although no single specific human source could be ascertained to account for the poliomyelitis of patient II, he is known to have had contact with suggestive minor illnesses, indirect contact with the 2 earliest children with the disease, and to have been circulating in a community where minor illnesses, often corresponding to the symptoms described in abortive poliomyelitis, were prevalent.

PATIENT III.—A girl aged 14 lived on a farm about a half mile from patient II and 4 miles from patient I. Besides the father and mother there were 2 younger children aged 2 and 11 years. She attended the ninth grade of the central school, using bus 3, which carried a few children from the neighborhood of patient II. Two neighbor families with a total of 6 children had continuous contact and rode on the same school bus. Within a half mile were several other families with which contact was casual and infrequent except for the school bus and Sunday school. The following facts are significant regarding illnesses among the contacts:

1. Patient III complained of her first symptoms on May 28 and paralysis on June 2, 1944. In view of the stoical characteristics of the child, prodromal symptoms may have preceded May 28.

2. Simultaneous illnesses beginning on May 26 occurred in her 2 siblings aged 2 and 11 years. The older child complained of fever, general malaise and dizziness coming in two distinct waves. The younger child had only a one day febrile illness. The concurrent appearances of these three illnesses suggests a common source in the immediate neighborhood.

3. The 3 children of a near neighbor, who were constant playmates of patient III and her siblings, were all ill between May 14 and May 17. Two had a three day fever with sore throat, stomach upset and pains in the legs. The third had similar symptoms but without painful extremities. One of the children was a classmate of a sibling of patient I, who was ill,

Fig. 3.—Illnesses among the close contacts of case 3. The solid black represents paralytic poliomyelitis; shaded blocks represent an illness which is highly suggestive of being "abc"; dotted blocks represent an illness which has no common gastrointestinal or respiratory symptoms; triangles indicate uncertain or indefinite prodromal symptoms.

as already mentioned, with sore throat on April 3 to 5, patient I (4).

4. The second near neighbor had three children aged 10, 7 and 4, all of whom were ill between May 12 and May 28 with fever, upset stomach and headache lasting two to three days. Their contact with the family of patient III was less intimate than the previously mentioned children. The illnesses in this family, therefore, may possibly have been acquired from other friends or schoolmates.

In summary, because of the simultaneous illnesses in the siblings of patient III, 1 of whom was a preschool child, a common neighborhood source seemed likely. The 3 most intimate playmates of patient III and her siblings had minor illnesses approximately two weeks before, two of which were suggestive of abortive poliomyelitis. The illnesses are presented in figure 3. In conclusion, patient III developed paralytic poliomyelitis within five days of the onset in cases I and II. There had been no direct contact with patient I and only indirect contact with patient II. Furthermore, the short periods between onsets, one and five days respectively, would indicate either a common source for all or multiple separate sources. While the situation in both cases II and III is more complicated than in case I, the preponderance of evidence suggests multiple and not common sources for all 3.

CASES IN THE COMMUNITY SUGGESTIVE OF
POLIOMYELITIS

In the course of studying 20 reported cases of poliomyelitis and the many minor illnesses among school children, numerous persons of various ages were found whose symptoms were so suggestive or whose illnesses were so closely linked with cases of poliomyelitis that they deserved special consideration. An analysis of these cases was undertaken to study what part, if any, they may have had in the origin of the epidemic.

The nature of the illnesses which were considered as being suggestive of poliomyelitis varied greatly. Some of them were mild and lasted only twenty-four hours; others were severe with symptoms continuing for eight to ten days followed by a prolonged period of convalescence. In the mildest instances a running nose, a brief fever or a bout of vomiting might attract little attention in the family, yet from the circumstances surrounding the patient and the illness there seemed little doubt concerning the etiologic nature. In other persons high fever, persistent headache, stiffness of the neck and back and aches and pains in the legs gave the usual picture of so-called abortive poliomyelitis. All gradations of symptoms and severity were encountered.

Fig. 4.—Time relationship of 108 cases of abortive poliomyelitis to the 19 cases reported to the department of health. The one case in the shaded block was not recognized as paralytic poliomyelitis until approximately a year after the acute illness.

Before the attention of a community has been called to the possibility of abortive poliomyelitis by the development of a paralytic case, such illnesses usually escape detection. Twenty suggestive illnesses of this nature occurred in the community under discussion before the first recognized case. Nearly a year later 1 of these was found to have a decided degree of residual weakness of one leg and rightly belongs with the diagnosed cases. It is interesting to note that among the 20 persons with suggestive illnesses occurring prior to the recognition of the first paralytic case, 15 were school children, 1 was a preschool child and 4 were adults. In all, nine families were represented. Nine individuals could be linked either directly or indirectly to case I, 4 to case II and 5 to case III.

The dates of onset of the 108 illnesses considered to be highly suggestive of poliomyelitis are presented in figure 4. It will be noted that, while the paralytic cases in the community extended only over a fourteen week period, the suggestive illnesses continued throughout thirty-one weeks. The concentration of cases in the two classes occurred at the same time, but the undiag-

nosed illnesses began earlier and continued later in the season. The earliest suggestive case occurred on March 6, or eleven weeks before the first case of paralysis.

It would appear, therefore, that illnesses which were highly suggestive of poliomyelitis were occurring in the community approximately three months before the first cases of paralysis were recognized. This is in agreement with the studies reported in the preceding section, which indicated that multiple sources already existed at the time the first 3 cases of paralysis developed. The proportion of 5 highly suggestive cases for each paralytic one is probably a conservative figure.

MINOR ILLNESSES IN THE COMMUNITY

Preceding and during the period when cases of paralytic poliomyelitis were appearing in this community, there were many minor illnesses lasting one to three days and passing for colds or "grip." Some of these were predominantly respiratory in character, others gastrointestinal. Whether these illnesses differed in any way from those more or less prevalent at that time in other years could not be determined from the descriptions given by the persons affected or from the reports of the practicing physicians in the locality. Many of these were investigated by home visits, but even when the details of symptoms could be accurately recalled there was nothing concrete to serve as a basis for distinguishing those caused by common pathogens from others which, on good circumstantial evidence, must have been caused by the virus of poliomyelitis. Illnesses might occur among siblings or intimate contacts of known cases of the disease, yet the cold, running nose, sore throat, fever or vomiting described would differ in no observable way from similar symptoms in other years. Even a thorough physical examination usually failed to reveal anything characteristic of poliomyelitis. Without the aid of extensive laboratory facilities there is apparently no way of diagnosing the disease in its mildest forms. At times, however, it becomes evident in the course of history taking that the incubation period between such illnesses is different from the one to two day period of the common respiratory infections and is instead from ten to fourteen days. This in itself has served at times as a useful guide to suggest that the disease in question may have been specific in nature.

Although an attempt was made to estimate the number of such minor illnesses in the community during the epidemic, the practical difficulties were so great that no reliance could be placed on the results obtained. However, the impression was gained that such illnesses were very prevalent both before and during the epidemic. The often quoted estimates of 10 to 40 abortive cases for every one in which paralysis develops would not seem unreasonable in the light of our experiences.

COMMENT

An attempt has been made in the present study to ascertain some of the circumstances which gave rise to the epidemic of poliomyelitis in the Buffalo area in 1944. Particular attention has been directed toward the possible human sources of the outbreak, since it is now well established that during such an epidemic the most common method of spread is by person to person contact. Evidence has been accumulated which points to the conclusion that the disease was prevalent in the initial community long before the first case of paralysis was recognized. This evidence is based on studies of the illnesses among contacts, both direct and

indirect, of the first 3 cases of paralysis and on a knowledge of the minor illnesses, many of which were undoubtedly caused by the virus of poliomyelitis, which occurred in the school population during the months preceding the outbreak.

Although at the time of the epidemic the first case was believed to have developed on May 23, 1944, a year later the diagnosis of paralytic poliomyelitis was made on a patient whose acute symptoms had occurred on April 12, 1944. In addition, investigation of illnesses occurring in the community during the preceding winter and spring revealed that symptoms strongly suggestive of abortive poliomyelitis had occurred as early as March 6, 1944. This was only two months after the development of 2 cases of the disease in a neighboring community—January 3. Scattered cases had occurred during the preceding summer and fall. It seems highly probable, therefore, that the virus was continuously active but unrecognized in the area for approximately a year before an "epidemic" developed.

As a result of observations on the cases of abortive poliomyelitis and minor illnesses which preceded and followed the period in which paralytic cases developed, it appears that the concept of what constitutes an epidemic of infantile paralysis should be broadened. If the virus is a prevalent cause of symptoms many weeks before the first case of paralysis and for some time after the last, it is evident that the "epidemic" extends over a much longer period than has previously been considered. From the point of view of public health and of the development of a preventive program, some modification of our definition of the term is essential. The following divisions are suggested as offering a sound basis for efforts in the future:

1. Preparalytic phase. The duration of this phase may cover several months. Minor and suggestive illnesses begin to occur in the community but no paralysis is apparent. Evidence of a prolonged incubation period should arouse suspicion.

2. Paralytic phase. The duration of the phase of paralysis tends to be upward of three to four months. During this time nonparalytic and paralytic cases of the disease are common, and suggestive and nonspecific minor illnesses tend to reach their peak. Formerly the term "epidemic" was applied only to this period.

3. Postparalytic phase. The duration of this period tends to be shorter than that of phase 1, possibly because the proportion of susceptible individuals has now become quite small. Paralytic cases have disappeared, but mild forms of the disease still continue but in decreasing numbers.

4. Interepidemic phase. The duration of this phase is at present indeterminate. Paralytic and suggestive illnesses are absent or very rare. How the virus survives during this period can only be surmised. However, it is known to survive for at least six months in the stools of healthy carriers and for about a year in a frozen state.

An "epidemic" of poliomyelitis may well be under way long before paralytic cases are recognized.

In many respects such a concept of an epidemic has striking similarities to one caused by a virulent strain of the hemolytic streptococcus. In both the etiologic factor may be widespread before the epidemic is recognized. In the one the symptoms which attract attention are scarlatiniform rash, septic sore throat, hemorrhagic nephritis and erysipelas; in the other meningeal signs and paralysis. The number of individuals harboring the causative agent is far greater than the number recognized to have characteristic symptoms. Carriers may be circulating in the community and can be detected only by laboratory tests. Both are spread largely by

person to person contact. When these similarities are considered, an epidemic of poliomyelitis loses many of its peculiar features and conforms to an understandable pattern.

Why, however, if the virus is active in the community for several months, should paralytic symptoms appear only during the period of warm weather? While no definite answer can be given, several suggestions deserve consideration. First, it seems evident from this and former studies that the proportion of paralytic to nonparalytic cases is small. Only when the latter has reached a relatively high incidence level would the paralytic cases be expected to appear. The incidence of all forms is so clearly at a maximum during the summer months that it is only reasonable to expect paralysis to be most common at this time. Secondly, the clinical literature contains many reports suggesting that physical fatigue during the incubation and prodromal periods may encourage the development of paralysis. Certain it is that with the advent of warm weather children exercise far more vigorously than they are accustomed to in the winter. Two of the first 3 cases of paralysis in the present epidemic gave histories which lend support to this suggestion. The subject deserves further consideration. Thirdly, the summer season is the time of most widespread human contacts, particularly in rural areas. Certainly opportunities for person to person spread during this season of the year are many and varied, but why poliomyelitis should behave so differently from other diseases transmitted by similar means is by no means clear. Possibly the answer lies in a relatively greater resistance of the virus to sunshine and heat or to the summer state of the human host.

Mention should be made of the possible role which environmental and sanitary conditions may play in the origin and progress of a poliomyelitis epidemic. It is well known, particularly from the work of Paul and his associates,¹¹ that during and for some time after an epidemic the virus can be isolated from sewage, from outside toilets, occasionally from polluted and stagnant water, and in a few instances from flies which have been caught in nearby areas. Under some of these conditions the virus may remain active for several months. Theoretically, such nonhuman reservoirs would be expected to play an important role in the initiation of an epidemic and in the spread of the disease from person to person. Yet, in spite of the comparative ease with which poliomyelitis may be experimentally transferred to monkeys from these reservoirs, it has not been established that the virus in such form gives rise to the human disease. The possibility undoubtedly exists, but direct proof is still lacking. On the other hand, there is a large body of data indicating that poliomyelitis often passes from person to person by respiratory or oral transfer. The "source" usually suffers from an illness of some sort and is not a healthy carrier as ordinarily defined. This subject will be dealt with more extensively in a subsequent report.

In the community discussed in the present report a minority of the families in which paralytic poliomyelitis occurred used privies. Drainage from several of these might eventually find its way into a creek which flowed

11. Paul, J. R., and Trask, J. D.: Occurrence and Recovery of the Virus of Infantile Paralysis from Sewage. *Am. J. Pub. Health* 32: 235, 239 (March) 1942. Paul, J. R.; Trask, J. D.; Bishop, M. B.; Melnick, J. L., and Catey, A. E.: Detection of Poliomyelitis Virus in Flies. *Science* 64: 395 (Oct. 24) 1941. Ward, R.; Melnick, J. L., and Horstmann, D. L.: Poliomyelitis Virus in Fly Contaminated Food Collected at an Epidemic, *ibid.* 101: 491 (May 11) 1945.

through the township and was used for swimming below the site of the infected houses. No studies were made to determine the presence of virus in the creek, but evidence from other sources, including that presented in the first part of this report, would indicate that at best polluted streams and outside toilets could account for very few of the known cases of the disease, and almost certainly not for the first case. The evidence pointed predominantly toward a person to person transfer of the virus, most likely by means of respiratory or oral secretions. In the first reported case quite clearly the infection was acquired not "de novo" from some nonhuman source but as part of a local epidemic which had been in progress for at least three months.

The observations presented in this report offer several aids for the study of future epidemics of the disease. Perhaps most important of all is to direct attention to the interepidemic period. A greater awareness of the variety of symptoms encountered in abortive poliomyelitis might lead to earlier recognition of the disease in a community. After an epidemic has become well established it is usually too late to make the epidemiologic and laboratory investigations needed to throw light on the earliest phases of its spread. However, if teams of trained community investigators and laboratory workers could be prepared to make use of all possible developments in a particular area, there seems to be little doubt that over a period of time the torch of knowledge could be extended steadily further into the unknown. Only by such well planned and thoroughly executed labors can a sound foundation be laid for a successful preventive program.

SUMMARY AND CONCLUSIONS

A study has been made of the circumstances surrounding the development of the first 3 paralytic cases of poliomyelitis in the 1944 epidemic in the Buffalo area. The evidence indicates that these cases did not arise "de novo" but were relatively late developments in a cycle which had been in progress but unsuspected for approximately three months.

Although a period of five and one-half months elapsed between the last reported case of the preceding season and the first of the 1944 epidemic, the interval was only two months to the earliest 1944 minor illness which, based on circumstantial evidence, was caused by the virus of poliomyelitis. In view of the difficulties in recognizing such minor illnesses it seems probable that the virus was continually active in the area throughout the entire period between the two cycles.

The incidence of illnesses in the community, which were highly suggestive of being nonparalytic forms of the disease, was at least five times the number of recognized poliomyelitis cases. The week by week distribution of these suggestive illnesses followed the same general pattern as the reported cases but began earlier in the season and extended later. Other minor illnesses simulating ordinary gastrointestinal and respiratory infections were also widely prevalent.

Although no laboratory studies were made, the evidence presented suggests that the Buffalo epidemic was initiated and spread largely through direct human sources and not from polluted sewage, streams, toilets or insanitary environmental conditions.

It is suggested that the definition of an epidemic of poliomyelitis be broadened to include the preparalytic and postparalytic phases of the cycle.

EFFECT OF EXERCISE ON BLOOD PRESSURE OF PATIENTS WITH ADVANCED HYPERTENSION

BEFORE AND AFTER THORACOLUMBAR SYMPATHECTOMY

JERE W. LORD JR., M.D.

AND

J. WILLIAM HINTON, M.D.

NEW YORK.

The most important measure of the value of an operation designed for the treatment of hypertension is the degree of fall in the blood pressure postoperatively. When results are discussed, the change in the levels of the blood pressure far outrank in importance the other measures of improvement, such as symptomatic relief, regression in cardiac size, improvement in the electrocardiogram and the eyegrounds. Smithwick¹ has emphasized the need for determining the blood pressure in the lying, sitting and standing positions preoperatively and postoperatively because of the significant effect of posture on its level.

TABLE 1.—Average Blood Pressure Levels of Thirty Patients

	Resting	Standing	After Exercise
Preoperative.....	200/122	202/132	223/138
Postoperative.....	160/107	141/103	158/106

TABLE 2.—Analysis of Change in Blood Pressure Levels of Thirty Patients Following Exercise

	Fall	Same	Rise
Preoperative			
Systolic.....	3	1	26
Diastolic.....	3	1	26
Postoperative			
Systolic.....	15	5	10
Diastolic.....	12	8	10

As a result of some interesting experimental data obtained by Blakemore and King,² we have studied the effect of moderate exercise on the blood pressure of a group of patients suffering from advanced hypertension before and after thoracolumbar sympathectomy. Blakemore and King observed that the blood pressure of normal dogs exercised on a treadmill did not change significantly. However, if the animals were sympathectomized, similar exercise resulted in a definite fall in the blood pressure, the fall being roughly proportional to the magnitude of the sympathectomy.

Another point of importance is the fact that patients with hypertension in all but the terminal stage are individuals who are exercising to a greater or lesser extent in their daily activities and experiencing emotional situations, both factors being quite different from the more or less basal conditions of blood pressure determinations as emphasized by Smithwick in the study of patients before and after sympathectomy.

We have determined the blood pressure in 30 consecutive ambulatory patients before and after sympathectomy in the following way:

The patient lies quietly for five minutes, when the blood pressure is taken; the patient assumes the sitting

1. Smithwick, R. H.: Surgical Treatment of Hypertension, Arch. Surg. 49: 180-193 (Sept.) 1944; The Surgical Treatment of Hypertension, New York State J. Med. 44: 2693-2700, 1945.
2. Blakemore, A. H., and King, B.: Personal communication to the authors.

position and the blood pressure is taken after one minute has elapsed; the standing position is next taken and after one minute the blood pressure determined and then the patient exercises by stepping up and down onto a low footstool first with one leg then with the other for twenty times in all and with each step raises the arms from the side anteriorly to the horizontal level. Postoperatively the same routine is repeated when the patient is sufficiently strong to carry out the exercise test.

The results are interesting and lend added weight to the value of thoracolumbar sympathectomy in the treatment of hypertension. Table 1 shows the average systolic and diastolic blood pressure levels of the 30 patients determined first in the lying position, then in the standing position and finally after the exercise test. Also shown are the averages for the same patients following the two stage thoracolumbar sympathectomy. It is noteworthy that preoperatively exercise elevates the systolic by 23 mm. of mercury and the diastolic by 16 as compared with the resting levels. On the other hand, postoperatively exercise causes no significant change in the level of the blood pressure. Further, a comparison of the preoperative and postoperative resting diastolic levels reveals a fall of 15 mm., which places the entire group into group III of Smithwick. However, a comparison of the preoperative and postoperative diastolic levels after exercise shows an average fall of 32 mm.; in other words, Smithwick's group I. Chart 1 illustrates in another way these data.

An analysis of the data obtained from the study of the effect of exercise on levels of the 30 patients before and after sympathectomy reveals that 26 patients pre-

figure being 107 to 106 mm. (table 1). Of the systolic levels 15 fell, there was no change in 5, a rise occurred in 10 and there was an average of 160 to 158 (table 1). These data are shown in table 2.

The levels of blood pressure obtained from 1 of the patients illustrating the effect of exercise before and

Chart 1.—Preoperative and postoperative diastolic levels.

operatively showed a rise in the diastolic level, in 1 there was no change, and in 3 exercise caused a slight fall. The postexercise level was compared with the resting level in each instance. Precisely the same proportion held for the systolic levels. However, postoperatively the exercise study showed a fall in the diastolic in 12 patients, no change in 8 and a rise in 10, the average

Chart 2.—Effect of exercise before and after thoracolumbar sympathectomy.

after thoracolumbar sympathectomy are presented in chart 2. The patient was a white man aged 42 with malignant hypertension, having an elevated nonprotein nitrogen level of 50 mg. per hundred cubic centimeters, the eyegrounds showing hemorrhages, exudate and papilledema and there being a urea clearance of 27 per cent. The resting blood pressure of 280/180 rose to 300/195 following exercise. One month postoperatively his resting level was 145/125, which after exercise fell to 110/100. Symptomatically the patient feels much improved. Three months postoperatively the patient's resting blood pressure was 130/80 and a urinalysis showed no albumin or red blood cells, in contrast to the preoperative examination, which revealed innumerable red blood cells and over 100 mg. of albumin per hundred cubic centimeters.²

SUMMARY

To our knowledge the favorable influence of exercise on the blood pressure of patients with advanced hypertension following thoracolumbar sympathectomy has not hitherto been mentioned. In the series of 30 patients discussed in this paper the average postoperative fall in the resting diastolic blood pressure was 15 mm. However, when the preoperative and postoperative

diastolic levels following exercise were compared, an average fall of 32 mm. was observed.

The evidence further emphasizes the value of thoracolumbar sympathectomy as a therapeutic measure in the management of patients suffering from advanced hypertension.

INSOMNIA DUE TO LEFT VENTRICULAR HEART FAILURE

UNRECOGNIZED AS SUCH AND INADEQUATELY TREATED

EDWIN O. WHEELER, M.D.

AND

PAUL D. WHITE, M.D.

BOSTON

The signs and symptoms of left ventricular failure have been described frequently, and their clinical significance is well known. Certain symptoms, namely exertional dyspnea, paroxysmal nocturnal dyspnea, orthopnea and sometimes cough, and certain signs, namely gallop rhythm, pulsus alternans and increase of the pulmonary second sound, are generally recognized as early evidence of failure of the left side of the heart. Patients with dyspnea and orthopnea do not, as a rule, sleep well, but little space in the literature has been devoted to the insomnia resulting from these symptoms other than to mention that it occurs, for in most patients the insomnia is of secondary importance. Relief of pulmonary congestion by either digitalis or diuretics often causes a striking improvement in the patient's condition, and as the orthopnea disappears so does the accompanying insomnia.

There are patients, however, with left ventricular failure and pulmonary vascular congestion in whom the principal complaint is insomnia with little or no recognition of shortness of breath. In reviewing the literature we were unable to find any discussion of such cases. The following cases are therefore of interest:

CASE 1.—A business man aged 69 was first seen medically by us for a check-up in November 1941. Hypertension had been found a year before, but the patient had noticed no symptoms. On physical examination his heart was found to be slightly enlarged, and there were slight apical and aortic systolic murmurs. The pulse was regular at a rate of 80, and the blood pressure was 220 mm. systolic and 140 mm. diastolic. There was no evidence of congestive failure. Fluoroscopy of the chest showed moderate cardiac enlargement without pulmonary congestion. An electrocardiogram was normal.

He remained in good health until December 1942, when he began to suffer from substernal pressure on effort. This symptom progressed in frequency until May 1943, when he had several nocturnal attacks culminating in an episode of substernal oppression with radiation to the arms and jaw, which lasted many hours. He was admitted to the hospital, where an electrocardiogram confirmed the diagnosis of acute myocardial infarction. Physical examination was unchanged except for the presence of a very slight aortic diastolic murmur. He made an uneventful recovery and was sent home without any medication.

During the next year he continued to do well, working as usual, but his blood pressure remained high and his heart size increased a little. In June 1944 he developed a thrombosis involving the optic tracts and had a partial hemianopsia, from which he largely recovered in a few weeks time. In September, because of the finding of a larger heart and a slight diastolic

gallop rhythm, he was digitalized. There was no evidence of pulmonary congestion, but left ventricular failure was thought to be impending.

His health remained about the same until late in December 1944, when he began to complain of insomnia. During the next few weeks his insomnia became more severe and did not respond to various hypnotics. He also began to complain of having to sit up nights and of increased dyspnea on exertion. Examination revealed a return of the gallop rhythm, accentuation of the pulmonary second sound and a slight increase of the jugular pulse. The lungs were clear. On a regimen of ammonium chloride, increased digitalis and limited fluids and salt he immediately improved and was able to sleep well again. He then continued to be active and slept well until Jan. 26, 1945, when he had a brief episode of acute pulmonary edema, which responded to rest and diuretics.

CASE 2.—A business man aged 54 was first seen by us in February 1943 with complaints of nervousness, palpitation and fatigue and a history of hypertension for the previous twenty-five years. For several years he had been taking digitalis because of an irregular pulse, but there had been no episodes of congestive failure. Physical examination revealed a blood pressure of 172 mm. systolic and 102 mm. diastolic at a pulse rate of 72. The heart was enlarged, but the sounds were of good quality and there were no murmurs. No evidence of congestive failure was found. Fluoroscopy of the chest revealed slight fullness of the left ventricle but no pulmonary congestion. An electrocardiogram showed auricular fibrillation at a rate of 70, with sagging of the ST segments, presumably due to digitalis effect. A diagnosis was made of hypertensive heart disease and auricular fibrillation.

The patient improved and remained well until May 1943, when he noted the gradual onset of shortness of breath on exertion, culminating in several brief attacks of paroxysmal nocturnal dyspnea. Examination at that time revealed slight orthopnea, increased venous pulse in the neck, increased heart size, a diastolic gallop rhythm, a slight (grade 2) apical systolic murmur and signs of congestion with fine rales at the lung bases, liver enlargement and slight sacral edema. Left ventricular failure secondary to hypertension was considered to be the predominant cause of his symptoms, and treatment with diuretics was recommended. He improved rapidly and did well for a short time thereafter.

He was seen at frequent intervals during the summer and fall of 1943, complaining of progressive insomnia and nocturia without other urinary difficulties. Examination at these visits showed no evidence of peripheral or pulmonary congestion, and the heart sounds had improved, with a disappearance of the gallop rhythm.

During the late fall his insomnia grew much worse, and though he stated that he did not have shortness of breath he insisted on sitting in a chair most of the night. A number of sedatives and hypnotics were tried without giving him relief, generally producing disorientation. He gradually became so restless, nervous and apprehensive that commitment to a mental hospital was considered and he was therefore seen by a psychiatrist. The latter thought the patient might have a toxic psychosis. In December 1943 he was hospitalized for study. On examination he presented evidence of congestive failure with a return of the jugular pulse, gallop rhythm, an apical systolic murmur and liver enlargement. The lungs were clear on physical examination, but an x-ray film of the chest showed the lung markings to be prominent. All sedation was stopped, and he was given ammonium chloride and mercupurin, in addition to the digitalis and the fluid and salt restriction already in use. He had a good diuresis with an increase in his vital capacity from 2.8 to 4.0 liters, a disappearance of his congestive failure and complete relief of his insomnia. His mental state improved immediately, and within a few days he felt normal. After a few weeks of rest in the hospital he went home greatly improved.

For six months he continued to feel well without insomnia or evidence of congestion. He did not require mercurial diuretics. In August 1944 he again complained of insomnia without

shortness of breath, and examination showed a return of the congestive failure. Again the insomnia disappeared when his daily ration of digitalis was increased and mercurial diuretics were given. He has remained fairly well to the present time without symptoms of sleeplessness and with his congestive failure under control.

CASE 3.—A man aged 65, a lawyer, was first seen by us in October 1941, eight months after a typical myocardial infarction. He had no cardiac complaints at that time. Examination showed slight cardiac enlargement and a slight aortic systolic murmur. The blood pressure was 160 mm. systolic and 100 mm. diastolic at a pulse rate of 72. There was no evidence of congestive failure. Fluoroscopy of the chest confirmed the presence of slight cardiac enlargement without evidence of pulmonary congestion. An electrocardiogram showed evidence of an old anterior myocardial infarction. A diagnosis was made of coronary heart disease and a healed myocardial infarct.

He then remained quite well until February 1944, when he entered the hospital because of restlessness and sleeplessness at night, slight swelling of his ankles and a low grade fever. He had noted some increased exertional dyspnea but stated that he did not have shortness of breath at night. He was, however, more comfortable sitting in a chair or walking about the room. Examination showed increased heart size, pulmonary congestion, hepatic congestion and slight pitting edema of the legs, more pronounced on the right. An x-ray film of the chest confirmed the increased heart size and showed the lung markings to be prominent, suggesting vascular congestion. This episode of congestive failure was probably precipitated by a pulmonary embolus originating from a thrombophlebitis of the right leg, though pulmonary infection could not be ruled out. Treatment was begun with digitalis, ammonium chloride and mercupurin. He had a good diuresis and soon lost the evidence of congestive failure. With this the nocturnal restlessness disappeared, though he did not notice much difference in his breathing.

After discharge from the hospital he remained relatively inactive at home, continuing to have exertional dyspnea but no evidence of congestive failure. Four months later, in June 1944, he was again seen because of insomnia and restlessness at night, symptoms which had disturbed the rest of the family. He preferred to sit up at night but stated that he did not have shortness of breath, as on the previous occasion. Examination showed evidence of congestive failure. Another course of diuretics relieved the congestion and he again slept much better.

In August 1944 congestive failure was again precipitated, this time by ventricular tachycardia without evidence of a recent myocardial infarction. Since that episode he has done poorly, with constant peripheral and occasional pulmonary congestion.

CASE 4.—A man aged 70, a real estate broker, first seen by us in October 1942, was complaining of painful spasms in the epigastrium coming on after eating, but he had no cardiac complaints. Five years before he had been told of the presence of heart disease and had been advised to limit his activities. Examination revealed moderate cardiac enlargement, a loud (grade 4 to 5) harsh aortic and apical systolic murmur, and along the left sternal border a slight early diastolic murmur. There was a systolic thrill over the aortic area. The blood pressure was 170 mm. systolic and 95 mm. diastolic, and the pulse was regular at a rate of 60. There was no evidence of congestive failure. Fluoroscopy of the chest showed a big heart without evidence of pulmonary congestion. His electrocardiogram was abnormal but of no characteristic pattern. A diagnosis was made of aortic stenosis and insufficiency on a calcareous and possibly rheumatic basis.

The patient continued to have no cardiac symptoms until January 1943, when, following a good deal of hard physical work, he began to be bothered almost nightly by a sensation of fullness in the epigastrium and very slight dyspnea, lasting one half to three quarters of an hour. This was relieved when he sat up. Examination showed no changes, and the lungs were clear. Since it was suspected that congestive heart failure was the cause of the nocturnal distress, the patient was digitalized

and instructed to rest. The symptoms soon disappeared and again he slept well.

In April 1943, following a day of hard physical work, the symptoms recurred, especially the epigastric distress, which awakened him at frequent intervals. This was accompanied by only a little dyspnea, which did not bother the patient. He did notice, however, more than his ordinary dyspnea on exertion. Physical examination revealed no significant change, and the lungs were clear. On a program of increased rest his symptoms again improved, and he was able to sleep without discomfort.

During the past year and a half he has continued to have insomnia, epigastric distress and slight dyspnea from time to time, usually precipitated by overexertion and relieved by rest and diuretics, and recently by a very low salt diet.

COMMENT

Insomnia as a presenting symptom of pulmonary vascular congestion has been generally neglected, because obvious dyspnea, orthopnea or Cheyne-Stokes respiration is usually also present and dominates the clinical picture. Insomnia may, however, be an early and predominant symptom of pulmonary congestion due to left ventricular failure, in cases in which dyspnea is not a prominent complaint. In these cases the insomnia is likely to be misjudged as a symptom of heart failure and ascribed to some other cause. Especially is this true in the absence of basal rales. The insistence of the patient on sitting up, which is evidence of ill defined orthopnea, in the presence of physical signs of left ventricular weakness (gallop rhythm, pulsus alternans and accentuation of the pulmonary second sound) may lead to a recognition of the etiology of the sleeplessness.

Thus it behooves the physician dealing with patients who show features of strain on the left ventricle, namely hypertension in particular, aortic valve disease (stenosis or regurgitation) and extensive myocardial infarction, acute or chronic, to be constantly on guard to watch for early dyspnea, either on effort or as a cause of insomnia, so that adequate treatment may be speedily prescribed to combat the left ventricular weakness and failure which are responsible. The significance of obvious dyspnea is common knowledge and receives as a rule adequate treatment, but the insomnia is likely to be misinterpreted and vainly or inadequately controlled by hypnotics, often causing a serious delay of days or weeks before the signs of increasing heart failure become so evident that radical or emergency treatment proves necessary. At such later stages of heart failure insufficiency of the right ventricle (as shown by increased systemic venous pressure, liver enlargement and dependent edema) tends to appear, and if such right ventricular failure becomes pronounced the pulmonary congestion, and with it the insomnia, may lessen, but painful liver enlargement may take its place and in its turn also cause some insomnia. Rest and digitalis alone may suffice to control the orthopnea and insomnia of early left ventricular failure, but sometimes it is necessary to resort to diuretics, especially the mercurials, in repeated dosage and to a very low salt diet (which will be the subject of a later communication).

SUMMARY

Insomnia is a frequent symptom of left ventricular heart failure and in some cases is unrecognized as such and therefore inadequately treated because of the tendency to overlook the underlying pulmonary congestion and resulting orthopnea.

THE TREATMENT OF SPOTTED FEVER
WITH PARA-AMINOBENZOIC ACID

HARRY M. ROSE, M.D.
RICHARD B. DUANE, M.D.
AND
EDWARD E. FISCHER, M.D.
NEW YORK

For a long time attempts have been made to find a chemotherapeutic agent of value in rickettsial diseases, and recently such a substance apparently has been found in para-aminobenzoic acid. Snyder, Maier and Anderson¹ were the first to show that the oral administration of this compound would effectively reduce the mortality from experimental murine typhus in white mice, while Hamilton, Plotz and Smadel² found that para-aminobenzoic acid would inhibit the growth of both epidemic and murine typhus rickettsias in the developing hen's egg, thereby prolonging the

Course of illness.

survival time of infected chick embryos. These observations were independently confirmed by Greiff, Pinkerton and Moragues,³ who studied the effects of para-aminobenzoic acid on infections with murine typhus rickettsias in both eggs and mice. The work of all these investigators indicated that para-aminobenzoic acid did not exercise a direct lethal action on the rickettsias but interfered in some way with their proliferation within tissue cells, probably by the modification of as yet unidentified enzyme systems. Moreover, para-aminobenzoic acid alone would produce these effects; substituted compounds and the ortho and meta forms of the drug were entirely inactive.

From the Departments of Medicine and Bacteriology, Columbia University College of Physicians and Surgeons, and the Presbyterian Hospital.

2. Hamilton, H. L.; Plotz, H., and Smadel, J. E.: Report to the Director of the United States of America Typhus Commission, Dec. 16, 1943, published as Effect of p-Aminobenzoic Acid on the Growth of Typhus Rickettsiae in the Yolk Sac of the Infected Chick Embryo, Proc. Soc. Exper. Biol. & Med. 58: 255-262 (April) 1945.
3. Greiff, Donald; Pinkerton, Henry, and Moragues, Vincent: Effect of Enzyme Inhibitors and Activators on Typhus Rickettsiae: I. Penicillin, Para-Aminobenzoic Acid, and Vitamins of the B Group, J. Exper. Med. 44.

Clinical application of this knowledge was made by Yeomans, Snyder, Murray, Zarafonetis and Ecker⁴ of the United States of America Typhus Commission, who studied the therapeutic effect of para-aminobenzoic acid on human louse borne typhus in Cairo, Egypt. Their results in 20 treated cases, compared with those in 44 untreated controls, indicated that the course of the disease could be favorably modified, provided the drug was given within the first week of the illness. Large doses of the compound, from 24 to 28 Gm. every twenty-four hours, were given orally in order to obtain adequate blood concentrations, which were considered to be between 10 and 20 mg. per hundred cubic centimeters; but no toxic reactions were encountered other than temporary reduction in the leukocyte counts in some cases.

That para-aminobenzoic acid may also be of value in the treatment of rickettsial infections other than typhus fever is suggested by the experiments of Anigstein and Bader,⁵ who found the drug to be very effective therapeutically in guinea pigs infected with Rocky Mountain spotted fever rickettsias. Control guinea pigs inoculated intraperitoneally with the spotted fever rickettsias invariably succumbed, while of those fed para-aminobenzoic acid as 2 per cent of the diet nearly all recovered with few or no signs of illness. Furthermore, Hamilton⁶ has recently reported that para-aminobenzoic acid inhibits the growth of spotted fever rickettsias in chick embryos to an even greater extent than typhus rickettsias.

Since no clinical reports on the use of para-aminobenzoic acid in the treatment of spotted fever in the human subject have yet appeared, we present the following case, in which administration of the drug soon after the onset of symptoms of the disease was followed by rapid and uneventful recovery.

REPORT OF CASE

History.—R. B., a white American woman aged 46, a housewife, was admitted to the Presbyterian Hospital on Aug. 5, 1945 with complaints of malaise and fever of three days' duration, headache of two days' duration and a rash which appeared on the day of admission.

The past history was irrelevant to the present illness. Nine days before admission, after a day spent in central Long Island, N. Y., the patient discovered a tick firmly attached to the left buttock. The insect was removed with difficulty, and a small pustular lesion developed at the site of attachment. Three days before admission she noted the onset of generalized malaise, with muscular aches and pains, and she had a shaking chill. The following day anorexia developed, with mild nausea, feverish sensations and a constant, throbbing retro-orbital headache that became progressively more severe. She also became drowsy and a little disoriented. On the day of admission a spotted skin eruption first appeared on the lower part of the left leg.

On entry to the hospital the temperature was 104.4 F., the pulse rate 120, the respiratory rate 24 and the arterial pressure 120/70. The patient, who was well developed and nourished, did not appear to be in acute distress. Scattered over the body, but especially on the extremities and the palms of the hands, was a pinkish macular rash which blanched easily on pressure. The individual cutaneous lesions were discrete and averaged about 3 mm. in diameter. There was no enanthem. A small pustule, surrounded by a zone of erythema, was found

5. Anigstein, Ludwik, and Bader, M. N.: Para-Aminobenzoic Acid—Its Effectiveness in Spotted Fever in Guinea Pigs, Science 101: 591-592 (June 8) 1945.
6. Hamilton, H. L.: Effect of p-Aminobenzoic Acid on Growth of Typhus Rickettsiae in the Yolk Sac of the Infected Chick Embryo, J. A. M. A. 126: 220-226 (June) 1945.

on the left buttock at the site of the tick bite. The remainder of the examination was essentially negative. The heart and lungs were not remarkable. The abdomen was soft and the spleen could not be palpated. There was no lymphadenopathy. The reflexes were intact.

The admission diagnosis was Rocky Mountain spotted fever. Laboratory examinations revealed hemoglobin 13.5 Gm., erythrocytes 5,030,000, leukocytes 9,050, with polymorphonuclears 85 per cent, lymphocytes 11 per cent and monocytes 4 per cent. The urinalysis was negative except for a heavy trace of albumin. The Kline test was negative. Two blood cultures remained sterile. Cultures of the nose and throat failed to reveal either hemolytic streptococci or meningococci. Stool cultures yielded no enteric pathogens. The Widal test, with *Salmonella* group A, B, C and D antigens, was negative.

Weil-Felix agglutinative tests with *Proteus* OX19 on August 5 and 6, the fourth and fifth days of the illness, were both positive in a titer of only 1:20. On August 13, however, the titer had risen to 1:2,560, and on August 15 the titer was 1:1,280.

Scrums were submitted to Dr. I. A. Bengtson⁷ at the National Institute of Health, Bethesda, Md., for complement fixation tests with specific rickettsial antigens. Dr. Bengtson reported that serum drawn on August 6 gave negative complement fixation reactions with both murine typhus and spotted fever antigens, while serum taken on August 15 gave positive reactions in dilutions of 1:8 with the typhus antigen and 1:64 with the spotted fever antigen.⁸

Guinea pigs inoculated intraperitoneally with whole blood taken on the fifth day of illness developed characteristic febrile reactions, transmissible in series, and rickettsias were demonstrated in the yolk sacs of developing hen's eggs inoculated with whole blood and plasma taken the same day.

Course.—Throughout the first two days of the patient's stay in the hospital a high sustained fever ranged to 105.8 F., as illustrated in the chart, and she was drowsy and irritable. During this period the rash became more pronounced and hemorrhagic in character, and on the second day there was a small epistaxis.

Thirty-six hours after admission therapy was started with para-aminobenzoic acid, 4 Gm. initially and then 2 Gm. in 25 cc. of chilled 5 per cent sodium bicarbonate every two hours. The drug caused some nausea, necessitating omission of occasional doses, and therefore the individual dose was raised to 2.5 Gm. the following day, during which 25 Gm. was given. Treatment was continued for four days subsequently, the total daily intake being 30, 26, 20 and 8 Gm. respectively.

Blood levels of the drug were calculated by a method used for the determination of sulfonamides and were 6.6, 16.4 and 18.6 mg. per hundred cubic centimeters on the second, fourth and fifth days of treatment.

Following the first twenty-four hours of therapy with para-aminobenzoic acid clinical improvement was evident and continuous, with a rapid decline of fever and alleviation of headache, drowsiness and irritability. The rash quickly subsided and was almost inapparent by the end of the first week. No fresh physical signs appeared except for a palpable spleen tip noted from the fifth to the eighth day.

On the whole, the drug was well tolerated and produced no toxic effects other than perhaps a moderate depression of the leukocytes noted during convalescence.

Ten days after entering the hospital the patient was entirely asymptomatic, and her subsequent course was uneventful. She was discharged three weeks after admission.

COMMENT

The history of tick bite, the clinical manifestations of the disease, the results of the serologic tests and the recovery of the etiologic agent leave no question that the patient suffered from Rocky Mountain spotted fever. This disease is sometimes fatal, often severe, and usually pursues a febrile course for at least ten

days.⁹ The administration of para-aminobenzoic acid in amounts sufficient to give blood levels as high as 18.6 mg. per hundred cubic centimeters of a diazotizable substance¹⁰ was closely followed by a precipitous drop in temperature and a rapid defervescence of signs and symptoms. Although we cannot conclude from a single case that these effects were directly attributable to the drug, their relationship suggests that such was the case. Further reports on the use of para-aminobenzoic acid in the treatment of spotted fever will doubtless be forthcoming from other sources where opportunities to observe the disease occur more frequently than in the city of New York.

SUMMARY

A case of Rocky Mountain spotted fever was treated with para-aminobenzoic acid. The results suggest that the drug exercised a beneficial effect on the course of the disease.

Special Article

OPPORTUNITIES FOR THE MEDICALLY TRAINED IN PUBLIC HEALTH

THOMAS PARRAN, M.D.

SURGEON GENERAL, U. S. PUBLIC HEALTH SERVICE

NOTE.—This article was prepared especially for THE JOURNAL. It indicates opportunities and responsibilities in the field of public health.—ED.

The nation needs physicians to man its state and local health departments. At this time of demobilization, young medical officers especially are urged to give consideration to useful careers in public health.

A recent survey conducted by the Public Health Service reveals that there are 3,000 full time medical positions in state and local health departments. Nearly 900 of these positions are now vacant. Half of these vacant positions are being held for individuals on leave in the military services. The other half are vacancies without restrictions waiting to be filled by qualified physicians.

These positions call for people with special training in public health. Already the several schools of public health are sensing the increased demand for training which leads to the degree of master or doctor of public health.

The various types of full time medical positions in public health departments include health officers, assistant health officers, epidemiologists, directors of bureaus in the field of tuberculosis and venereal disease control, laboratories, maternal and child health, industrial hygiene and in state supervision of local health administration.

The physician practicing the specialty of public health has for his patient the entire community, whose characteristics are as varied and complicated as the physiologic, anatomic and personality traits of the individual—a patient subject to the same pathologic processes as the individuals who make it up.

The health officer occupies an administrative position directing the work of full and part time physicians

10. The proportion of the drug converted to para-aminhippuric acid is unknown.

and dentists, public health nurses, public health engineers, health educators, veterinarians, statistical analysts, laboratory people and others. The health officer's task is one of protecting the health of the community as a whole.

With the aid of his staff, the health officer must plan the local health program and decide what needs to be done for community health protection. To do so, he must acquaint himself with the local health problems. He must understand the process of evaluation of health activities and health facilities. He must know the death rates and morbidity rates from different causes. He must become acquainted with rates in other communities that he may interpret the problems in his own community soundly. He must know administration, how to give leadership to his staff and how to get along with people, professional and lay.

His field of operations is only partly medical. It also encompasses engineering and sanitary problems, social problems and research—administrative, laboratory and field.

The health officer must concern himself with securing complete pasteurization of the milk supply. He will have to ferret out the causes of the mysterious occurrence of typhoid or undulant fever. He should be ingenious enough to induce people with tuberculosis to go to and stay in a sanatorium. He may even have to develop community support to provide tuberculosis hospitals. His interest must encompass the cleanliness of dishes in restaurants, the wholesomeness of food supplies, the protection of swimming pools.

He should do something more than wait till a full fledged case of tuberculosis or syphilis is reported. He must find and examine contacts and get them under treatment either with private physicians or in public clinics. He is interested in therapy, but even more he is interested in prevention. He sees to it that young children are adequately protected against diphtheria, whooping cough and smallpox. He encourages starting dental care early in life and continuing it throughout life. This interest is not just academic or passive. His job is to see that people get needed service.

In some areas he will be a hospital administrator as well as direct a health department staff. In anticipation of trends in medical care, he needs to know about administration of the different forms of prepaid hospital and medical care.

He is concerned with the salaries of his staff, with equitable rules for sick leave and vacations, retirements and pensions and in-service training of his staff. He must be considerate, sympathetic, fair and at times stern. He must keep informed and up to date on scientific advances in medicine and public health.

In preventing illness he will have to teach the public, and, to do so himself and have his staff do so, he must be aware of the educational principles of learning. He must be willing to learn from educators and seek and utilize educational advice.

There are satisfactions in being a health officer—different satisfactions from those that come to a general practitioner but still heart warming and real. The health officer doesn't have to get up at 2 a. m. and drive several miles to attend a woman in labor, but he will have to attend some evening meetings and discuss with groups maternal care and child care and numerous other topics.

In wrestling with major health problems and in developing programs to reduce the health hazards of his

community, the local health officer is afforded unusual opportunity for leadership in preventive medicine among the medical profession and the general population. Because of the tangible contributions which he makes to the health and welfare of the area, the enterprising health officer can easily win the esteem and cooperation of all groups regardless of their economic or social status, their religious or political affiliation.

In the military services, approximately 60,000 physicians have been experiencing the financial security of a fixed salary. A similar security is offered in most public health positions. Salaries will range generally from \$4,000 to \$6,000 a year, with no additional personal expense of maintaining an office and equipment and employing a nurse or assistant. In the more important positions, salaries will run above \$6,000 and up to \$10,000 a year. The extension of state merit systems, with their salary classification, promotion and, particularly, retirement or pension plans, and their provisions of liberal annual and sick leave, enhance the feeling of security. Furthermore, with the growth and expansion of public health departments there is increasing recognition of the necessity of salary advancement to attract and hold able people. While public health specialists may not command a salary comparable to the income of the most prosperous practitioners, in general over the years their salaries will compare not unfavorably with the net income of practicing physicians in most communities.

It must not be overlooked also that public health experience is a valuable asset to the physician who seeks other fields of service. Private associations, business and industry frequently are on the lookout for persons with these qualifications at even more attractive salaries than those mentioned.

In other positions than that of health officer, medical men with public health training will plan and direct special services for the larger health departments—tuberculosis, venereal diseases, child hygiene and the like. This will provide a closer contact with the clinical field and with hospital service. But it will also call for administrative duties and teaching experience.

How does a young medical man or woman enter the field of public health? Let us follow the main highway, the most desirable route to pursue, recognizing that there are bypaths and shortcuts which are necessary for some who are unable to take the full journey, or are permissible for others who have already made part of the trip in previous public health experience.

The approved route through training to a full-fledged job starts with an orientation course in a state or local health department. Here for six months to a year the young candidate works and is paid by the health department as a health officer or epidemiologist in training, or as a junior health officer. Different titles are used in different states. The position is a subordinate one without administrative responsibility but with a chance to see and feel what goes on in a health department. Assignment may be in a tuberculosis clinic or as an assistant to an epidemiologist in the field. The assignment may be changed several times during the training period.

This orientation course or "trial flight" is designed for two purposes, to permit the candidate to decide whether he really likes this field of work and wants to continue, and to permit the employer to decide whether the candidate has the stuff in him to make a good health officer and whether he is worth a further investment in training.

At the successful conclusion of this period, the candidate would enter an accredited school of public health in the fall term for his academic training. At the end of eight or nine months, again if successful, he would receive a degree of Master of Public Health. He would then be assigned to a field training center for a period of three months to a year. This would be a selected local health department, equipped to provide individual attention to the student. Here, as an assistant health officer and under guidance, he would receive practical field experience. He would carry responsibility.

At the end of this period he would be appointed to a regular position as health officer in a smaller community or assistant health officer in a larger community. He is now launched on a public health career.

Young medical graduates who desire to enter the public health field, on leaving the military services, have several paths open to them. Application for training may be made directly to a school of public health. Ordinarily the course begins in the autumn term, and arrangements should be completed from three to six months ahead of time. The schools are experiencing increased registrations, and their facilities are limited. However, to meet the present emergency they have expressed a willingness to adjust their program accordingly and will admit a few students during the term or at the beginning of the second term around February 1.

Another procedure is to write to the state department of health in the capital city of the state of residence. Owing to the pressing need for medical men, an appointment may be secured for the time being, with training in a school of public health to follow later.

Physicians previously employed in state or local health departments should of course get in touch with their former employer and request training at the first convenient opportunity.

The schools within the group known as the Association of Schools of Public Health are eight in number and are located at Columbia University, New York; Harvard University, Boston; Johns Hopkins University, Baltimore; University of Michigan, Ann Arbor; University of Minnesota, Minneapolis; University of North Carolina, Chapel Hill; Vanderbilt University, Nashville, Tenn., and Yale University, New Haven, Conn.

Physicians leaving the military service who can qualify are entitled to financial aid in training under the G. I. Bill of Rights. This provides from \$50 to \$75 a month subsistence allowance and up to a maximum of \$500 a year for tuition and university fees. Application for these aids should be taken up with the educational counselor at the camp or separation center or may be made directly to the manager, Veterans Administration, at the nearest state office.

For those unable to meet the cost of professional training on these allowances, state funds are available under the federal grants-in-aid. These funds are granted to employees of state and local health departments, and application should be made to the local health officer or directly to the state department of health.

In some instances where state funds for training are not available, applicants may write to the Professional Training Unit, Division of Public Health Methods, U. S. Public Health Service, Bethesda 14, Md. Every effort will be made to place applicants in touch with some of the foundations having fellowships available.

While the foregoing description has focused on the induction of medical people into public health training,

it should be remembered that training with financial aids as described is likewise open for dentists, public health engineers, public health nurses, statistical analysts, laboratory workers, health educators, veterinarians and others whose qualifications are adequate and who wish graduate training in preparation for a career in public health.

The war has dramatically demonstrated what consistent application of the principles of public health by trained personnel can do in maintaining the health of the population. In the postwar period the same high quality of public health service must be maintained and extended so that we may realize the high level of health we in America seek for all our people. That objective is a challenge to all those whose ideals are a career of service for the welfare of their fellow men.

Clinical Notes, Suggestions and New Instruments

ACTINOMYCOTIC GRANULOMA OF THE STOMACH

COMMANDER CLARENCE C. FULLER (MC), U.S.N.R.

AND

LIEUTENANT COMMANDER HAROLD WOOD (MC), U.S.N.R.

The stomach is a rare site for *Actinomyces* to gain a primary foothold. While the fungus is known to be of relatively low pathogenicity, once a port of entry is established the infection is very tenacious, and a granulomatous lesion results. Intestinal actinomycosis is well known. Two factors could be conducive to its relatively frequent occurrence in the appendix and the large intestine: stasis, and the common presence of mucosal imperfections. The stomach offers only one of these conditions commonly—mucosal defects. Hypothetically, the most favorable circumstances for the development of gastric actinomycosis might be the simultaneous presence of mucosal defects and viable *Actinomyces* in the stomach content or the production of mucosal defects by the ingestion of infected roughage.

The literature contains few case reports of primary gastric actinomycosis. Blain¹ presented briefly a review of the United States and European literature in 1933 and reported a case of primary actinomycosis of the stomach. He concluded that his was the first case of this type to be presented in the medical literature of this country. Quoting the review of the European literature by Nathan,² Blain stated that only 1 of the 6 cases reported there survived strict diagnostic scrutiny.

In the case reported by Blain¹ the symptoms, the roentgenologic studies and the gross and microscopic appearance of the gastric granuloma were strikingly similar to the case reported here; however, Blain's patient had metastatic lesions of the liver and died six months after gastrectomy.

REPORT OF CASE

History.—A man aged 48, a loom fixer, had been examined in a nearby hospital the week before admission. He had presented the symptoms of heartburn and occasional eructation and vomiting after eating. Those symptoms had been active over a period of five years, and their frequency had recently increased. A weight loss of 20 pounds (9 Kg.) occurred during the course of the complaints. The only positive physical finding was some spasm in the right upper quadrant. Roentgenologic examination of the gallbladder showed no evidence of disease. Gastrointestinal examination revealed that, radiologically, the stomach was normal in size and position. A constant deformity involved

the midportion of the lesser curvature. It appeared as a diverticulum, which could be the result of a penetrating ulcer or an old walled-off perforation. The stomach emptied in six hours, but barium persisted in the diverticulum. The intestine showed no abnormalities. The patient went home for a few days to consider operation.

Fig. 1.—Large deformity in pars media, apparently a deep penetrating ulcer on the lesser curvature.

At this hospital, to which he was admitted Jan. 16, 1942, the man gave a history of four attacks of pain beneath the left ribs during the past three years. Loss of appetite and vomiting two or three times daily lasted for a week. Burning pain under the left costal margin radiated to the left scapula and was relieved by vomiting. The vomitus was acid and yellow. Hematemesis and melena were absent. The bowels had been regular except for constipation during the attacks. The usual weight was 190 pounds (86 Kg.). Before the last attacks the weight was 172 pounds (78 Kg.). No treatment had previously been sought for these attacks.

The symptoms which initiated the present hospital studies consisted of heartburn followed by burning pain beneath the left costal margin two to three hours after meals and at about

Fig. 2.—Appearance one month later, showing two separate lesions, a penetrating ulcer of the lesser curvature, just below the cardiac opening, and a persistent prepyloric deformity, suggesting a second ulcer.

4 a. m. The pain was relieved by food and at times by eructation. For the first two or three days of the attack the pain was also relieved by vomiting.

Physical Examination.—Few abnormalities were noted. The patient was tall, appeared to be undernourished and weighed 144 pounds (65 Kg.). The tongue was coated. The blood pres-

sure was 104/72. The liver edge was palpable two finger-breadths below the right costal margin in the midclavicular line. No other pertinent findings were discovered.

Laboratory Examination.—Urinalysis was normal. A microcytic anemia of moderate degree was present. The blood non-protein nitrogen was 56 mg. per hundred cubic centimeters on one occasion. The feces contained occult blood while the patient was on a modified Sippy diet. The blood Kahn test was negative.

Roentgenologic examinations were made by Dr. E. F. Merrill. On Feb. 19, 1942 fluoroscopic examination of the esophagus revealed no evidence of disease, but there was a very large deformity of the pars media of the stomach apparently as the result of a deep penetrating ulcer on the lesser curvature. This is best shown on a film which was made at the time of the fluoroscopic examination (fig. 1). About 3 ounces of the opaque mixture was still in the stomach at the end of six hours. On March 18 examination of the stomach showed fluoroscopic evidence of two separate lesions, mainly a penetrating ulcer of the lesser curvature just below the cardiac opening, which now showed up well on the film (figs. 2 and 3). A persistent deformity in the prepyloric region indicated the possibility of a second ulcerative lesion in that position. No gastric retention was noted, and no sign of duodenal or small bowel lesion was seen. On March 25 a third examination of the stomach with

Fig. 3.—Different view from that presented in figure 2.

films made at the time of the fluoroscopic examination confirmed the finding of two ulcerating lesions in the stomach. They were well shown on films made at the time of the fluoroscopy.

Course.—During a prolonged preoperative course the patient was comfortable, except for occasional abdominal pain. Over a period of three and one-half months he gradually improved. March 30 his weight was 157 pounds (71 Kg.).

April 1 the patient was accepted by the surgical service. A partial gastrectomy was done on April 14. Tumor masses were found in the pars media on the lesser curvature and posteriorly, and high on the lesser curvature. There were adhesions to the left lobe of the liver. A sleeve resection of the stomach was done, including the tumor masses. A posterior gastrojejunostomy, with a short loop, completed the repair of the resection. A drain was left in for six days.

Gross Pathologic Examination.—The specimen consisted of the greater portion of a stomach, which included the pylorus, the pyloric sphincter and most of the lesser curvature. Situated in the posterior aspect of the lesser curvature, 7.5 cm. from the pyloric sphincter, was a disklike mass 5 cm. in diameter and up to 2.5 cm. thick. It produced an outward bulge on the curvature, where the attachment of the lesser omentum was scarred. Viewed from the interior of the stomach, the mass was displaced outward, to produce a broad crater-like surface defect with rounded, overhanging and invaginated margins. In profile it could simulate a double ulceration or a diverticulum. The mucosa which covered the lesion was thin but intact, and it was smooth and devoid of rugae. Sectioning revealed the mass to be gray and of dense fibrous consistency at the periphery, but the central portion was composed of a pale yellow necrotic zone

1.8 cm. in greatest diameter. This zone lay between the mucosa and the serosa, and it interrupted the continuity of the muscularis. The serosa was not penetrated by the necrotizing process.

An extra, narrow strip of the stomach also was submitted. Scarred fatty omentum was attached to the serosa. The stomach wall was intact, but within the fat were two small, pale brown lymph nodes.

The gross opinion was that inflammatory granuloma of the stomach existed, with a question of tuberculosis.

Microscopic Examination.—The mass in the stomach wall was composed of a granulomatous inflammatory lesion which contained ramifying abscesses filled with compact purulent exudate. In several sections from different blocks of the tissue there were large and small colonies of ray fungus in the purulent exudate. Dense granulation tissue and fibrous tissue surrounded the abscesses, and this tissue was densely infiltrated with a variety of leukocytes. In the granulation tissue eosinophils and multinucleated giant cells were prominent. The two lymph nodes were embedded in fibrous tissue. The lymphoid tissue was hyperplastic but did not show any active inflammatory reaction (fig. 4).

The pathologic diagnosis was actinomycosis of the stomach wall.

Postoperative Course.—There was slight drainage from the site of the drain, but the sinus was entirely healed at the end of one month. Smears from the drainage showed no actinomyces colonies. The patient was discharged May 26, 1942, six weeks after operation (fig. 5).

Follow-Up Examination.—On Sept. 8, 1943, fifteen months after discharge from the hospital, the patient returned for a check-up. He stated that he had been in perfect health since

The patient appeared to be in good health. Urinalysis showed no abnormalities. The red blood corpuscle count was 4,650,000, the leukocyte count 11,400 and the differential count was normal (bands 1, segmented 74, lymphocytes 23, eosinophils 1, monocytes 1). Stereoscopic posteroanterior films of the chest showed no evidence of disease.

The patient is considered to be cured.

Fig. 5.—Appearance of stomach six weeks after resection, showing good function of gastrojejunostomy.

SUMMARY

Fifteen months after partial gastrectomy for actinomycosis of the stomach the patient was in good health and showed no evidence of extension of the disease. The lesion is considered to be primary in the stomach because of no evidence of pulmonary, upper alimentary tract or intestinal involvement. We believe that this case is probably the only one on record of cured primary gastric actinomycosis.

COMPLICATION ARISING FROM USE OF VITALLIUM TUBE FOR COMMON DUCT REPAIR

RALPH B. BETTMAN, M.D., AND WILLIAM J. TANNENBAUM, M.D.
CHICAGO

One of the difficulties we found in using rubber tubing for repairing defects in common duct injuries was that if the tubes did not pass in a short time they were apt to become plugged with a deposit from the bile. When vitallium tubes came into use we hoped that because of the properties of the metal and because of the shortness of the tube this would not occur. However, a few months ago we found it necessary to remove the first vitallium tube we had used because of biliary obstruction and were disappointed to note that the cause of the obstruction was a thick plug of deposit in the tube.

The history of the patient, a man aged 40, is that he had been operated on for gallstones about a year before we saw him. The surgeon when questioned did not think that he had injured the common duct but did say that the patient drained bile from the abdominal wound for many months after operation and that as the drainage ceased the patient became jaundiced. We operated on him after he had been jaundiced for at least six

Fig. 4.—Section showing portion of abscess in stomach wall, which contains a large and a small actinomyces colony. The surrounding vascular scar tissue is infiltrated with a variety of leukocytes. This scar tissue accounts for the bulk of the inflammatory granuloma. Hematoxylin and eosin.

discharge and had gained 45 pounds (20.4 Kg.). After three months' convalescence he returned to work and had worked steadily. He had abstained from fried foods; he found that cucumbers disagreed with him, but he had had no other dietary trouble.

months; at the time he had a complete obstruction. At operation we easily picked up the dilated proximal part of the common duct and then—not so easily—the distal portion. The two seemed to be separated by about $\frac{1}{2}$ inch of firm scar tissue. We reunited the common duct over an inch long vitallium tube. The patient's jaundice cleared gradually until he appeared normal and had a low icterus index. Then about six months after our operation he became jaundiced again and it was evident that he had another obstruction whether from a stone or from a plugging of the vitallium tube we did not know. We operated on him again, opened the common duct and removed the vitallium tube. The vitallium tube was firmly plugged for its entire length with a thick greenish deposit resembling the deposit which we had seen from time to time previously in the rubber tubes. The common duct otherwise was patent and a pale bile colored fluid gushed from the proximal end. We implanted the proximal end of the common duct into the duodenum, and the patient made an uneventful convalescence with rapid subsidence of the jaundice.

SUMMARY

A biliary obstruction occurred as the result of the plugging of a vitallium tube used in repair of an injured common duct. Judging from the literature this does not always occur, but the fact that it did occur in this case shows that plugging of a vitallium tube may be a possible objection to its use.

104 South Michigan Avenue.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report. HOWARD A. CARTER, Secretary.

ULTRAVIOLET LAMPS FOR DISINFECTING PURPOSES

PRESENT STATUS

W. W. COBLENTZ, PH.D., D.Sc.
WASHINGTON, D. C.

The "Regulations of Acceptance of Ultraviolet Lamps for Disinfecting Purposes"¹ adopted and used by the Council on Physical Medicine have been in force a sufficient time to show that they serve a useful purpose in securing and maintaining a high standard of performance of ultraviolet germicidal lamps.

In my opinion the Council acted wisely at the outset by placing the responsibility on the lamp manufacturer and the distributor for the adequacy of the lamp installation for purposes of radiant disinfection of the air and for the adequacy of the protection from injury of the occupants of the space irradiated.

With the use of ultraviolet disinfecting lamps in their fixtures, as now made and attached to the side walls of schoolrooms, two types of avoidable injury have recently come to my attention. The first type of injury consisted of conjunctivitis and erythema, caused by the ultraviolet rays reflected by the lamp fixture horizontally across the schoolroom into the face of a person standing on the rostrum. Obviously, with a little forethought, this could have been avoided by installing the lamp fixture at a higher elevation or by adjusting the lower edge of the reflector so that the rays could not shine into the face of a person standing anywhere in the room.

The second type of injury reported to me consisted of burns by ultraviolet radiation reflected from the ceiling of a schoolroom on the bald head of the teacher

as well as on that of the investigator who made the ultraviolet intensity measurements. In this case the lamp fixture was of the type made to project the ultraviolet rays vertically (thus impinging on the ceiling) as well as horizontally; and, since the ceiling was made of sound-proofing material that allegedly could not be painted with a material having a low reflectivity of ultraviolet radiation, the intensity at the level of the top of the head of a person standing erect was sufficient to cause erythema and burns. In both cases the intensity of ultraviolet radiation, at the location in the rooms where the injury was reported, was much higher than the maximum permissible value specified by the Council. It is gratifying to know that in both of these instances remedial action was taken. Obviously if the lamps had been properly installed and measurements of intensities of diffusely scattered ultraviolet radiation had been made before occupancy of the room, these injuries would not have happened.

In addition to the aforementioned types of injury is the slow photochemical action caused by low intensity ultraviolet radiation on the skin, producing desquamation of the epidermis of some of the nurses and infants, reported in the Council's "Acceptance."¹ This was remedied by painting the walls and ceiling with a decorative, light blue paint that absorbed these rays. Incidentally it is relevant to note that many paint vehicles (also drapes, wall paper and the like) will be burned brown by ultraviolet rays.

The Council's specification of maximum acceptable intensities of ultraviolet radiation incident on an occupant of a room is based on my radiometric measurements in the aforementioned nursery after it was painted. Of course there has been a wall that the Council's maximum values of acceptable intensities are not "sacred." However, from my contacts with people in nurseries equipped with disinfecting lamps I am fully convinced that the Council's specification of an intensity of ultraviolet radiation of wavelength 2,537 angstroms not exceeding 0.5 microwatt per square centimeter ($0.5 \mu\text{W}/\text{cm}^2$) incident on an occupant for seven hours or less, and not exceeding 0.1 microwatt per square centimeter incident for twenty-four hours a day, is a fair and reasonable requirement that should remain unchanged. This is substantiated by the aforementioned measurements of intensities of ultraviolet reflected from the schoolroom ceiling, amounting to only about four times the Council's specified value (0.5 microwatt per square centimeter) for an occupancy of not longer than seven hours. Nevertheless erythema was caused, showing the low margin of safety that prevailed before the lamp fixture was modified.

The Council's requirements for acceptability of ultraviolet disinfecting lamps (that the concentration of ozone near the occupants of the room shall not exceed one part in ten million) should continue in force.

A recent improvement in germicidal lamps consists in the use of a glass that is highly transparent to the powerful emission line at 2,537 angstroms and is practically opaque to wavelengths shorter than about 2,300 angstroms that generate ozone. This improvement in lamp construction is a tacit recognition of the importance of preventing the generation of ozone by germicidal lamps. Since certain of these lamps do not generate ozone, or at least generate less ozone than other lamps, this could be regarded as an advance in sanitary ventilation.

About three decades ago an elaborate attempt was made to disinfect water on a large scale by ultraviolet

lamps, using hot quartz mercury arc lamps. The presence of suspended matter made ultraviolet radiation an uncertain method of sterilizing water. With the advent of the low vapor pressure, mercury arc germicidal lamps the proposal to sterilize water, particularly individual water supplies (canteens), has been again revived. Laboratory tests show that while cysts of *Endameba histolytica* can be killed by radiation from a low pressure mercury arc (wavelength 2,537 angstroms) lamp, since the effectiveness of such radiation depends on the depth and turbidity of the water, there is no evidence of the practicability of using this method as an adjunct in the sterilization of drinking water. Hence, the point of view expressed in the Council's "Acceptance"¹ regarding the sterilization of solids and of liquids (water) does not require modification.

The outstanding perennial problem is the prevention of classroom air borne spreading of childhood contagions (chickenpox, measles, mumps) and colds by the killing action of ultraviolet radiation, using the newly developed germicidal lamps. The uncertainty of the effectiveness of ultraviolet radiation in preventing colds seems about as great at this date as it was some two decades ago when irradiation of the body with "hot quartz" mercury arc lamps was tried.

There are several reasons for this uncertainty: (1) "the futility of trying to stop colds among school children by irradiating only their classrooms,"² because their surroundings cannot be controlled while they are not in the classroom, and (2) the total intensity of germicidal radiation emitted by each lamp in its fixture, and the total number of lamp units used must exceed a minimum value in order to be effective in reducing cross infection, as noted in the Council's "Acceptance."¹ This is shown conclusively in the studies carried out at the U. S. Naval Training Center, Sampson, N. Y., where observations were made on large groups of recruits housed in barracks that were (1) irradiated with high intensity germicidal lamps, (2) alternate barracks having low intensity germicidal lamps and (3) barracks used as controls in which there were no germicidal lamps.

The results of this investigation,³ which extended over a period of six months (December to May) are impressive and instructive in showing that the incidence of respiratory illness in the barracks irradiated with low intensity ultraviolet lamps followed the same undulations that occurred in the adjacent control barracks, whereas in the barracks irradiated with a high intensity there was a definite reduction in the incidence of respiratory illness—a reduction estimated at 25 per cent for the entire period of observation of respiratory illness in the high intensity irradiated group as compared with the control group, "and not due to chance." Hence, while ultraviolet radiant disinfection of air can be substituted for actual air displacement in reducing cross infection in chickenpox, measles and mumps,⁴ and with less certainty in reducing the incidence of colds, there is no evidence that will justify high pressure sales promotion of ultraviolet disinfecting lamps as a cureall or sureshot preventive of respiratory illness. Disinfection by ultraviolet radiation can serve a useful pur-

pose, but it has its limitations. In this connection it is a satisfaction to record that at least one manufacturer is issuing to its salesmen and distributors a printed guide setting forth factual information regarding ultraviolet disinfecting lamps and some of their shortcomings. Whether this is for self protection (because an "employer need not ask an employee to cheat for him," as the vice president of one large lamp manufacturing concern once remarked to me, years ago) or for altruistic reasons, the booklet should serve a useful purpose in guiding overenthusiastic salesmen as well as the consumer.

Council on Foods and Nutrition

ACCEPTED FOODS

The following additional foods have been accepted as conforming to the Rules of the Council on Foods and Nutrition of the American Medical Association for admission to Accepted Foods

GEORGE K. ANDERSON, M.D., Secretary.

PREPARATIONS USED IN THE FEEDING OF INFANTS (See Accepted Foods, 1939, p. 156)

Campbell Soup Company, Camden, N. J.

CAMPBELL'S STRAINED BEEF BABY SOUP, contains beef broth, beef, tomatoes, carrots, sweet potatoes, white potatoes, egg noodles, onions, celery and salt

Analysis (submitted by manufacturer)—Total solids 13.7%, protein 3.91%, fat 0.9%, carbohydrate by difference 7.6%, crude fiber 0.22%, calcium 0.046%, phosphorus 0.068%, iron 0.40 mg. per hundred grams, copper 0.17 mg. per hundred grams, manganese 0.053 mg. per hundred grams

Calories—15 per ounce.

<i>Vitamins</i> —Vitamin A	1,693 I U per hundred grams
Thiamine	0.037 mg. per hundred grams
Riboflavin	0.072 mg. per hundred grams
Ascorbic acid	3.9 mg. per hundred grams
Niacin	1.29 mg. per hundred grams

Campbell Soup Company, Camden, N. J.

CAMPBELL'S STRAINED CHICKEN BABY SOUP, contains chicken stock, carrots, chicken, scmolina, sweet potatoes, celery, onion, parsley and salt

Analysis (submitted by manufacturer)—Total solids 11.8%, protein 2.63%, fat 1.5%, carbohydrate by difference 6.4%, crude fiber 0.15%, calcium 0.026%, phosphorus 0.042%, iron 0.22 mg. per hundred grams, copper 0.24 mg. per hundred grams, manganese 0.075 mg. per hundred grams

Calories—14 per ounce

<i>Vitamins</i> —Vitamin A	1,766 I. U. per hundred grams
Thiamine	0.018 mg. per hundred grams
Riboflavin	0.040 mg. per hundred grams
Ascorbic acid	1.1 mg. per hundred grams
Niacin	0.77 mg. per hundred grams

Campbell Soup Company, Camden, N. J.

CAMPBELL'S STRAINED LAMB BABY SOUP, contains lamb stock, sweet potatoes, white potatoes, carrots, barley, onions, celery and salt

Analysis (submitted by manufacturer)—Total solids 13.9%, protein 3.09%, fat 2.1%, carbohydrate by difference 7.2%, crude fiber 0.30%, calcium 0.046%, phosphorus 0.068%, iron 0.35 mg. per hundred grams, copper 0.12 mg. per hundred grams, manganese 0.034 mg. per hundred grams

SATURDAY, DECEMBER 22, 1945

THE TERM "DOCTOR" IN AMERICA

Dr. Edward M. Repp of Philadelphia has a question for the medical *Emily Post*. His daily work requires occasional conferences with his druggist and also with the head of a laboratory who examines specimens. Should he address these associates as doctor or mister? In the neighborhood where he resides are also an osteopath, a chiropractor and a chiropodist. These too he meets occasionally while en route on his medical tasks; he never knows whether to say "doctor" or something different. A similar question disturbed Hugh J. McDonald,¹ who discussed the subject not long ago in the *Journal of Higher Education*. A survey of the graduate degrees awarded by the colleges and schools of New York State during 1937 reveals thirteen types of doctors' degrees awarded during the year. The term "doctor," originally the equivalent of teacher or instructor, according to McDonald, seems to have originated among the Romans, who applied it to any one who delivered public lectures or addresses on philosophic subjects. Later in the twelfth century the term was a title of honor borne by men of learning. It was first made an academic title at the University of Bologna in Italy, which received from the emperor the right of appointing *doctores legum* (doctors of laws). The University of Paris followed in 1145. Then the popes granted the universities the right of appointing *doctores canonum et decretalium* (teachers of the canon law). Eventually the study of civil law was combined with canon law, and the title was changed to *doctor utriusque juris* (teacher of both laws). The faculties of theology and medicine followed in conferring the title, but it had been in use for two and a half centuries in other fields before it was conferred in medicine.

The degree of doctor is now conferred in so many areas of learning that the result is confusion. McDonald feels that the conferring of the doctoral degree is in need of a thorough house cleaning. The degree of doctor

of philosophy (Ph.D.) is granted for three years of full time study and examination and the preparation of a thesis following the bachelor's degree. The degree of doctor of science (D. Sc.) is granted for an identical program when the major part of the work is in science. Many times in education, history, literature, economics, sociology and natural sciences the Ph.D. seems to be granted for meeting a standard of mediocrity. Some of the titles of theses have become the butt of humorous remarks, a typical example being a thesis on "The Length of Sentences in Spenser." The conclusion of this important thesis, which was three hundred pages long, was that the sentences in Spenser were of three types—long, short and those which could not accurately be described as either "long" or "short."

As McDonald points out, in the field of ill health the assortment of doctorates now includes the degree of naprapathy, which can be had in ninety days without any entrance requirements; doctor of chiropractic in from one to four years, depending on the school, with the minimum entrance requirement usually just an elementary school education; doctor of surgical chiropody in from eighteen months to three years, with an entrance requirement like that of chiropractic; doctor of optometry three to four years after high school graduation; doctor of osteopathy a minimum of four years, with one year of college work as prerequisite; doctor of public health, with as yet little standardization and, incidentally, available to graduates in bacteriology or related fields after three years' study. McDonald believes that some of these people have about as much legitimate claim to a doctor's degree as would a hotel dishwasher to a D.D.W. Then there are also doctors of medicine, doctors of dental medicine, doctors of veterinary medicine and doctors of dental surgery with better standardized requirements.

The confusion among degrees granted in the field of law is apparent when one remembers that lawyers can get the degree of Bachelor of Laws (LL.B.), Doctor of Jurisprudence (J.D.), Master of Laws (LL.M.) and Doctor of the Science of Jurisprudence (S.J.D.). Each year about a thousand honorary degrees are awarded with Doctors of Laws, of Humane Letters, of Science and of Engineering. The spurious degrees in the field of theology are equally a problem.

Educational authorities might well consider the desirability of some standardization in this area so that the degree of doctor, regardless of the field of learning in which it is applied, will have real significance. Furthermore the public should be able to determine from a title the actual qualifications of the man who adorns himself with it. Finally, the economists who devote themselves to propaganda for revolutionizing medical care persistently trade on their doctor of philosophy degrees and thus perpetrate a fraud on the public, who take it for granted that these "doctors" are physicians.

1. McDonald, Hugh J.: The Doctorate in America, *J. Higher Education* 14: 189 (April) 1943.

CANCER AND CALORIC RESTRICTION

The role of nutrition in cancer has received much attention, since both the developing cancer cell and the growing tumor must obtain sustenance from the metabolic pool of the body. Tannenbaum¹ demonstrated that underfeeding—restriction of the ad libitum intake by approximately one third—invariably caused a significant reduction in the incidence of tumors in mice. This inhibitory effect on tumor formation was noted with all four types of tumors studied—spontaneous mammary carcinoma, spontaneous lung tumor, induced carcinoma of the skin and induced sarcoma—suggesting that many types of tumors respond in a similar manner. Furthermore, the tumors of the underfed groups appeared, on the average, later than those of the full-fed groups. While the reduction in food intake to about two thirds of the normal intake seems drastic, the underfed mice appeared healthy and in general lived longer than the controls.

Tannenbaum suggested that the inhibition of tumor formation through underfeeding (all components and caloric content being reduced proportionately) was due mainly to restriction of calories rather than to restriction of some essential component of the diet. In subsequent investigation² only the carbohydrate content of the diet was restricted, while the protein, minerals and vitamins were maintained constant (caloric restriction per se) and yet the nature and extent of inhibition of tumor formation was similar to that observed in the earlier investigations. Visscher and his associates,³ Saxton, Boon and Furth,⁴ White and his associates⁵ and Rusch, Kline and Baumann⁶ confirmed these observations or extended them to other tumors and to leukemia. Thus there seems to be little question that a caloric restricted diet both reduces the incidence of tumors and delays their time of appearance. At least this statement is valid for all tumors so far studied.

Apparently it is not necessary to restrict the caloric intake greatly to inhibit tumor formation. On the basis of experiments in which the caloric restricted diets ranged from approximately 60 per cent to 90 per cent of the ad libitum intake, Tannenbaum⁷ concludes that any degree of caloric restriction may exert some inhibitory effect on the formation of tumors; however,

the lower the caloric intake, the greater the inhibition. Evidence is also presented⁸ indicating that the inhibition is produced principally during the period in which tumors actually appear (developmental stage) rather than in the period of initiation (preparatory stage); that is, the inhibitory effect is obtained even when the caloric restriction is instituted just before tumors are expected to appear.

All these studies relate to the origin or genesis of tumors and not to the growth of a tumor once it has appeared. Although nutrition may be of some value in the prevention of tumors, the evidence suggests that there is little likelihood that it is of practical help in controlling the growth of tumors.

This dependence of the genesis of tumors in mice on the caloric value of the diet would obviously suggest inquiry into its applicability in human cancer. Tannenbaum's review⁹ of the available insurance statistics suggests that persons of average weight or less are not as likely to develop cancer as are those who are overweight. Obesity and the consumption of more food than the body needs for its current activity appear to be contraindicated.

Other nutritional factors undoubtedly have some effect on the formation of tumors. In the present state of our knowledge, however, caloric intake appears to be the best defined nutritional factor in the formation of tumors. Probably avoidance of overweight, besides being of value prophylactically in diabetes, heart disease and arthritis, may aid in the prevention of many types of cancer occurring in man or, at least, delay the onset. The study of the relationship of nutrition to the origin and growth of tumors appears to be a fruitful and possibly practical field of investigation.

DECELERATION IN MEDICAL EDUCATION

Elsewhere in this issue is a directive of the Selective Service System pertaining to deceleration of medical education. Part 2 of this directive, providing that medical students shall not be required to pursue an accelerated course of study, may require some interpretation for the medical schools and the local boards.

A nonrecurring special study period of about three or four months' duration, in addition to a normal vacation period of three months, will not constitute a departure from the provisions of the directive, provided the medical school assumes responsibility for the work of the students. The school must be able to certify to the Selective Service System that the students engaged in this special study are registered in the medical school and are advancing toward the professional objective of an understanding of medicine. The

work may or may not be done in residence and may include one or more of the following supervised assignments, which must be in the fields of clinical or basic medical sciences: reviews of medical literature, preparation of theses, laboratory or research work, elective medical courses, or informal clerkships in hospitals acceptable to the medical school. Students who have satisfactorily just completed an academic year in the medical school should first be promoted to the next medical class prior to this special study period. Such tuition charges as the school may wish to assess for the special study period can be determined by each school for itself.

The directive of the Selective Service System deserves and will receive the highest commendation by medical schools and medical educators, who will assume the responsibilities involved with seriousness and good faith. Since there is now practically no doubt that the medical A. S. T. P. will be discontinued by the end of the current academic year (along the same lines as the Navy V-12 program), this ruling means that medical schools can now (1) decelerate, if they so desire, with each academic session commencing in the autumn, (2) adjust their calendars to the new internship schedules of the "reconverted 9-9-9 program" (see *THE JOURNAL*, November 24, p. 878) pointing toward annual internship appointments in June and (3) free their clinical facilities for a period of three to six months next spring and summer to provide educational opportunities—perhaps externships—for returning medical officers desiring such training. Any medical school planning special courses for physician veterans should notify the Council on Medical Education and Hospitals at once, so that they can be included in a supplement to the "Postgraduate Continuation Courses for Veteran and Civilian Physicians" published in *THE JOURNAL* December 8. Reprints of these lists are widely distributed in response to a large demand.

Current Comment

BENJAMIN RUSH, M.D. (1745-1813)

The two hundredth anniversary of the birth of Benjamin Rush¹ occurs Dec. 24, 1945. He was a signer of the Declaration of Independence, a public spirited citizen and a distinguished physician. Benjamin Rush was appointed the first professor of chemistry (1768) at the first medical school (of the University of Pennsylvania) in the English Colonies on the American continent at the early age of 23. At the University of Pennsylvania he became associated on the faculty with John Morgan² (1735-1789), the first professor of medicine (1765) in the first medical school in our country, William Shippen Jr.² (1736-1808), Adam Kuhn, pro-

fessor of materia medica and botany, and Thomas Bond (1712-1784), founder with Benjamin Franklin and physician of the Pennsylvania Hospital (1751), professor of clinical medicine, the first professor with this title in America. Benjamin Rush, the "American Sydenham" (Lettsom) was, according to Welch, "the greatest historical figure in American medicine." He described the Philadelphia epidemic (1793) of yellow fever most accurately and noted that mosquitoes were particularly numerous in times of epidemics. He described dengue independently in 1780, although Bylon gave the original description in 1779. He advised the extraction of decayed teeth for the relief of dyspepsia, rheumatism of the hip joint and epilepsy. These interesting case reports were published in his "Medical Inquiries and Observations"³ under the title "An Account of the Cure of Several Diseases By the Extraction of Decayed Teeth." Benjamin Rush received his medical degree at Edinburgh. He was one of the founders of the Philadelphia College of Physicians in 1787. He founded the Philadelphia Dispensary for the poor in 1786. He advocated preventive medicine and introduced a code of medical ethics, antedating Thomas Percival of Manchester, England, considered the "father of a system of medical ethics."

NEW POWDER FOR FUNGOUS INFECTIONS

Fungous infections have been among the more stubborn medical problems in the Pacific war, accounting for as high as three fourths of all sickbay calls at some tropical bases. Some standard remedies useful at home were too irritating in the steaming tropical islands. A new remedy for the condition was tested by Commanders Henry C. Shaw, Marion B. Sulzberger and Abram Kanof, U.S.N.R. The active ingredients of the substance in powder form are undecylenic acid (2 per cent), a fatty acid found in sweat, and its zinc salt, zinc undecylenate (20 per cent), which are mixed with ordinary talc. The remedy can be used in the form of an ointment which contains 5 per cent undecylenic acid and 18 per cent zinc undecylenate in a carbowax base with water, propylene glycol and triethanolamine. The new drug was used on men at the Amphibious Training Base, Fort Pierce, living as they would during an assault, wearing combat clothing, working in the water and under the hot sun. More than 1,800 men employed the undecylenic preparation, more than 2,000 used other preparations, while more than 1,600 used none at all in order to compare results. Fungous infection of the feet developed in 28 per cent of trainees who did not use prevention. Regular dusting with the new powder cut infections to 4 per cent. Under the same conditions 15 per cent developed infection while using powder containing boric and salicylic acids. Groin infections were cut from 10.3 to 0.7 per cent by the powder.

3. Rush, Benjamin: *Medical Inquiries and Observations*, ed. 3. Philadelphia, Pritchard and Hall, 1809 (*The Cure of Diseases by the Extraction of Teeth*), vol. 1, pp. 349-353. In October 1801 Rush attended Miss A. C., who suffered from rheumatism of the hip. In November he directed the decayed teeth to be extracted, and the rheumatism of the hip was cured! He emphasized the connection between the extraction of decayed teeth and the cure of general diseases. Extraction of the decayed tooth in the case of Mrs. J. R. cured her of her dyspepsia. He refers to prior work by Drs. Darwin, Petit and Siebold.

1. Rush was born Dec. 24, 1745, at Byberry, near Philadelphia, and died April 19, 1813.

2. John Morgan and William Shippen Jr. both studied medicine at Edinburgh under William Cullen.

MEDICINE AND THE WAR

SELECTIVE SERVICE

DEFERMENT AND DECELERATION IN MEDICAL EDUCATION

The following State Directive Advise No. 322 was issued December 3 from National Headquarters of the Selective Service System by Lewis B. Hershey.

1. Local Board Memorandum No. 115 provides for consideration for the deferment of registrants who are pursuing a full time course of study in a recognized school of medicine, dentistry, veterinary medicine or osteopathy until their graduation if they have completed a satisfactory preprofessional course prior to their entrance, provided that a student of veterinary medicine should not be considered for occupational deferment

if he commenced his course in veterinary medicine on or after March 15, 1945.

2. Students who are entitled to consideration for deferment under such provisions shall not be required to pursue an accelerated course of study in a recognized school of medicine, dentistry, veterinary medicine or osteopathy, provided that the course of study includes at least nine months of study and not more than three months of vacation in each calendar year.

3. Local boards will consider such students for deferment during the usual three month vacation period if it is certified by a responsible official of the school that the students are, in fact, bona fide students and are satisfactorily pursuing a full time course of study.

ARMY

ARMY TO RELEASE TWENTY-THREE HOSPITALS

Major Gen. Norman T. Kirk, Surgeon General of the Army, recently announced that the Army will release twenty-three hospitals out of its wartime peak of sixty-five by Jan. 1, 1946. These hospitals will be offered to the Veterans Administration or to the former owners of these hospitals. Additional hospitals will be released after the first of the year.

The peak load of hospitals in the United States, reached at the end of June 1945, was 318,000 and has been dropping slowly ever since, despite the influx of men from overseas theaters. The Medical Department estimated that by Jan. 1, 1946 this total will have declined to about 220,000 patients and that by June 1947 there will be only 70,000 men remaining in army hospitals.

The hospitals to be released and the schedule are as follows:

Ashburn General Hospital, McKinney, Texas, December 12; Barnes General Hospital, Vancouver, Wash., December 5; Battey General Hospital, Rome, Ga., December 15; Baxter General Hospital, Spokane, Wash., November 10; Darnall General Hospital, Danville, Ky., December 15; DeWitt General Hospital, Auburn, Calif., December 31; Finney General Hospital, Thomasville, Ga., December 15; Camp Forrest Hospital Center (POW), Camp Forrest, Tenn., December 15; Foster General Hospital, Jackson, Miss., December 15; Glennan General Hospital, Okmulgee, Okla., November 21; Hammond General Hospital, Modesto, Calif., December 21; Harmon General Hospital, Longview, Texas, December 5; Hoff General Hospital, Santa Barbara, Calif., November 10; La Garde General Hospital, New Orleans, November 28; McCaw General Hospital, Walla Walla, Wash., November 25; Camp Pickett General Hospital, Camp Pickett, Va., December 1; Stark General Hospital, Charleston, S. C., October 15; Thayer General Hospital, Nashville, Tenn., December 31; Torney General Hospital, Palm Springs, Calif., November 20; Winter General Hospital, Topeka, Kan., December 1; Camp Butler Convalescent Hospital, Camp Butler, North Carolina, December 15; Camp Pickett Convalescent Hospital, Camp Pickett, Va., October 27; Wakeman Convalescent Hospital, Camp Atterbury, Ind., December 15.

DEDICATE BRONZE PLAQUE OF DR. WALTER HUGHSON

A bronze plaque in memory of the late Dr. Walter Hughson was recently dedicated and established at Deshon General Hospital, Butler, Pa. Dr. Hughson, who for ten years had served as director of the Otological Research Laboratories at Abington Memorial Hospital, Abington, Pa., and associate professor of otology in the Medical School and Graduate School of Medicine at the University of Pennsylvania, died in September 1944. As early as 1942 Dr. Hughson had formulated his concept of rehabilitation of war casualties and had done a great deal of work in the fitting of hearing aids on an objective basis.

The plaque occupies a place of honor in the Aural Rehabilitation Clinic at Deshon General Hospital and was presented to the hospital through the courtesy of the American Rolling Mill Company of Butler, Pa., and of the Nail City Bronze Company, Wheeling, W. Va.

ARMY EXCEEDS QUOTA ON RELEASE OF DOCTORS

The War Department recently announced that the Army's quota of 13,000 doctors to be released to civilian life by December 31 has been exceeded six weeks in advance of the deadline. The total number of doctors who have been separated from the service since VE day reached 13,320 for the week ended November 16. For the same week the total for nurses who have been released came to 20,222 and the dentists' total was 2,460. From a peak strength of over 45,000, all but 11,000 will be out of the service by June 1, 1946, it was stated.

NEW CHIEF NURSE AT GARDINER GENERAL HOSPITAL

Major Floramund F. Difford, A. N. C., was recently named chief nurse at Gardiner General Hospital, Chicago, to succeed Major Nellie M. Denison, who is retiring after twenty-seven years' service with the Army Nurse Corps. A member of the Army Nurse Corps since 1936, Major Difford was serving in the Philippines at the time of the Japanese invasion. After the fall of Manila she and a number of patients and doctors were smuggled out to Australia, where she stayed until November 1944. Since that time she has been stationed in the United States.

COLONEL ESMOND R. LONG LENT TO VETERANS ADMINISTRATION

Col. Esmond R. Long, chief consultant on tuberculosis for the Surgeon General of the Army, was recently lent to the Veterans Administration on request of Major Gen. Paul R. Hawley, acting surgeon general, to assist in establishing a superior standard of care for tuberculous veterans. Colonel Long, who was commissioned in 1942, recently returned from Germany, where he was attached to the public health branch of the Office of Military Government.

REGULAR MEDICAL OFFICERS TAKE REFRESHER COURSES

The Office of the Surgeon General recently announced the Army's new plan to give professional training to regular medical officers who have been on administrative assignments. One hundred doctors already have been ordered to training. Twenty-one of the group are specializing in internal medicine, 33 in general surgery. The others are studying radiology, ear, nose and throat, anesthesiology, neuropsychiatry, urology, pathology, orthopedics, public health and obstetrics and gynecology.

ARMY AWARDS AND COMMENDATIONS

Major Charles Leasum

The Bronze Star was recently awarded to Major Charles Leasum, formerly of Sturgeon Bay, Wis.. The citation accompanying the award called attention to the fact that Major Leasum, "while a prisoner of war in Japanese Prison Camp No. 1, Cabanatuan, Philippine Islands, from October 1944 to January 1945, performed outstanding services as chief of dysentery area and ward surgeon in a general hospital. With improvised, makeshift equipment and depleted medical supplies, he labored against great odds and on a starvation diet. Faced with the problems of malnutrition, deleterious housing and sanitary conditions and the constant danger of food contamination by insects and vermin, he succeeded in controlling epidemics which threatened the entire camp. Major Leasum's devotion to duty, his unflinching courage and initiative, were important factors in maintaining the will to survive among his fellow prisoners of war." Dr. Leasum graduated from Jefferson Medical College of Philadelphia in 1918 and entered the service Dec. 27, 1940.

Major William F. Gassaway

Major William F. Gassaway, formerly of Ellicott City, Md., was recently awarded the Bronze Star for meritorious service from Dec. 25, 1944 to March 19, 1945 near Wingen, Philippsbourg, Behren, Styring, Wendel and Forbach, France. Said the citation, "Under your tireless leadership both the regimental and battalion aid stations functioned in a superior manner throughout this entire period of action against the enemy. In addition, your efforts to prevent and cure trench foot kept the loss of personnel from the cause at a minimum. Your unflinching supervision and your ability in commanding the medical detachment under your control to fulfil the most difficult assignments were an invaluable contribution to the success of the 274th Infantry Regiment." Dr. Gassaway graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1940 and entered the service Aug. 1, 1941.

Major Gerald J. Friedman

Major Gerald J. Friedman, formerly of New York, was recently commended by Lieut. Col. Edward G. Billings, medical consultant in the Office of the Surgeon, Headquarters, South Pacific Base Command, APO 502. The commendation read, in part, "It is indeed a pleasure to commend you for the superior way in which you assisted this office between Feb. 7 and March 1, 1945 in the compilation of data relevant to the incidence, forms and epidemiology of diphtheria infections in this command. You applied your talents diligently and showed great aptitude for sensing the clinical importance of the information at hand. This work which you have done will aid very materially this headquarters in making known its experiences with this infection." Dr. Friedman graduated from the New York University College of Medicine, New York, in 1937 and entered the service June 9, 1941.

Captain James William Urie

The Bronze Star was recently awarded to Capt. James William Urie, formerly of Elmhurst, Del., for heroic achievement on Mount Mapatad, Luzon. According to the citation, Captain Urie received word that five seriously wounded men on the line needed medical attention at once. He moved out immediately with a party of five, over terrain so severe that they were unable to reach the men the same evening. Dr. Urie graduated from Hahnemann Medical College and Hospital of Philadelphia in 1929 and entered the service June 19, 1942.

Lieutenant Colonel Robert O. Y. Warren

A special commendation was recently awarded to Lieut. Col. Robert O. Y. Warren, formerly of Wilmington, Del. According to the citation, "When an evacuation hospital area was flooded by an overflowing river the night of Nov. 2, 1944, Lieutenant Colonel Warren, chief of the medical service of the unit, assumed charge of all medical wards and directed the evacuation of all patients without loss or serious disability to the patients. He then efficiently supervised the continuation of

treatments and medication in effect before the flood. His exemplary leadership, skill and loyalty to duty manifest the fine tradition of the U. S. Army Medical Corps." Dr. Warren graduated from Johns Hopkins University School of Medicine, Baltimore, in 1929 and entered the service July 12, 1942.

Lieutenant Colonel Thomas H. Tomlinson Jr.

The Legion of Merit was recently awarded to Lieut. Col. Thomas H. Tomlinson Jr., formerly of Thomasville, N. C., who, according to the citation, "developed and closely supervised the theater hospitalization program and participated to a great extent in the development of all other theater medical plans. Through his untiring efforts and organizational ability he has successfully coordinated the medical activities in this theater for a period of over thirty-three months." Dr. Tomlinson graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1932 and was commissioned in the United States Public Health Service in 1934.

Major Robert C. Haubrich

Major Robert C. Haubrich, formerly of Pataskala, Ohio, was recently awarded the Bronze Star for his services at Okinawa. A flight surgeon with the 7th Air Force, he accompanied combat airmen on sorties against the Japanese and studied their reactions and equipment in combat in order to provide for more efficient training and equipment. Dr. Haubrich graduated from Ohio State University College of Medicine, Columbus, in 1937 and entered the service May 18, 1942.

Captain Oscar A. Axelson

Capt. Oscar A. Axelson, formerly of Youngstown, Ohio, was recently awarded the Bronze Star for meritorious service in support of combat operations in France, Belgium and Germany as divisional surgeon with the headquarters company of the Third Armored Division. Dr. Axelson graduated from the University of Michigan Medical School, Ann Arbor, in 1930 and entered the service July 30, 1942.

Captain James R. Karns

Capt. James R. Karns, formerly of Baltimore, was recently awarded the Bronze Star for meritorious achievement in South Pacific military operations. Dr. Karns graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons in 1940 and entered the service April 20, 1942.

Captain Frank S. Skura

Capt. Frank S. Skura, formerly of Wilmington, Del., was recently awarded the Bronze Star for his work in the period from Sept. 8, 1944 to Feb. 8, 1945 in France, Germany and Luxembourg. Dr. Skura graduated from Georgetown University School of Medicine, Washington, D. C., in 1935 and entered the service June 20, 1942.

Captain James I. Rhiehl

The Silver Star was recently awarded to Capt. James I. Rhiehl, formerly of Columbus, Ohio, for rescue work under fire at Manila on Feb. 3, 1945. Dr. Rhiehl graduated from the Ohio State University College of Medicine, Columbus, in 1940 and entered the service Aug. 28, 1942.

Major John G. Anderson

Major John G. Anderson, formerly of Lynchburg, Ohio, was recently awarded the Bronze Star for "meritorious achievement in connection with military operations against the enemy" on Mindanao Island, the Philippines. Dr. Anderson graduated from the University of Cincinnati College of Medicine in 1930 and entered the service Aug. 1, 1942.

Captain Stephen E. Muller

The Bronze Star was recently awarded to Capt. Stephen E. Muller, formerly of Baltimore, "for meritorious achievement in South Pacific military operations." Dr. Muller graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1937 and entered the service April 20, 1942.

NAVY

UNITED STATES MEDICAL FACULTY
COMMENDED BY NAVY

A certificate of commendation was recently presented to Dean Francis S. Smyth and the faculty of the University of California Medical School, Berkeley, by the Bureau of Medicine and Surgery of the United States Navy for cooperation in the training of physicians for the naval service. The certificate was accompanied by a letter from Vice Admiral Ross T. McIntire, Surgeon General of the Navy, in which he congratulated the members of the faculty for their contribution to the war effort, and to medical education, stated that he realized the extreme difficulties and obstacles that had to be overcome in accelerating instruction and changing methods in teaching with a faculty depleted by demands of the services and saying "I feel that medical schools have given a most distinguished service which has had considerable effect on the war effort."

Also in connection with the Navy's training program, Rear Admiral C. H. Wright, commandant of the 12th Naval District, sent a letter in which he expressed sincerest appreciation on behalf of the Navy for the contribution of Dean Smyth in screening the Navy V-12 premedical candidates during the past two years. As a result the Navy was provided with the highest caliber of trainees, Admiral Wright stated.

NAVY AWARDS AND COMMENDATIONS

Captain Gordon B. Tayloe

The Legion of Merit was recently awarded to Capt. Gordon B. Tayloe, formerly of Aulander, N. C., "for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as senior medical officer of the United States Naval Group in China from Sept. 29, 1943 to June 5, 1945. Faced with the gigantic task of establishing medical facilities throughout China for the care of American naval personnel and their Chinese allies," the citation continued, "Captain Tayloe moved steadily forward in this cooperative enterprise and, despite difficult problems of supply, transportation and limited personnel, succeeded in setting up medical units in some of the most hazardous and inaccessible parts of China, including many places behind the Japanese lines. By his personal devotion and competent professional supervision, he led his organization in the creation of a remarkable record of health for Americans in some of the most disease-ridden areas of the world and brought the aid of modern medicine to thousands of Chinese guerillas who had never known it before, thereby effecting and maintaining high standards of Sino-American relations, which resulted in benefits to every American in his theater and will be of lasting value to his country. His superb leadership, resolute courage and unwavering devotion to duty reflect the highest credit on Captain Tayloe and the United States Naval Service." Dr. Tayloe graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1927 and entered the service Jan. 28, 1944.

Commander Paul Titus

Comdr. Paul Titus, Pittsburgh, was recently commended by the Secretary of the Navy, James Forrestal, "for outstanding service while on duty in the Personnel Section of the Bureau of Medicine and Surgery. Skilled and untiring in carrying out an assignment demanding the highest qualities of discrimination and thoroughness, Commander Titus rendered distinctive service in establishing a professional standard for intern and residency training in naval hospitals, contributing materially to the care of naval personnel. Prior to appointment and active duty assignment in the Medical Corps of the United States Naval Reserve, Commander Titus was unstinting in his cooperative efforts toward the establishment of professional classification of reserve medical officers and the procurement of important data, obtained at considerable personal expense and inconvenience. His valuable contribution toward the war effort in this specialized field reflects the highest credit on

Commander Titus, his profession and the United States Naval Service." Dr. Titus graduated from Yale University School of Medicine, New Haven, Conn., in 1911 and entered the service July 22, 1944.

Lieutenant Ferdinand Victor Berley

The Bronze Star was recently awarded to Lieut. Ferdinand Victor Berley, formerly of Chicago, "for heroic service while attached to the staff of the Medical Dispensary at Cavite Navy Yard in the Philippines, during and subsequent to the bombing attack by enemy Japanese forces on Dec. 10, 1941. Undaunted by the continuous bursting of enemy bombs," according to the citation, "which rained death and destruction and rendered the Navy Yard a blazing inferno, Lieutenant (then Lieutenant junior grade) Berley administered first aid with prompt and unfailing efficiency despite the danger and confusion. Working rapidly and with resourceful initiative he assisted other medical officers present in caring for more than 100 wounded and injured before arrangements were made to transfer casualties by boat and by truck to the Canacao Hospital, where he continued his valiant efforts during the subsequent evacuation of all patients to the Sternberg General Hospital in Manila. Concerned only for the safety of our sick and wounded, Lieutenant Berley rendered gallant service until ultimately taken prisoner by the Japanese. His steadfast courage, resolute fortitude and self-sacrificing devotion to duty in the face of extreme peril reflect the highest credit on Lieutenant Berley and on the United States Naval Reserve." Dr. Berley graduated from Northwestern University Medical School, Chicago, in 1939 and entered the service Aug. 23, 1939.

Lieutenant Commander Ward W. Briggs

For meritorious service aboard a hospital ship from September 1943 to January 1945 Lieut. Comdr. Ward W. Briggs, formerly of Wilmington, Del., was recently awarded a special commendation at the U. S. Naval Hospital, Corona, Calif. The commendation stated that his outstanding skill was responsible for alleviating suffering and minimizing the loss of life during his tour of duty aboard the hospital ship. Dr. Briggs graduated from Johns Hopkins University School of Medicine, Baltimore, in 1936 and entered the service in April 1941.

MISCELLANEOUS

HOSPITALS NEEDING INTERNS
AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

INDIANA

Caylor-Nickel Clinic, Bluffton. Capacity, 51; admissions, 1,942. Dr. Harold D. Caylor, Director (residents—mixed service, April 1).

MARYLAND

South Baltimore General Hospital, Baltimore. Capacity, 170; admissions, 5,951. William A. Dawson, Director (interns, April 1).

MASSACHUSETTS

Belmont Hospital, Worcester. Capacity, 250; admissions, 1,061. Dr. Huston K. Spangler, Superintendent (resident—communicable diseases; resident—tuberculosis, April 1).

Memorial Hospital, Worcester. Capacity, 215; admissions, 7,713. Dr. Winthrop B. Osgood, Medical Superintendent (3 interns).

NORTH CAROLINA

Charlotte Memorial Hospital, Charlotte. Capacity, 528; admissions, 7,733. Mr. Carl I. Flath, Administrator (residents—physician and nurses—medicine, radiology, pathology).

OHIO

Fairview Park Hospital, Cleveland. Capacity, 201; admissions, 6,170. Mr. Philip Vollmer Jr., Superintendent (interns).

Lima Memorial Hospital, Lima. Capacity, 182; admissions, 5,300. Mr. Leslie Forkelsrud, Superintendent (interns).

PENNSYLVANIA

St. Joseph's Hospital, Lancaster. Capacity, 260; admissions, 5,128. Sister Mary Turibia, Administrator (interns, residents—mixed service).

VIRGINIA

Norfolk General Hospital, Norfolk. Capacity, 393; admissions, 9,871. Mr. R. J. Stahl, Superintendent (interns).

PHYSICIANS SEPARATED FROM SERVICE

ARMY MEDICAL CORPS OFFICERS RECOMMENDED FOR/OR RELIEVED FROM ACTIVE DUTY

Alabama

Majure, Ernest O., Lt. Col., Elmore County Bldg., Wetumpka.

Arizona

Ness, Ansten R., Capt., M-I Hosp., Miami.
Stump, Robert M., Major, 1633 W. Van Buren St., Phoenix.

Arkansas

Hathcock, Alfred H., Major, 400 Washington St., Fayetteville.
McKenzie, Jim, Capt., 602 S. Hamilton, Hope.

California

Anton, Albert N., Capt., 826 S. 3d Ave., Los Angeles.
Ashton, Paul L., Capt., 1249 4th Ave., San Francisco.
Bilker, Daniel, Capt., 333 Gordon Ave., San Jose.
Blount, Lester L., Major, 14 Hatton Ave., Spreckels.
Bochenek, John E., Capt., 620 S. Clela Ave., Los Angeles.
Breger, Samuel, Major, 1502 Vallejo St., San Francisco.
Brown, George E., 1st Lt., 5836½ Camerford Ave., Hollywood.
Brownsberger, Sidney B., Major, 630 Atkins Dr., Glendale.
Calden, Willard S., Major, 66 El Camino Real, Berkeley.
Combs, Robert C., Capt., 8 Santa Ynez Ave, San Francisco.
Conrad, William F., Capt., 132 W. Orange Dr., Whittier.
Corp, Keith W., Capt., Monterey County Hosp., Salinas.
Counter, Henry M., Major, 821 Grand Ave., Buena Park.
Dement, John C., Capt., Rm. B., City Hall, Oakland.
Exelby, Paul A., Capt., 621 E. Penn St., Whittier.
Fishman, Harold C., Capt., 1200 N. State St., Los Angeles.
Fratiss, Anthony M. Jr., Lt. Col., 204 Wayne Ave., Oakland.
Fullenlove, Thomas M., Capt., 450 Sutter St., San Francisco.
Gardiner, Joseph P., Capt., 1506 Stearns Dr., Los Angeles.
Globerson, Irwin, Major, 263½ West Blvd., Los Angeles.
Hilde, Stanley N., Capt., 3972 Main St., Riverside.

Vergosen, Harry E., Major, 9765 N. Martindale Ave., Detroit.
Vida, Alexander, Capt., 137 N. Harrington Ave., Detroit.
Vollmar, George K., Major, 870 Seward, Detroit.
Watson, Douglas I., Capt., 14500 Piedmont Rd., Detroit.
Weiss, Casimir P., Capt., 11814 Wilshire, Detroit.
Wells, Kenneth N., Capt., Spring Lake.

Minnesota

Bailey, Robert B., Capt., Fairmont.
Caspers, Carl G., Major, 4506 Lyndale Ave. S., Minneapolis.
Clark, Henry B. Jr., Major, 594 Montrose Lane, St. Paul.
Cummings, Damon W., Capt., Rushford.
Freeman, William N., Capt., Perham.
Gillespie, Delmar R., Major, 1143 1st St. N.W., Rochester.
Gilman, Lloyd C., Major, Box 58, Atwater.
Goss, Henry C., Major, 1421 Ives Ave., North Glencoe.
Grau, Robert K., Capt., 1375 W. California St., St. Paul.
Heck, William W., Major, 1212 Hawthorne Ave., St. Paul.
Henslin, Merrill E., Capt., LeRoy.
Hollinshead, William H., Major, 911 Goodrich Ave., St. Paul.
Kiesler, Frank G. Jr., Capt., U. of Minn. Hosps., Minneapolis.
Lipschultz, Oscar, Lt. Col., 2790 Xerxes Ave. S., Minneapolis.
Mayo, Charles W., Col., Mayo Clinic, Rochester.
Schmidt, Walter R., Major, Worthington.
Sturley, Rodney F., 1st Lt., General Hosp., Minneapolis.
Troost, Henry B., Capt., 711 Lincoln Ave., St. Paul.
Vanderhoff, Edward S., Major, Excelsior.

Mississippi

Weatherford, W. J., Capt., 729 Washington Ave., Pascagoula.

Missouri

Baers, Harry A., Major, 3945 W. Florissant Ave., St. Louis.
Devereaux, James A., Major, 508 N. Grand Blvd., St. Louis.
Jensen, Joshua E., Capt., 3720 Washington St., St. Louis.
Kelling, Douglas G., Major, Waverly.
Rost, William B., Major, 2422 Duncan St., St. Joseph.
Throgmorton, Howard B., Capt., Park Ave. Apts., Sikeston.
Votaw, Robert E., Major, 10 Warren Terrace, Clayton.
Wade, Frederick E., Capt., 2815 Olive St., Kansas City.
Warson, Samuel R., Capt., 4515A Laclede Ave., St. Louis.
Windmiller, Myrl E., Capt., 2540 Charlotte, Kansas City.

Montana

Bussabarger, Robert A., apt., 219 South Ave. W., Missoula.
Eneboe, Paul L., Capt., 213 S. Willson, Bozeman.
Hammerel, John J., Capt., 233 Avenue C, Billings.

Nebraska

Anderson, Ronald C., Lt. Col., Columbus.
Fellman, Abe C., Capt., 5035 Emmet St., Omaha.
Ohme, Kenneth A., Capt., Mitchell.
Patton, John E., 1st Lt., 4628 Capitol Ave., Omaha.
Rodkinson, Bernard L., Capt., Crawford.
Staley, Sanford O., Capt., 702 S. 36th St., Omaha.

New Hampshire

Brody, Nathan, Capt., 1381 N. Main St., Laconia.
Roe, Addison, Capt., 35 Prospect St., Newport.
Wroblewski, Walter G., Capt., 7 Hall Ave., Nashua.

New Jersey

Bertha, Nicholas A., Capt., 293 S. Main St., Wharton.
Clunan, Ambrose P., Major, 9th St., Prospect Heights, Trenton.
Corson, Kenneth E., Major, Vineland.

New Jersey—Continued

Drake, Willard M. Jr., Capt., R.F.D. 4, Vineland.
Elrllich, Maxwell, Capt., 721 N. Broad St., Elizabeth.
Etheridge, Charles H., Lt. Col., 433 Prospect St., East Orange.
Gribbin, James A., Capt., 836 W. State St., Trenton.
Hamley, John J., Major, 153 2d St., Elizabeth.
Hawkes, Stuart Z., Lt. Col., 84 Washington St., Newark.
Irwin, Francis T., Capt., 253 Bloomfield Ave., Caldwell.
Karslmer, Ernest E., Capt., 927 S. Wood Ave., Linden.
Kohut, George J., Capt., 383 Lawrie St., Perth Amboy.
Kraichik, Louis L., Capt., 100 Bayard St., New Brunswick.
Miller, Reginald C., Major, 1420 Greenwood Ave., Trenton.
Newmayer, Joseph, Capt., 217 Union Ave., Delanco.
Novello, Joseph A., Major, 641 2d Ave., Elizabeth.
Quad, Clifford W., Major, 52 Northfield Ave., West Orange.
Ritota, Michael C., Capt., 301 Henry St., Orange.
Shapiro, Irving, Capt., 108 Schofield St., Newark.
Tansey, William A., Capt., 169 Hobart Ave., Short Hills.
Teschner, Bernard M., Capt., 9209 Hudson Blvd., North Bergen.
Timberlake, Baxter H., Major, 5414 Ventnor Ave., Atlantic City.
Ward, Chauncey P., 1st Lt., 112 Chancellor Ave., Newark.
Watov, Samuel E., Capt., 615 Beatty St., Trenton.

New York

Adalman, Philip, Capt., 1018 E. 163d St., Bronx.
Ageloff, Harry, Capt., 69-81 108th St., Forest Hills.
Baron, Carl, Capt., 618 Ocean Parkway, Brooklyn.
Barrett, William A., Capt., 85 Baldwin Ave., Baldwin.
Beeber, Tobias, Capt., 35-30 153d St., Flushing.
Cacioppi, Thomas R., Capt., 7613 16th Ave., Brooklyn.
Caridco, Henry L., Major, 10 N. Fulton Ave., Mount Vernon.
D'Amanda, William D., Capt., 82 Fulton Ave., Rochester.
Daus, Milton J., Major, 201 S. Franklin St., Watkins Glen.
Davidson, William R., Capt., 184 Deer Park Ave., Babylon.
De Giorgio, Michele, 1st Lt., 3212 Seymour Ave., Bronx.
Earl, Ralph K., Capt., 420 E. 58th St., New York.
Favazza, Armando G., Capt., 1694 64th St., Brooklyn.
Fedcr, Edward P., Major, 155 E. Lincoln Ave., Mt. Vernon.
Gale, Julius P., Capt., 324 S. Wellwood Ave., Lindenhurst.
Geicr, Paul B., Capt., 230 Broadview Ave., New Rochelle.
George, Henry L. Jr., Capt., 320 Holcomb St., Watertown.
Harrison, Francis F., Col., 1 Beaver St., Cooperstown.
Hartmann, Edmund M., Major, 87-88 Parsons Blvd., Jamaica.
Hartwood, Mark R., Capt., 65 South St., Auburn.
Ingegno, Alfred P., Capt., 880 Carrol St., Brooklyn.
Jenkins, Donovan M., Major, 112 South Ave., Webster.
Jensen, Frode, Major, 103 Hampshire Rd., Syracuse.
Kabnick, Arthur B., Capt., 205 W. 88th St., New York.
Kenny, Francis E., Lt. Col., 519 Delaware Ave., Buffalo.
Lamb, Albert R. Jr., 1st Lt., 162 E. 70th St., New York.
Landes, Alexander V., Major, 1706 48th St., Brooklyn.
Lapidus, Bernard, Capt., 2820 Morris Ave., Bronx.
McLaughlin, John J., Major, 202 Lark St., Albany.
McMalon, Robert E., Lt. Col., St. Vincents Hosp., New York.
Maidman, Leonard, Capt., 1321 E. 10th St., Brooklyn.
Minor, Allen H., Capt., 70 Haven Ave., New York.
Moel, Charles S., Capt., 85-32 Parsons Blvd., Jamaica, L. I.
Olson, Carl P., Major, 20 Mozart St., Binghamton.
Olszski, Bronislaus S., Capt., 217 Lake Shore Dr. E., Dunkirk.
Ostrove, Lester L., Capt., Lincoln Hosp., Bronx.
Palanker, Harold K., Capt., 93 Homer Ave., Buffalo.
Palmer, Milton A., Capt., 18 Park Blvd., Lancaster.
Pirro, Nicholas J., Capt., 110 Franklin Ave., Solvay.
Rabbiner, Max, Major, 780 St. Marks Ave., Brooklyn.
Ragosta, Ralph J., 1st Lt., 7521 17th Ave., Brooklyn.
Rather, Lelland J., Capt., 160 Columbia Heights, Brooklyn.
Rivera, Rafael M., Capt., 150 W. 87th St., New York.
Robertson, Euston S., Capt., 776 Avenue C, Arlington.
Robin, Morris J., Capt., 35-43 72d St., Jackson Heights.
Robinson, John N., Lt. Col., 1192 Park Ave., New York.
Schechter, Milton, Major, 875 W. End Ave., New York.
Schutkeker, Bruno G., Lt. Col., 300 Davidson Ave., Buffalo.
Schnur, Jacob, Capt., 1010 Bryant Ave., New York.
Staeb, Frederick D., Major, Highland Hosp., Rochester.
Stanton, Edwin Y., Major, 42-42 Union St., Flushing.
Staub, Philip L., Major, 723 LaFayette Ave., Brooklyn.
Tamse, Sidney, 1st Lt., 902 Montgomery St., Brooklyn.
Tenery, Robert M., Capt., 275 Ft. Washington Ave., New York.
Terranova, Anthony S., Major, 368 Avenue U, Brooklyn.
Untracht, Samuel, Capt., 133 20th St., Laurelton, L. I.
Urbont, Alexander R., 1st Lt., 783 Beck St., New York.
Vitagliano, Eugene, Capt., 4709 Ft. Hamilton Pkwy, Brooklyn.
Von Storch, T. J. C., Lt. Col., 15 Highland Dr. E., Greenvish.
Weisberg, Maurice A., 1st Lt., 41 Lott Ave., Brooklyn.
Zavod, William A., Major, 133 Archer Ave., Mount Vernon.

PHYSICIANS SEPARATED FROM SERVICE

North Carolina

Black, Paul A. L., Major, 218 N. 5th, Wilmington.
Bunn, Richard W., Capt., Reynolds Bldg., Winston-Salem.
Camp, Horton, Major, Camp Hosp., Pittsboro.
Farmer, William D., Major, Banner Bldg., Greensboro.
Gilreath, Robert A., Major, 719 Church St., Hendersonville.
Royster, James D., Capt., Benson.
Schwartz, Benjamin, Capt., Vet. Adm. Fac., Oteen.
Shelburne, Palmer A., Capt., 2602 Sherwood St., Greensboro.
Tart, Braston I. J., Capt., Four Oaks.

North Dakota

Arneson, Charles A., Major, 1110 8th St. S., Fargo.
Krogstad, Loranice T., Capt., Enderlin.
Schatz, George, Major, West Fargo.

Ohio

Aronoff, Nathan, 1st Lt., 36 W. Defiance St., Leipsic.
Ash, Edwin E., Major, Christ Hosp., Cincinnati.
Cook, Robert G., Capt., 3747 Dunkirk St., Cincinnati.
D'Amore, Amanto P., Capt., 1st St., Masury.
Freed, A. N., Capt., 3676 Traynham Rd., Shaker Heights.
Gray, Ralph E., Major, 1430 W. 81st St., Cleveland.
Kattus, Joseph H., Major, 2136 Highland Ave., Cincinnati.
Kaufman, Paul M., Capt., 2321 5th Ave., Youngstown.
Owen, John M., Capt., 4633 N. Dixie Blvd., Dayton.
Rawers, Clarence B., Capt., Bergholz.
Schwartz E. D., 1st Lt., 1720 Middlehurst Rd., Cleveland Hgts.
Shaheen, Gustav S., Capt., 3411 W. Tuscarawas St., Canton.
Taylor, Thomas L., Capt., Montpelier.
Tucker, Harry S., Major, 1840 Ansel Rd., Cleveland.
Urban, John P., Capt., 4475 N. High St., Columbus.
Van Buren, Harlow J. K., Capt., 201 W. Findlay St., Carey.
Wagner, John L., 1st Lt., 226 E. Main St., New London.
Welter, John A., Capt., 250 Outlook Ave., Youngstown.
Williger, Irwin F., Major, 36 N. Pleasant Ave., Osborn.

Oklahoma

Ballantine, Henry T. Jr., Major, 541 N. 16th St., Muskogee.
Nagle, Patrick S., Major, 1021 N. Lee, Oklahoma City.
Noell, Robert L., Major, 913 Med. Arts Bldg., Oklahoma City.
Price, Neel J., Capt., 131 N.E. 4th St., Oklahoma City.

Oregon

Adams, John M., Major, 801 Roseway Dr., Klamath Falls.
Barr, John R., Capt., 1023 Winona St., Portland.
Black, Neil F., Major, 907 Main, Klamath Falls.
Brec, Donald W., Major, 912 S.W. Vista Ave., Portland.
Caniparoli, Sante D., Lt. Col., 3264 N.E. Brice St., Portland.
Durlham, Milton W., Lt. Col., 1506 6th St., LaGrande.
Earl, Charles N., Major, Cottage Grove.
Evans, John W., Major, Route 5, Box 428A, Portland.
Foster, Rae N., Capt., John Day.
Ilge, Alfred H., Major, 1020 S.W. Taylor St., Portland.
Keizer, John P., Capt., 1418 N. Sherman Ave., North Bend.
Lewis, Herbert D., Major, 1115 Montello, Hood River.
McKim, Charles P., Major, 2515 1st St., Baker.
Miller, Robert F., Capt., 4229 N.E. Campaign, Portland.
Ornduff, William W., Capt., 6323 S.E. 29th St., Portland.
Sichel, Martin S., Major, 1730 S.W. Spring, Portland.
Stander, Delbert C., Lt. Col., 321 IOOF Temple, Eugene.
Underwood, F. J., Major, 6450 S.W. Parkhill Way, Portland.

Pennsylvania

Atkinson, Daniel A., 1st Lt., 132 Oakwood Ave., West View.
Baker, Roy F., Capt., Madera.
Capriotti, Octavius A., Capt., 19 E. Broad St., Hatfield.
Carter, Alfred G., Capt., 739 Wheeler Ave., Scranton.
Dickerman, Frederick A., Capt., 6th & Elm St., Watsonstown.
Dickstein, Benjamin, Major, 6013 Delancey St., Philadelphia.
Dietrich, Richard A., Capt., 421 52d St., Pittsburgh.
Diodati, Anthony D., Capt., 1526 S. Broad St., Philadelphia.
Feightner, Francis W., Lt. Col., Penn Albert Hotel, Greensburg.
Flegler, Saul M., Capt., Edgewood Rd., New Kensington.
Forejt, Joseph M., Capt., E. Smithfield St., Mount Pleasant.
Goodman, Harry, Major, 536 Johnston St., Philadelphia.
Gregg, L. A., Lt. Col., Pasadena Dr., Fox Chapel, Sharpsburg.
Hagan, Eugene M., Capt., 904 Washington Ave., Oakmont.
Hammond, Charles P., Major, 134 N. Prince St., Lancaster.
Israel, Harold L., Capt., Sweet Water Rd., Glen Mills.
Winkler, Louis H. Jr., Capt., 921 Delaware Ave., Bethlehem.
Wood, Francis C., Col., Laurel Lane, Haverford.
Woolhandler, Harry W., Lt. Col., 624 W. 21st St., Erie.
Zeman, Erwin D., Lt. Col., 1965 Lakewide Dr., Erie.
Zimmerman, Franklin D., Capt., Schaefferstown.

Rhode Island

Beaudreault, Elphege A., Capt., 244 Lincoln St., Woonsocket.
DeNyse, Donald L., Capt., 922 Park Ave., Cranston.
Gammell, Edwin B., Capt., 1 Main St., Hope Valley.
Menzies, Gordon E., Lt. Col., W. Main St., Wickford.
Ruisi, Joseph L. C., Major, 13 Newton Ave., Westerly.

South Carolina

King, Joseph H., Lt. Col., R.R. 3, Summerton.
Melich, Edward I., Capt., 400 Waccamaw Ave., Columbia.
Pratt, John M., Major, Hickory Grove.
Walsh, John K., Capt., 421 S. Coit St., Florence.

South Dakota

Murdy, Carson B., Capt., 1219 N. Lincoln St., Aberdeen.

Tennessee

Boddie, James B. Jr., Capt., 615 Robert E. Lee Apt., Nashville.
Clarke, Charles L., Major, 2087 Cowden Ave., Memphis.
Coe, Isaac S., Capt., 1208 E. Parkway Blvd., South Memphis.
Currey, Doyle E., Capt., 1320 Lawrence, Chattanooga.
Fort, Garth E., Capt., Riverside Dr., Nashville.
Gayden, Hamilton V., Major, Franklin Rd., Nashville.
Grossman, Laurence A., Major, 3603 Central Ave., Nashville.
Higginbotham, J. M., Major, 1602 Berkley Circle, Chattanooga.
Riggs, James W., Capt., LaFollette.
Swisher, Otto J. Jr., Capt., S. Maple St., Covington.
Thomas, Edward P., 1st Lt., 2410 Jefferson St., Nashville.
Vapner, John B., Capt., 1969 Popular St., Memphis.

Texas

Ashley, R. W., Major, (Bus) 360 E. Olmas Dr., San Antonio.
Aves, Frederick H., Major, Dickinson.
Bannister, Mortimer H., Capt., Pearsall.
Bellamy, Russell M., Major, 806 N. Sommerville, Pampa.
Bunkley, Thomas A., Major, Stamford San., Stamford.
Childs, Tilden L. Jr., Capt., 2118 Stanley St., Fort Worth.
Collins, Robert P., Major, 1411 9th St., Wichita Falls.
Cowan, William K., Major, 4028 McFarlin Blvd., Dallas.
Featherston, Elmer W., Major, General Delivery, Swenson.
Garnett, John W. Jr., Lt. Col., 904 Ft. Worth Natl. Bank Bldg., Fort Worth.
Gooch, Frank B. Jr., 1st Lt., 5315 Harrisburg Blvd., Houston.
Greenlee, Ralph G., Capt., 1107 N. 4th St., Temple.
Hardwicke, Charles P., Major, 1409 Wathen, Austin.
Hartnett, Dalton C., Major, 1015 Travis Ave., Fort Worth.
Howerton, E. E., Lt. Col., Nix Professional Bldg., San Antonio.
Hudson, Isaac F., Lt. Col., 604 E. Reynolds, Stamford.
Jacobson, Harry, Capt., Box 536, Post.
Leach, Charles L. Jr., Capt., 2319 Riverside Dr., Houston.
Loeb, Sam A., Capt., 1101 Pine St., Sweetwater.
McClure, Wayne H., Capt., Box 487, Kermit.
Mozersky, Victor, Major, 301 E. Martin St., San Antonio.
Parchman, Hugh W., Capt., Overton.
Phillips, Gordon, Capt., Haskell.
Poetter, Henry W., Capt., Cameron.
Sanford, Herbert M., Capt., Perryton.
Sears, Ernest S., Capt., 6811 Airline Dr., Houston.
Smith, Gerald S., Capt., 1301 Broadway, Lubbock.
Strickland, John H., Capt., 309 Iowa St., Alice.
Tubbs, Harry A., Capt., Scott & White Clinic, Temple.
Van Beber, J. A., Capt., 306A N. Main, Gladewater.
Wood, W. R., Major, Med. Branch, U. of Texas, Galveston.
Yates, Charles W., Capt., Rosenberg.

Utah

Belnap, Howard K., Major, 2554 Brinker Ave., Ogden.
Gaon, M. D., Capt., Med. Sect. CASC Unit 1902, Ft. Douglas.
Jackson, Henry M., Capt., 141 1st Ave., Salt Lake City.
Voss, Bernard J., Capt., Columbia.

Vermont

Judd, Lester E., Major, N. Main St., Enosburg Falls.
Moskovitz, Abraham J., Capt., 43 Willow St., Burlington.

West Virginia

Barrett, Robert S., Major, Hamlin.
Bowers, Garvey B., Major, Kimball.
Harrison, Charles S., Major, 641 Dale Ave., Clarksburg.
Scott, Charles M., Capt., Groveland Dr., Bluefield.

Puerto Rico

Cabrera, Juan R., 1st Lt., 27 Ashford Ave., San Juan.
Gelpi, William P., Major, Charity District Hosp., Rajardo.
Nieves-Colon, J. de la C., Capt., 33 Gen. Contreras St., Caycey.
Ramirez de Arellano, Max D., Capt., U. of P. R., Rio Piedras.

ORGANIZATION SECTION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CHICAGO, DECEMBER 3-5, 1945

(Concluded from page 1111)

HOUSE OF DELEGATES

First Meeting—Monday Morning, December 3

REPORTS OF OFFICERS

Report of the Secretary

Dr. Olin West, Secretary, presented his report as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

Report of Board of Trustees

Dr. James R. Bloss, Chairman, presented the report of the Board of Trustees as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary, with the exception of the reports of the Bureau of Legal Medicine and Legislation and the Bureau of Public Relations, which were referred to the Reference Committee on Legislation and Public Relations; the report of the Bureau of Health Education, which was referred to the Reference Committee on Hygiene and Public Health, and the Report of the Council on Industrial Health, which was referred to the Reference Committee on Industrial Health.

Supplementary Report of Board of Trustees

Dr. Bloss presented the following Supplementary Report of the Board of Trustees:

1. INSTALLATION OF PRESIDENT ON MONDAY EVENING

The Board of Trustees requests that the House of Delegates suspend the By-Laws and authorize the installation of the President on Monday evening, instead of on Tuesday evening, as provided in the By-Laws.

Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the By-Laws be suspended as requested and the motion was seconded by Dr. Walter E. Vest, West Virginia, and carried.

2. DATE OF THE SAN FRANCISCO SESSION IN 1946

The date selected by the Board of Trustees for the San Francisco Session of the Association is July 1-5, 1946.

3. DISTRIBUTION BY THE AMERICAN NATIONAL RED CROSS OF DRIED BLOOD PLASMA DECLARED SURPLUS BY ARMED FORCES

The American National Red Cross has presented to the Board of Trustees a plan for the distribution of dried blood plasma declared surplus by the armed forces.

4. PROPER UTILIZATION OF SERVICES OF PHYSICIANS IN A NATIONAL EMERGENCY

The following resolution was formulated by a committee appointed by the Board of Trustees after giving consideration to a suggestion made by Dr. James E. Paullin with a view to proper utilization of the services of physicians in a national emergency:

More than 60,000 physicians volunteered and rendered distinguished service in the various branches of the military organization in the war and many more have aided civilian organizations.

During these years of war much experience has been gained by those who served which can be used for the betterment of the organization of military medical service and a more efficient

utilization of medical personnel in the medical departments of the armed forces.

The experience thus gained should be utilized for the benefit of the medical profession and for the military service in any future emergency requiring the withdrawal of many civilian physicians from medical practice.

The Board of Trustees would recommend to the House of Delegates that it authorize the Board of Trustees of the American Medical Association to appoint a committee of seven to be known as the Committee on Military Service. This committee shall include four civilian physicians who served in the war and three others. The committee will study the many communications that have been received and the suggestions made by physicians in the armed forces. The committee will also formulate policies for recommendations to be forwarded through the Surgeons General to the Secretary of War and the Secretary of the Navy expressing the views of the medical profession in planning for proper utilization of the services of physicians in any national emergency.

5. ANIMAL EXPERIMENTATION

With a view to combating legislation intended to prevent animal experimentation, the Board of Trustees has approved in principle the following statement for submission to the House of Delegates:

Much propaganda against animal experimentation has been fostered and disseminated by various poorly informed groups.

The benefits of medical research through animal experimentation have reached a majority of the people of the United States. Many lives have been saved during the war primarily by animal experimentation in the research on blood plasma and various drugs.

The benefits to mankind and to the animal kingdom have been great through the animal research in surgery and medicine, particularly related to rickets, hypertension, lockjaw, hookworm, rabies, diphtheria, diabetes and disterper.

Interference with animal experimentation would cause medicine to cease to progress in many ways.

Because there has been a determined attempt by groups to prevent further experimentation on animals, the House of Delegates of the American Medical Association approves the education of the public in the benefits both to men and to animals from animal experimentation and urges that the people of the United States be completely and thoroughly informed as to these benefits and as to the effect on further progress in research on various diseases, should such animal experimentation be forbidden in any state.

6. MUCH NEEDED ASSISTANCE TO THE PHILIPPINES

Dr. James E. Paullin, in response to a request from the Board of Trustees, made an investigation of medical conditions in the Philippine Islands while on a special mission to various islands in the Pacific area for the Surgeon General of the Navy and prepared the following report for the Board:

While we were on a special mission to various islands in the Pacific area for Vice Admiral Ross T. McIntire, Surgeon General of the United States Navy, permission was given Rear Admiral Winchell M. Craig and me to inquire into the facilities and needs of the Philippine Medical Association and the University Medical School and Hospital and to furnish you and the Board of Trustees of the American Medical Association with the results of this inquiry, thereby fulfilling your requests previously made to me. Of course you will realize that we had time to obtain only a general but fairly accurate view of the situation as it exists today.

The devastation brought on Manila as a result of the war is tremendous. Most of the beautiful public buildings, including the libraries, churches, schools and hospitals, were severely damaged or destroyed by bombings from our forces and more

so by the retreating Japanese. I am informed that the greatest damage inflicted on most of the buildings resulted from high explosives set off by the Japanese after their evacuation in order to prevent any use of the buildings by our forces.

For civilian use there are few or no telephones available. This made communication possible only by mail or personal visits. Your letter addressed to Dr. de Dios, president of the Philippine Medical Association, and Dr. Ayuyao, the secretary, was delivered by Dr. A. G. Sison, dean of the Medical School of the University of the Philippines. I was informed that Dr. Ayuyao had died and I was unable to communicate with the secretary of the society, so that your letter was given to Dr. Sison to be delivered to the secretary.

It requires but little stretch of the imagination to see what happened to the buildings of the University of the Philippines, the medical school, the hospital and the dormitories connected with this university. Many of the doctors were killed in battle or by the Japanese. At this time it is impossible to obtain a complete roster of the physicians in Manila. A very good sample of what happened is a statement from Dr. A. G. Sison, dean of the medical school and professor of medicine in the medical department of the University of the Philippines, to the effect that before the war he had 139 physicians on his staff and today he had 40.

The medical school has reopened and is the only one at this time accepting students. Twenty are enrolled in the first year class. Women are accepted in the same status as men. The hospital, which accommodated 1,000 patients before the war, is now able to take care of only 430 to 450 patients; the wards available for their use have been partially restored, but the patients are crowded. The outpatient department takes care of approximately 500 patients a day. A school of dentistry is part of the medical school. At the present time they have no students.

Not only are students who are selected for admission to the medical school those who have the best scholastic record, but from these are selected those who, after interviews with members of the faculty, are thought to have the qualities essential to make the best practitioners. After entrance into the medical department one failure in any subject is sufficient for dismissal from the school. The curriculum requires four years of college work and one year of internship, and each student is required to engage in some type of research before graduation.

The faculty at the present time is composed of forty members, and, as stated, Dr. A. G. Sison is the dean of the school and professor of medicine. His son, Dr. A. B. M. Sison, is the assistant professor of medicine and secretary of the college. Mrs. A. G. Sison, M.D., is professor of obstetrics and gynecology. We met other members of the faculty, but for the life of me I can't remember their names. Most of them are graduates of medical schools either in the United States or of the University of the Philippines Medical School.

The medical school and hospital are in need of help. They have practically no apparatus. Seven microscopes have been salvaged, and these have to serve the clinical laboratory of the hospital and also the students of the medical school. They have an old x-ray machine which they use with poor results. No high voltage therapy x-ray. There are very few surgical instruments, very few chemicals, no library, few books, very few magazines (and these are quite old), very few x-ray films. All of their hospital records accumulated since 1911 were destroyed or burned by the Japanese. The furnishings in the hospital are extremely meager. The diet is poor and the wards are excessively crowded. However, even though there is a scarcity of paper and no chart backs are available the records of patients are surprisingly good. The notes are full, the histories are good and the recorded examinations are thorough and complete.

It was really pitiful to go through their laboratories, their wards, their x-ray departments, their surgical department and to see how few supplies and how few chemicals they have, and how they would guard the little stains available. Had it not been for the kindness of the medical departments of the Navy and the Army they would not even have these supplies.

I had the pleasure of conversing with Mr. H. W. Endicott, who had just arrived in Manila and is on a commission from the United States government to advise about the disposal of surplus property. I spoke to Mr. Endicott about the needs of

the Philippine General Hospital and the Philippine Medical School, and I am quite sure that those who represent the Medical Corps of the Army and Navy will be quite in sympathy with helping in securing needed supplies for these institutions from our surplus property in this area.

It was very gratifying to me to see how willingly and admirably medical officers of the Navy and the Army were cooperating with Dr. Sison and his faculty in acting as consultants in various departments of his medical school and hospital and how they were helping as they could with teaching. It is with a great deal of pride that Dr. Sison tells of the help which he has received from these volunteer workers of the Medical Corps in both services.

Three of the physicians on the faculty of the Philippines University Medical School have been granted fellowships by the Rockefeller Foundation to come to the United States to study various subjects, one in November, one in December and the other in January.

At the present time the greatest needs of both of these institutions are as follows:

1. A considerable number of all textbooks in medicine, surgery and the various other specialties are needed.
2. They need current medical journals. All are interested in medical journals and they are treasured as extremely valuable property. I happened to see on Dr. Sison's desk an issue of *THE JOURNAL* published in June, which he had just received.
3. The need for surgical instruments of all kinds and accessory apparatus for giving anesthesia and for the care of orthopedic patients is great. They have practically none.
4. Microscopes are needed, as already stressed.
5. X-ray apparatus for fluoroscopic work, x-ray and high voltage therapy, electrocardiographs, chemicals of all kinds for the chemical laboratory, and glassware of all kinds are needed. As a matter of fact the need is great for all supplies to equip a modern hospital.

I am convinced that the American Medical Association can be most helpful to these people by stressing their needs to the profession in this country and through the Surgeon General of the Navy and the Surgeon General of the Army to request that any surplus property not being used for our hospitals at Manila be disposed of through the proper agency to the civilian hospitals in the Philippine Islands and to the University of the Philippines.

To say that there is a tremendous need for physicians in all of the islands of the Philippines to take care of the civilian population is expressing mildly a situation which demands the greatest attention. It requires not only an increase in numbers of doctors but an increase in quality. What has already been accomplished in these localities by the Medical Corps of the Navy and the Army is remarkable, but from our observation we have only scratched the surface of this situation. The Department of Public Health, which is functioning now, is going to need a great deal of help, and until there is better hygiene and better sanitation there will never be better health, and this comes about, as you know, through education of the population as well as better education of physicians.

I hope that this short report will furnish you with a sufficient amount of information to cause the Board of Trustees of the American Medical Association to take the proper steps in helping to accomplish some of the immediate needs of these institutions and of these peoples.

It is believed that most of the activities of the Philippine Medical Association will revolve about the university until communications are better established.

The Board of Trustees has arranged to provide subscriptions to the medical periodicals published by the Association and to send other medical literature thus available to the Philippine Medical Association and to the University Medical School and Hospital. The Board feels that this matter is of sufficient importance to be brought to the attention of the House of Delegates with the suggestion that it urge the United States Public Health Service and the chief of the Federal Security Agency to transfer some of the supplies and medical equipment in the Philippines to the Philippine Medical Association and the University Medical School and Hospital.

7. A PLAN WHEREBY MEDICAL STUDENTS OF APPROVED MEDICAL SCHOOLS CAN BECOME STUDENT MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The Board of Trustees gave consideration to the suggestion adopted by the House of Delegates in 1944 on the recommendation of the Council on Medical Service and Public Relations directing the Board of Trustees to work out a plan whereby students in approved medical schools can become student members of the Association and to prepare the necessary change in the Constitution and By-Laws for submission to the House of Delegates in order to accomplish this purpose.

The Board appointed a committee to draw up resolutions on the subject, which, after approval by the Board, were referred to the Judicial Council.

The Judicial Council made a report to the Board, which then referred the matter back to the Council on Medical Service and Public Relations. That Council at its meeting on Saturday of last week voted to suggest to the House of Delegates that it request state associations to work out the problem on a state level by making possible affiliation with state associations and county societies on an informal basis.

The report from the Judicial Council reads:

REPORT FROM JUDICIAL COUNCIL ON PLAN WHEREBY MEDICAL STUDENTS IN APPROVED MEDICAL SCHOOLS CAN BECOME STUDENT MEMBERS OF AMERICAN MEDICAL ASSOCIATION

The recommendation in the report of the Council on Medical Service and Public Relations requesting "the Board of Trustees to work out a plan whereby students in approved medical schools can become student members of the Association and that the Board prepare the necessary changes in the Constitution and By-Laws for submission to the House in order to accomplish this" and referred by the Board of Trustees to the Judicial Council was considered by that body at a meeting held in Chicago on Dec. 1, 1944. Drs. Donaldson, Noland, O'Shea and Cuniffe were present.

The Council in its report explains the desire for this new membership "so that the students may be inculcated with the ideals and ethics of medicine as early as possible." The suggestion by the reference committee is that this new membership be limited to students in their clinical (third and fourth) years.

At present many county societies have intern members who are not affiliated with the American Medical Association. They attend meetings of the medical society, hear discussions, take part in the activities of the society, learn the advantage of attending these meetings for the acquisition of additional scientific knowledge and see the practical application of the Principles of Medical Ethics of the American Medical Association and the rules of conduct of the constituent association. These can best be learned, it seems to us, in the county society. A membership such as proposed in the American Medical Association, without membership in the county society, would provide members with but one advantage which might possibly help in attaining the end desired by the Council. Medical students now have the same privilege of subscribing to THE JOURNAL as other members, and from THE JOURNAL it is very possible that they would profit in such a manner that it would be worth while both to them and to the medical profession.

It might be well to consider that, although the American Medical Association has no power to control the selection of its members by component societies, yet much might be accomplished by explaining to these county organizations the value of receiving into organized medicine the students in their clinical years.

These memberships would be local, but the students could best be inculcated with the ideals and principles of ethics and with some of the problems they will be compelled to meet in the practice of medicine. This is the only place, we feel, that this can well be done; and a request to our constituent associations to urge the county societies in whose territory is located a medical school or schools to found such a membership may accomplish a great deal. The state of Connecticut has already begun a movement to have the county societies recognize such membership. These students would not be members of the American Medical Association, for it is necessary to hold a

degree of Doctor of Medicine or its equivalent in medicine to be eligible for membership in the American Medical Association. This provision was adopted as part of our Constitution and By-Laws only a few years ago, to be continued as it has been from inception to the present time, a society of graduate physicians. Some component societies accepted as members some of the practicing cultists in a state wherein that cult was legalized. We have no power to compel the component societies to accept or refuse membership, but we can refuse to accept their members who do not meet our requirements as members of the American Medical Association. This proposed recommendation from the Council would compel us to change our Constitution and By-Laws to admit members who are not physicians and thereby change very greatly the character of our Association. Some of these might never become physicians but might practice one of the various cults and could then advertise as a former member of our Association. We believe the least that must be demanded for membership is the successful completion of the recognized medical course.

Members of the American Medical Association, under the present Constitution and By-Laws, are members of constituent state and territorial medical associations, and members of constituent associations are first members of component county or district medical societies. To amend the Constitution and By-Laws of the American Medical Association so as to make it possible to take in medical students as members would be a drastic measure that would in effect upset the whole plan of medical organization in the United States as represented by component county or district societies, constituent state and territorial associations and the American Medical Association. We believe that even if it should be desirable to take medical students who have not graduated into membership in the American Medical Association, such action could not reasonably be taken in a manner that would ignore the component and constituent associations.

As the result desired by the Council can in this instance, we believe, be accomplished by the means herein suggested, we feel that the Constitution and By-Laws should not be amended. However, we heartily endorse the feeling that the result visualized by the Council is the early inculcation of medical students with the ideals and ethics of medicine and we should strive to gain this end. We feel it can be brought about through special memberships in the component societies as described herein. We believe this should be accomplished without amending the Constitution and By-Laws.

This opinion was concurred in by all members of the Council.

8. RESOLUTION REGARDING ADMISSION OF MEMBERS OF MEDICAL STAFF OF VETERANS ADMINISTRATION TO FELLOWSHIP IN ASSOCIATION

The resolutions proposing amendments to the Constitution and By-Laws referring to the granting of Fellowship to medical officers of the veterans' facilities, which were referred to the Board of Trustees last year, were given consideration by the Board and were referred by it to the Judicial Council. That Council submitted a report to the Board which the Board now wishes to refer to the House of Delegates with the suggestion that in view of the probable reorganization of the Veterans Administration it would not seem wise to adopt any new policy until that reorganization has been effected except as far as the local societies may take action with respect to these physicians.

REPORT FROM JUDICIAL COUNCIL ON RESOLUTION REGARDING ADMISSION OF MEMBERS OF MEDICAL STAFF OF VETERANS ADMINISTRATION TO FELLOWSHIP IN ASSOCIATION

The resolution proposing amendments to the Constitution and By-Laws referring to Fellowship for medical officers of the veterans' facilities, introduced by Dr. A. W. Adson in the House of Delegates at the 1944 session and referred by the Board of Trustees to the Judicial Council, was considered by that body at a meeting held in Chicago on Dec. 1, 1944. Drs. Donaldson, Noland, O'Shea and Cuniffe were present.

This resolution requests the American Medical Association to amend its Constitution and By-Laws for the following reasons:

1. To restore Fellowship to members of the veterans' facilities who have been reassigned in states where they hold no licensure

and thus are unable to transfer membership and have lost their membership in the constituent association.

2. To restore Fellowship to those who lost membership in county and state associations through transfers without maintaining their original county and state membership.

3. This resolution also states that a loss of membership in county and state medical associations automatically deprives medical officers of the veterans' facilities of membership and Fellowship in the American Medical Association.

According to the Constitution and By-Laws, a medical officer of the veterans' facilities holding membership in any constituent association can retain that membership when transferred to a different state with the proviso that he does not engage in the private practice of medicine. This allows him to retain his Fellowship through membership in his original state association. A member of the veterans' facilities working on a part time basis must have licensure in that state and therefore must affiliate with a county society within the period of one year or lose his membership. This resolution does not apply to this class but is a petition that we amend the Constitution and By-Laws of the American Medical Association in order to restore Fellowship to those members who have lost it either through carelessness, lack of interest or knowledge of the Constitution.

The second is a request that the members of the veterans' facilities be accepted as members and Fellows of the American Medical Association under the same conditions as pertain to the officers of the Army, Navy and Public Health Service.

There are some disadvantages connected with a membership in the American Medical Association when such membership has no affiliation with the county society. These members are prone not to attend local meetings and may not understand or sympathize with the problems confronting members of that body in the general practice of medicine. They are more likely not to have an awareness of the policies that are currently adopted by the American Medical Association and in general are not acquainted with the activities of organized medicine in the state and county. They are not under the control or guidance of the county society and, we believe, it is generally admitted that the attendance of county society meetings is one of the best means not only of deriving scientific education but also of keeping informed of proposed or accepted economic activities.

It is alleged that medical officers of the veterans' facilities were chosen in a rather haphazard manner in the beginning, many owing their appointments to political recommendations. It may be that considerable improvement has been made in the method of selection; however, at present there is no qualifying examination necessary for appointment and while something has been accomplished to augment the medical training there is no comparison with that provided for those members in the Army, Navy and Public Health Service, where postgraduate courses and successive examinations are demanded of their officers. There is therefore no similarity between the standards required by the veterans' facilities and the Army and Navy medical services. One is qualified by examination and its members are compelled to take special training, postgraduate courses and successive examinations, all of which does not hold true in the veterans' facilities.

The first part of the resolution, which is predicated on the assumption that Fellows of the American Medical Association automatically lose their membership and Fellowship when transferred to a different state, is not supported by the Constitution, which permits them to retain their membership and Fellowship through their original constituent association.

The second request for a change of the Constitution and By-Laws to permit members of the veterans' facilities to become Fellows under the conditions enjoyed by the Army, Navy and Public Health Service was considered at length by the Council. It was felt that, since the same conditions and requirements are not demanded for admission to their respective services, appointments are made without examinations and without postgraduate education, and the standards required of medical officers are so much easier than those of the Army, Navy and Public Health Service, we do not find sufficient merit to warrant a change in the Constitution and By-Laws of the Association.

The members of the Judicial Council were unanimous in the recommendation to the Board of Trustees that this resolution be not supported.

9. CELEBRATION OF CENTENNIAL OF ASSOCIATION

The Board of Trustees wishes to remind the House of Delegates that the one hundredth anniversary of the founding of the Association occurs in 1947 and that plans are under consideration for celebrating that occasion during the annual session in Atlantic City. Meantime a history of the American Medical Association is in process of development and it is proposed to begin its publication in 1946 so that it will be completed in time to permit publication of the complete work for distribution at the time of the Atlantic City session.

The Board would suggest that the House of Delegates authorize the Speaker to appoint a committee to work with the Board of Trustees in the development of a program for the celebration of the Centennial in Atlantic City.

LEGISLATION

A bill, H. R. 4717, proposes to establish a Department of Medicine and Surgery in the Veterans Administration. This bill in its present form provides, among other things, that the chief medical director and the deputy medical director shall be qualified doctors of medicine and that any other person to be eligible for appointment in the medical service of the department of medicine and surgery must be a citizen and must "hold the degree of doctor of medicine or of doctor of osteopathy from a college or university approved by the Administrator, have completed an internship satisfactory to the Administrator and be licensed to practice medicine, surgery or osteopathy in one of the states or territories of the United States or in the District of Columbia."

The Board brings this bill to the attention of the House of Delegates in the hope that definite action will be taken to reaffirm policies already established or to establish new policies.

The Board would call attention to the President's message to the Congress, which includes a health program and which has been introduced with the Wagner bill. This is a matter which the Board feels should be given serious consideration.

The Speaker referred sections 2, 3, 4 and 9 to the Reference Committee on Reports of Board of Trustees and Secretary, sections 5 and 10 to the Reference Committee on Legislation and Public Relations, sections 7 and 8 to the Reference Committee on Amendments to the Constitution and By-Laws, and section 6 to the Reference Committee on Postwar Planning.

Treasurer's Report

The Speaker referred the Report of the Treasurer as printed in the Handbook to the Reference Committee on Reports of Board of Trustees and Secretary.

Report of Judicial Council

Dr. Edward R. Cunniffe, Chairman, presented the Report of the Judicial Council as printed in the Handbook, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

Report of Council on Medical Education and Hospitals

Dr. Ray Lyman Wilbur, Chairman, presented the report of the Council on Medical Education and Hospitals as printed in the Handbook and the following supplementary report, all of which was referred to the Reference Committee on Medical Education:

Supplementary Report of Council on Medical Education and Hospitals

The Council is in full accord with the statement adopted by the Committee on Postwar Medical Service regarding the report of Vannevar Bush to the President on a program for postwar scientific research. This report was published in THE JOURNAL, October 6, pages 466 and 467, and concludes that the Bush report should be supported, subject to certain qualifications set forth, and that "the various agencies represented in the Committee on Postwar Medical Service give consideration to the contents of the subcommittee's report in their public pronouncements and in congressional hearings in which they might be invited to participate and that consideration of proposals and legislation for new federal programs to assist in medical research within restricted areas or specialties of medicine should be delayed until the establishment of some such comprehensive program as that proposed in the Bush report covering all the fields of medicine and natural sciences."

The Council is of the opinion that legislation following the Bush recommendations would be far superior to those of section 213 (pp. 63-65) of Senate Bill 1606 providing for "grants-in-aid for Medical Education, Research and Prevention of Disease and Disability." The provisions of section 213 lack clarity and are unsound. The Bush recommendations are especially superior to the provisions of section 213 in the plan for the establishment and organization of the National Research Foundation.

Respectfully submitted,

RAY LYMAN WILBUR, Chairman.
H. G. WEISKOTTEN.
REGINALD FITZ.
HARVEY B. STONE.
CHARLES GORDON HEYD.
RUSSELL L. HADEN.
JOHN H. MUSSER.
VICTOR JOHNSON, Secretary.

Report of Council on Scientific Assembly

Dr. A. A. Walker, Chairman, presented the report of the Council on Scientific Assembly as printed in the Handbook, which was referred to the Reference Committee on Sections and Section Work, and the following supplementary report, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Supplementary Report of Council on Scientific Assembly

To the Members of the House of Delegates of the American Medical Association:

The Council on Scientific Assembly recommends amendment to the By-Laws of the American Medical Association dealing with the scientific sections as follows:

Change the word "first" in the second line and the word "final" in the third line of section 3, chapter XV, to read "last" and "second" respectively, and delete the last two lines of that section, so that section 3, chapter XV, will read:

SEC. 3. ELECTION OF OFFICERS.—The election of officers of the several sections shall be the last order of business of the second meeting of the section at each Scientific Assembly. To participate in the election of any section a Fellow must have indicated on registering that he desires to affiliate with such section.

Change section 4 (a) of chapter XV by deleting the words "and shall see that proper arrangements are made for his section at the Scientific Assembly," so that section 4 (a) will read:

SEC. 4. DUTIES OF SECTION OFFICERS.—(a) Chairman.—The chairman shall preside at the meetings of the section and shall perform such duties as usually belong to such an office, or as may be provided by the by-laws of the section. He shall cooperate with the secretary in arranging the program.

Change the first three lines of section 4 (e), chapter XV, to read:

(e) *The secretary of the section, with the aid of the Secretary of the American Medical Association, shall provide for meetings of the section.*

Change the word "thirty-five" in the fourth line of section 10, chapter XV, to the word "sixty," so that the first four lines of section 10, chapter XV, will read:

SEC. 10. TIME AT WHICH TITLES MUST BE IN.—Titles of papers to be presented to the section must be in the hands of the secretary of the section at least sixty days before the first day of the

Change section 15 of chapter XV of the By-Laws to be section 16, and insert as new section 15 the following:

SEC. 15. PRESENTATION OF RESOLUTIONS.—No resolution shall be presented before any section later than noon on the second day of the annual session.

Respectfully submitted.

A. A. WALKER, Chairman.
FREDERICK A. COLLIER.
CLYDE L. CUMMER.
EDWARD L. BORTZ.
CHARLES H. PHIFER.

ROGER I. LEE, President-Elect.
MORRIS FISHBEIN, Editor, THE JOURNAL.
OLIN WEST, Secretary. } Ex officio.

Report of Council on Medical Service and Public Relations

Dr. E. J. McCormick, Chairman, presented the report of the Council on Medical Service and Public Relations as printed in the Handbook, which was referred to the Reference Committee on Legislation and Public Relations except the portion of the report referring to amendments to the Constitution and By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws. The supplementary report presented by Dr. McCormick was referred to the Reference Committee on Postwar Planning except that portion which concerns postgraduate medical education in hospitals, which was referred to the Reference Committee on Medical Education:

Supplementary Report of Council on Medical Service and Public Relations

REPORT ON THE SECTION ON PLACEMENT OF MEDICAL OFFICERS

Whereas, the Conference on Public Relations held October 19 and 20 made the following recommendations in regard to the placement of medical officers:

Intern Resident Policy: "It is recommended that the American Medical Association request the Procurement and Assignment Service and the Navy, Army and the Public Health Service to ascertain at the earliest practicable time the future policy relating to the deferment of medical officers to serve as residents in order that hospitals may know the extent to which they may offer additional opportunities to returning veterans to serve as residents."

(This has already been accomplished since the recommendation was made.)

Payments Under Public Law 346: "It is recommended that all discharged medical officers be given terminal leave pay at the termination of their active duty and prior to the expiration of such accrued leave as they may have, thus enabling them to participate immediately in the benefits provided by Public Law 346 (78th Congress, G. I. Bill of Rights). Such a procedure will enable the returned medical officer to commence immediately his training in hospitals or medical schools after leaving the armed services."

Approved Hospital Residencies: "It is recommended that the Council on Medical Education and Hospitals be urged to set up at once a method for the more prompt approval of hospitals for residencies and consider the advisability of giving some temporary approval until formal inspections can be made." The Council on Medical Education and Hospitals and the Specialty Boards are now exploring these possibilities.

The Bureau of Information: "The Bureau of Information of the American Medical Association should be established in a permanent form and maintain adequate records of each physician in the United States from which county and state medical societies could obtain information. The Bureau of Information should also, by the establishment of a cooperative monthly reporting system with state societies, be kept informed of areas needing physicians and from time to time seek information either directly or through state medical societies from individual physicians concerning location, type of practice and other relative data.

"Each state medical society should be urged to establish an information service. This state information service should collect from various public and private agencies data relating to medical facilities, medical personnel or medical needs and other information concerning medical care within the state. This information service should at all times be in a position to furnish information concerning areas in need of physicians and a complete picture of the medical facilities and the physical and economic aspects of any community within the state.

"The American Medical Association should be urged to provide advice or service to such state information services relating to methods of organization and procedure and aid the state services in developing a usefulness to the medical profession and to the people of their states."

Therefore, the Council on Medical Service and Public Relations recommends that the House of Delegates approve these proposals.

Dr. McCormick asked that members of this Council be permitted to introduce resolutions that came from the public relations conference held a short time ago, but the House recessed for luncheon at 1:20 p. m. to reconvene at 3 p. m.

Monday Afternoon, December 3

The House of Delegates reconvened at 3 p. m. and was called to order by the Speaker, Dr. H. H. Shoulders.

Supplementary Report of Council on Medical Service and Public Relations

Dr. E. J. McCormick, Chairman, stated that each chairman of a round table conference held at the Council's conference on October 19 and 20 would like to introduce a report of his conference.

1. Dr. A. W. Adson, Minnesota, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

REPORT OF THE SPECIAL COMMITTEE OF THE CONFERENCE ON VOLUNTARY PREPAYMENT MEDICAL CARE PLANS

Whereas, voluntary prepaid medical care programs, sponsored and operated by the medical profession in many parts of the country, are providing the means whereby millions of persons are able to obtain good medical care and hospital service on a budgeted basis; and

Whereas, this medical care has been rendered in a manner highly satisfactory to both patient and physician; and

Whereas, there are forty-seven voluntary plans in operation in twenty-four states, with almost every other state medical society in the process of developing plans; and

Whereas, in spite of this development some areas of the country have no such programs in operation at the present time; and

Whereas, these voluntary prepayment plans are based on the intrinsic American principles of personal initiative and personal responsibility; and

Whereas, the voluntary type of prepayment plan is to be preferred, in the interest of the people's health, to compulsory care under political control; and

Whereas, a large proportion of the people desire prepayment medical care programs; therefore be it

Resolved, that the House of Delegates take immediate steps to encourage the development of a national voluntary prepayment medical care plan: for the purpose of covering areas not now served by plans, for the purpose of assisting in the enrolment in local plans of national enrolment groups and to serve until such time as all states have their own plans; and be it further

Resolved, that the American Medical Association's Council on Medical Service and Public Relations be instructed by the House of Delegates to take immediate steps to:

1. Coordinate the activities of all prepayment medical care plans now in operation.

2. Foster the development of such plans in those areas where there are none.

3. Educate physicians and the public as to the functions of voluntary prepayment plans and the need for supporting them; and be it further

Resolved, that the officers and committees of every state medical society be urged by the House of Delegates to secure prompt action by their state societies in inaugurating new or increasing the benefits of existing prepayment medical care programs in every state.

Respectfully submitted,

JAMES R. MILLER, Chairman.
A. S. BRUNK.
W. C. CHENEY.
MARTIN I. OLSEN.
JULIAN PRICE.
CARL VOHS.

2. Dr. John H. Fitzgibbon, Portland, Ore., presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

REPORT OF THE SPECIAL COMMITTEE OF THE CONFERENCE ON PUBLIC RELATIONS

The section agreed on the importance of establishing two types of public relations effort: one concerned with the members of the medical profession and various medical organizations, the other concerned with the relations of medicine to the public. The committee was agreed that thorough understanding of public relations by the medical profession is a necessary preliminary to the establishment of efficient public relations with the public and urged on the American Medical Association intensified efforts toward extending such an understanding through the state and county medical associations.

The difficulty of impressing physicians with the need that they inform themselves concerning current problems in social medicine and in medical economics lies in the fact that many physicians do not read the material coming to them through national, state or local medical publications. The proposal has been made that new techniques, such as specific direct-by-mail education or more meetings designed particularly to elucidate medical economics subjects constitute a part of an extended program for medical public relations. The committee calls attention to the value of the regional meetings of the Council on Medical Service and Public Relations.

In the field of public relations for the public, attention is called to the following techniques and proposals which were discussed by this section:

A. Community Health Conferences: In some areas public relations have been immensely benefited by the creation on a community basis of an organization including representatives of the medical and allied professions, the social agencies, management, labor, education and the public concerned with promoting an understanding of health problems and a discussion of the various methods by which medical service may be extended and local problems solved.

B. Radio: The section heard an extended discussion of the use of radio on a national scale by the dramatized network program, the use of prepared records in the form of drama, dialogue and prepared addresses syndicated through local stations, and the use of other radio techniques. Among the problems chiefly discussed were the securing of free time as compared with paid time on the radio, the use of radio for health education and for discussion of social and political problems and the creation of special agencies for utilization of radio such as the effort now being developed in Michigan. The committee representing the section has no conclusions to offer except to point out that the use of radio for health education and for propaganda purposes is still experimental and that within certain limitations medical societies may well test the effects, in their own areas, of the various techniques as well as others which they may create independently. In general, the committee feels that the purchase of time by medical societies either for health education or for informative purposes is questionable, particularly since there are definite restrictions on not-for-profit organizations having to do with funds expended for political purposes. Preferably medical programs should be educational and noncontroversial. Numerous opportunities exist whereby the point of view of medicine may be expressed on well established programs dealing with controversial subjects.

C. Press: The section heard a discussion on the press relationships of the headquarters office of the American Medical Association and also statements from other sections of the country as to the various ways in which the press is being used to educate the public regarding medical policies. These include a Texas program which involves syndication of cartoons and articles in the Texas press, a program in Arizona involving the purchase of space for health education and other material, and programs in which county societies and commercial medical agencies purchase space for informative material. Much is made of the argument that the purchase of some newspaper space creates a kindly attitude on the part of the press toward the medical profession. The committee believes

that here also local considerations must govern both the attitude toward these procedures and the funds to be expended in this manner.

D. Motion Pictures: Already some medical societies are experimenting with the use of motion pictures for health education. Thus far there do not seem to have been made available any motion pictures in the social medical field other than perhaps the "March of Time" program on medical care. The Michigan State Medical Society suggests such experimentation in the field of health education. The Walt Disney films have prospected a considerable number of pictures made with the assistance of federal agencies. In Oklahoma a program is under way for the development of two and three minute trailers on health education subjects to be circulated through all the motion picture houses in the state of Oklahoma. Through the Committee on Medical Motion Pictures of the Bureau of Exhibits of the American Medical Association measures are now being taken to extend to the medical profession and to the public the motion pictures in the field of health developed by various branches of the armed forces.

E. Bureau of Exhibits: The Bureau of Exhibits discussed the value of exhibits of various types. The committee feels that local county medical societies should become more familiar with the exhibit material and the facilities available for the extension of exhibits through the headquarters office and utilize them to the utmost. In several communities the Variety Clubs have become interested in health as their major project. In Chicago the Variety Club devotes its activities to the support of a sanatorium for rheumatic fever. In Minneapolis the Variety Club proposes to construct a building for patients with heart disease as a part of the University of Minnesota Medical School. In Oklahoma the Variety Club has established a health center and proposes to include with it a division for health education and an exhibit.

A proposal was made from Texas that both the American Medical Association and the individual state medical associations engage more liberally in the employment of professional public relations counsels with a view to utilizing such expert services as consultants for the organization of medical society public relations experiments and in various other ways. The California Medical Association utilized professional public relations counsel in analyzing the public opinion of California on medical service. A similar procedure was followed in Michigan. In Texas the state medical society has retained public relations counsel for advice in the development of its program. Several other states also have recently engaged such services. The committee representing the Section on Public Relations urges that the Board of Trustees of the American Medical Association give special consideration to the extent to which such public relations services may be utilized by the Association.

In understanding the public relations effort of medicine, the committee would call attention to the fact that it is now generally recognized that the relations of the individual physician to the individual patient in the United States are on a substantially sound basis. In other words, the public does not express, in general, resentment against the individual physician. The surveys seem to have shown that the public acceptance of the American Medical Association and its policies is favorable so far as concerns scientific progress, health education and protection of the public against inferior medicine and quackery. Antagonism of some elements of the public toward medical organizations seems to rest on the basis that opponents of organized medicine offer a specific program which promises complete medical care on what seems to be a relatively small financial outlay, whereas the medical profession has not yet come forward with a specific program for the extension of medical service on a nationwide basis with a system of payment easily available and sufficiently attractive to insure early enrolment of a large proportion of the public. The task of public relations would be rendered much easier if those concerned could be put in possession of a constructive program which they could promote to the public rather than in a position of continuous defense against programs coming from other sources.

Respectfully submitted,

A. S. BRISTOW.
THEODORE WIPRUD.
MORRIS FISHBEIN.
JOHN H. FITZGIBBON.

3. REPORT OF THE SPECIAL COMMITTEE OF THE CONFERENCE ON FOURTEEN POINT CONSTRUCTIVE PROGRAM

Dr. Louis H. Bauer, New York, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

You recall that last June the Council on Medical Service and Public Relations and the Board of Trustees issued a fourteen point constructive program. This had considerable circulation. Some of the criticisms of it were that the interpretations were not there; just what did these points mean?

Consequently, interpretations of those fourteen points have been made and methods of implementing them have also been made. I am sorry that we do not have a reprint of this whole matter, but you were given this morning a copy of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for December 1 and on page 945 you will find an article entitled "Medical Care for the American People" which covers the fourteen point program, the means of interpretation and the methods of implementation, and I shall not read that to you. It is rather long, it would take nearly a half hour to read it, but you all have it and some of you have had a chance to peruse it.

I will just comment on it briefly. We have been criticized so much because we do not have a positive program but a negative one. Now this program is positive. Of the fourteen points there is only one of them that is of a negative character. That is the one dealing with socialized medicine. We feel that the program might be rearranged and the topics classed into four different groups: The first refers to those that are primarily educational. Right here I should like to interpolate that I was greatly in sympathy with Dr. Kretschmer's remarks this morning in speaking of the county medical society. The county medical society has been waning in its influence, and I think one reason there is that we are too much overorganized in medicine. There are too many subdivisions and too many meetings and the result is that doctors neglect their county society, and if one does go to a county society meeting one is fortunate to see 10 per cent of the membership there. It is usually the same 10 per cent always in meeting after meeting.

We cannot get very far unless we can interest the members of the profession in our immediate problems and not leave them in the hands of a few like this House of Delegates and the house of delegates of our state societies.

The second group refers to those that call for positive legislation. The third group refers to those that call for positive action but not necessarily legislative action, and the fourth group refers to those that we call negative, namely pertaining to the Wagner-Murray-Dingell bill and other types of vicious legislation. On page 948 of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for Dec. 1, 1945, in the interpretation of item 12 there is already a little obsolescence, although it was written less than two months ago. A new Wagner-Murray-Dingell bill has been introduced and comments appearing in THE JOURNAL are on the previous one. Most of them are still pertinent to this same bill. We have prepared an amendment to this but, as the Board of Trustees has referred the matter of the President's message and this bill to the House, which will draw up its own policy on these subjects, it did not seem wise to have two reports on the same subject. We merely suggest that whatever the House adopts in this regard be implemented into the official interpretation of this twelfth point.

I think it is very important that we have not only education of the public in making this positive program one which would be effective but that we have unity among ourselves in carrying it out. We cannot go very far if we are a house divided against itself. I feel that it is time that we cleared up the word "reactionary." The people who are opposing compulsory sickness insurance have called us reactionary. I know of nothing which is more reactionary than compulsory sickness insurance, for which there have been proposals for over thirty years in this country and the various states, and for a number of years nationally.

It is the same old proposition that dates back to Bismarck with a few new dressings added to it in the hope that it will delude the public into thinking it is something new. It is, of

all things that have been proposed for delivery of medical care, the most reactionary. I think it is time we caught them with their own stick.

Now we have a lot of problems thrust on us, but I don't think we should adopt a defeatist attitude. I have heard doctors say "This is inevitable, we might as well get on the bandwagon and go along with it. We can't stop it." Of course we can't stop it if we take that attitude. There is a paragraph in this article on that very subject and it says that the only thing inevitable is the—I will quote: "Investigation of specific symptoms usually reveals that the only inevitable feature of the march toward collectivism is the determination of the little group which wants to collectivize."

We defeated other bills of this character and I am certain that if everybody will work together and get the profession itself as a whole interested, and not just a few, we can defeat this.

Well now, gentlemen, we have our troubles and they seem to be increasing; but if our opponents have any idea we are ready for the hospital they are due for a rude awakening.

4. REPORT OF SPECIAL COMMITTEE OF THE CONFERENCE ON LEGISLATION

Dr. James R. McVay, Missouri, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, the Conference on Public Relations held October 19 and 20 made the following recommendations in regard to legislative matters:

"We highly commend the opening and development of the Washington office. In its first year of operation it has demonstrated its usefulness and the committee recommends its further expansion and that necessary financial support be continued.

"We further recommend that each state association be invited to appoint a special national legislative committee, consisting of at least five men composed of the president, secretary and three other members, in those states which do not now have active legislative committees. The function of this committee will be to determine the opinions and wishes of the profession and to keep the Council office and the Washington office informed of the attitude of the Senators and Congressmen from their respective states. The Council and the Washington office will in turn continue to disseminate information regarding legislative action and opinions expressed by members of Congress from various states. A two way flow of information is thus encouraged. In view of recent national legislative developments it is recommended that the House of Delegates urge intense activity of each state committee."

Therefore, the Council on Medical Service and Public Relations recommends that the House of Delegates approve these proposals.

5. REPORT OF SPECIAL COMMITTEE OF THE CONFERENCE ON EXTENSION OF THE EMERGENCY MATERNAL AND INFANT CARE PROGRAM, POSTWAR

Dr. Thomas A. McGoldrick, New York, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

The conference unanimously disapproves the present super E. M. I. C. bill, S. 1318, and calls on the members of the entire medical profession for personal disapproval.

Whereas, it has been authoritatively and repeatedly announced by the Children's Bureau that the E. M. I. C. would be completed six months after termination of the war; and

Whereas, we feel that the objects of this program have been attained, viz. to sustain "the morale of the soldier" and it has been accomplished through the cooperation of the medical profession; and

Whereas, the need of this emergency measure is rapidly diminishing in importance; and

Whereas, there is a definite move to continue this program and provide for its application to the people of the entire United States and with widened scope and expanded power centralized in the Children's Bureau (S. 1318, Pepper bill); and

Whereas, we feel this plan should not have general application throughout the United States because (a) there is no real need for the continuation and expansion of this wartime measure, (b) such compulsory plans are not consistent with good care, excellence of service or American principles, (c) because the inclusion of children to the age of 21 is not required and their medical needs can be met more efficiently in other ways and (d) no health work or medical service that can be rendered by a state or any of its political subdivisions should be administered or controlled by the federal government or any federal bureau; therefore be it

Resolved, that the present Medical Advisory Committee to the Children's Bureau is not truly representative of the entire medical profession.

Any program of that bureau must be administered through the state medical associations, which should be represented; and be it further

Resolved, that the present advisory and steering committees to the Children's Bureau be abolished and a new committee be established which shall consist of one representative from each state medical association to be designated by that association, and representatives from such other medical organizations as have a direct interest in the functions of the Children's Bureau selected by these organizations; and be it further

Resolved, that since the Children's Bureau is not properly related to the Department of Labor it should be transferred to the Federal Security Agency until such time as all health and medical activities of the government are segregated into a single department; and be it further

Resolved, that the fourteen point program of the American Medical Association, and such resolutions as may be adopted by this conference, be forwarded through the proper channels to the Children's Bureau and the Federal Security Agency to bring before them the policies of the profession on the medical economies of maternal and child welfare; and be it further

Resolved, that, in the distribution of any funds appropriated by the Congress for health and medical services for the use of the separate states, the state medical associations be integrated into the control of the expenditure of such funds; and be it further

Resolved, that the American Medical Association, through the proper channels, be requested to take action to present the foregoing resolutions to the proper authorities and endeavor to have them put into effect.

It is recommended that every state medical association through the members of its component societies personally place before their representatives in Congress the defects in the bill, the harm that would result from its enactment into law, the dangers resulting from compulsory central government measures and the retardation of our medical progress and also emphasize the medical policies favored and promulgated by these resolutions.

A copy of the recommendations of the general conference on the super E. M. I. C. bill, S. 1318, should be forwarded to every representative in the Congress, to the Secretary of Labor, to the Federal Security Agency and to every state and county medical society.

Report of the Committee on Postwar Medical Service

Dr. Ernest E. Irons, Chairman, presented the following report, which was referred to the Reference Committee on Postwar Planning:

At the meeting of the Board of Trustees on Feb. 18 and 19, 1943 Dr. James E. Paullin, then President-Elect of the American Medical Association, presented a plan for postwar medical service. The Board of Trustees endorsed the proposition that the American Medical Association take leadership in the matter with the cooperation of committees of the American College of Physicians and the American College of Surgeons, and a joint committee was formed. The first meeting of this joint committee was held in Chicago on June 5, 1943. It was largely exploratory, and the general objectives were discussed.

The matter came before the House of Delegates in June 1943 in the address of President-Elect Paullin and was referred to a reference committee. The reference committee reported as follows:

Your reference committee notes with enthusiasm the formation by the Board of Trustees of the temporary Committee on Planning of Postwar Medical Service, which action it recommends be approved by the House of Delegates.

Your reference committee further recommends that the Board of Trustees be instructed to make this a permanent Committee on Planning of Postwar Medical Service to cooperate and collaborate with other agencies concerned with these problems.

As the organization and scope of the committee progressed, it became evident that liaison members from a number of organizations should be added. The organizations and agencies so included are:

Advisory Board for Medical Specialties
American Dental Association
American Hospital Association
Association of American Medical Colleges
Catholic Hospital Association
Federation of State Medical Boards
War-Time Graduate Medical Meetings
Office of the Surgeon General, U. S. Army
Bureau of Medicine and Surgery, U. S. Navy
U. S. Public Health Service
Veterans Administration
War Manpower Commission
Procurement and Assignment Service
Federal Security Agency

In all, some fourteen meetings of the committee have been held, as often as matters requiring consideration came up, usually at intervals of about two months and when transportation facilities could be arranged. At each meeting representatives of official agencies of the federal government immediately concerned with the prosecution of the war have been present.

Dr. Roger I. Lee, who was responsible for the early meetings of the committee and accomplished its organization, was obliged to resign on account of the press of new duties, and the present chairman was appointed by the committee.

Many questions have been referred to the committee, and a number of these have been made the subject of special reports by subcommittees. The proceedings of the committee have been regularly published in *THE JOURNAL*, as follows:

Sept. 25, 1943, p. 221	Dec. 16, 1944, p. 1036
Oct. 30, 1943, p. 574	Jan. 13, 1945, p. 107
Feb. 12, 1944, p. 447	March 17, 1945, p. 658
March 18, 1944, p. 784	May 12, 1945, p. 138
May 13, 1944, p. 157	June 16, 1945, p. 523
July 8, 1944, p. 726	Aug. 4, 1945, p. 1033
Sept. 23, 1944, p. 243	Nov. 17, 1945, p. 812

At the outset, it was recognized by the committee that any decisions or pronouncements which it might make could be advisory only. However, it is believed that many of the committee's reports and actions have been helpful to physicians in the armed services and also of value to the armed forces themselves in the prosecution of the war and in preparing for the peace to follow. Surprise has sometimes been expressed that the mere reference of a problem to the committee did not at once result in a complete solution. As already noted, by the very nature of its organization the Committee on Postwar Medical Service could be advisory only but could, by collecting all of the information on any one subject, bring the combination of the facts to a focus which would contribute to a sensible solution. While the work of the committee has been of distinct service in many situations, the committee is keenly aware that it has not always been able to effect solutions of problems entirely satisfactory to their proponents. The committee has been guided throughout its work by the principle of service to physicians, both military and civilian, to the prosecution of the war and to the welfare of the civilian population.

The following are some of the problems handled by the committee.

Through the efforts of a subcommittee and the efficient help of Lieut. Col. Harold C. Lueth, liaison officer, pilot questionnaires were sent in the early part of 1944 to 3,000 medical officers

and, when returns had been studied, a revised questionnaire was sent to each medical officer on active duty with the Army, Navy, Public Health Service and Veterans Administration. Reports on the analysis of 21,029 returned questionnaires were published in *THE JOURNAL*: "Results of Pilot Questionnaire to Physicians in Service," June 24, 1944, p. 558; "Future Educational Objectives of Medical Officers," Aug. 19, 1944, p. 1099; "Postgraduate Wishes of Medical Officers," March 31, 1945, p. 759; "The Medical Officer Returns to Civilian Practice," April 21, 1945, p. 127.

One of the most important activities sponsored by the committee is the establishment by the Board of Trustees on authorization of the House of Delegates of a Bureau of Information in the headquarters offices of the American Medical Association. Lieutenant Colonel Lueth aided greatly in the setting up of the Bureau and in defining and organizing the scope of its work. The aims of the Bureau are to provide veteran medical officers with information concerning educational opportunities, state licensure and medical, social, financial, economic and other phases of community life that will enable them to make a selection of a location in which to practice medicine. The Bureau is not meant to be a placement or employment agency. After returning physicians have been given all available information by the Bureau, they are referred to state, county and local medical society committees. Various methods for obtaining and making use of all pertinent data have been devised. The committee is keenly appreciative of the assistance given by state and county societies and by state boards of procurement and assignment. Constantly increasing numbers of returning medical officers are making use of the facilities of the Bureau. An article entitled, "The Bureau of Information, Its Function and Operation," appeared in *THE JOURNAL* for Jan. 6, 1945. An Information Bulletin for Medical Officers was prepared by the Bureau of Information and was distributed very widely in the late summer of this year. Lieut. Col. Robert D. Bickel, who succeeded Lieutenant Colonel Lueth as liaison officer, was extremely helpful in the conduct of the Bureau.

The Subcommittee on Graduate Education of Physician Veterans had a number of conferences with various officials of the Veterans Administration. A report of this subcommittee appeared in *THE JOURNAL* for Nov. 11, 1944.

The matter of the supply of medical and premedical students received the earnest consideration of the committee, and the Subcommittee on Enrolment of Medical Students has held many conferences with officials in Washington and is still working on the problem. A report was published in *THE JOURNAL* for April 7, 1945.

A problem of grave concern to all medical officers in the armed forces arose early in 1945 in that a number of such officers were transferred by presidential directive to service with the Veterans Administration without regard to their own wishes in the matter. The Committee on Postwar Medical Service at its meeting on May 12 adopted a strong statement deprecating this practice, which was forwarded to the appropriate government officials.

The Subcommittee on Surplus Medical and Hospital Supplies has been active, and its reports have appeared in *THE JOURNAL* from time to time as a part of the proceedings of the committee.

The matter of state licensure for physician veterans has been given serious attention at many meetings of the committee. The minutes of the meeting held on Sept. 22, 1945, contain a report on this problem.

The demobilization of medical officers was the subject of study by the Subcommittee on Formulation of Lists of Medical Officers to Be Considered for Demobilization.

Pursuant to the enactment of the so-called G. I. Bill of Rights, a subcommittee was appointed to draw up recommendations to the governors of the states concerning medical education and postgraduate training under the G. I. bill, and subsequently a letter was sent to the governor of each state, territory and the District of Columbia setting forth the committee's ideas and recommendations, with a view to preventing the exploitation of veterans by unqualified and cultist schools. The response

of the various governors was cordial and favorable. A report of the Subcommittee on Graduate Education of Physician Veterans, in which rights of the physician under the G. I. bill are set forth, appeared in *THE JOURNAL* for June 16, 1945, and another in *THE JOURNAL* for August 4.

A report of the Subcommittee on Establishment of a Medical Corps in the Veterans Administration appeared in the proceedings of the committee printed in *THE JOURNAL* for May 12, 1945. Since this report was submitted a program for reorganization of the Veterans Administration has been inaugurated and at the time of writing of this report a new bill (H. R. 4225) has been introduced by Representative Rankin. The Committee on Postwar Medical Service is favorably impressed with many of the provisions of the Rankin Bill.

The Vannevar Bush report advocating the establishment of a National Research Foundation by the federal government has been considered by the committee, which adopted a report of a subcommittee recommending, subject to certain qualifications, that the Bush report receive the support of the Committee on Postwar Medical Service, and that consideration of proposals and of legislation for new federal programs to assist in medical research within restricted areas or specialties of medicine be delayed until the establishment of some such comprehensive program as that proposed in the Bush report covering all fields of medicine and natural sciences. The report of the subcommittee was published in *THE JOURNAL* for Oct. 6, 1945.

The Committee on Postwar Medical Service is much interested in plans for aiding returning medical officers that are being or may be promulgated by local or state medical societies. It also is concerned over what may be done to alleviate the plight of the medical profession and of medical education in the Philippines.

The committee is continuing its consideration of uncompleted problems and will take up new ones as they arise.

Respectfully submitted to the committee.

ARTHUR W. ALLEN, Vice Chairman.

ERNEST E. IRONS, Chairman.

H. H. SHOULDER, Secretary.

Report of Committee on Rural Medical Service

Dr. F. S. Crockett, Chairman, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

The Committee on Rural Medical Service was created by the Board of Trustees last June following an invitation to confer with a like committee of the American Farm Bureau Federation. The Associated Women of the American Farm Bureau Federation represent some 850,000 farm families, comprising initially the membership of the American Farm Bureau Federation. Its interest in the health problems of farm families and farm communities has been active for some time.

The importance of cooperation with farm groups in health matters, in the opinion of the Board of Trustees, was amply demonstrated by those appointed with me: Dr. C. W. Roberts of the Board of Trustees, Dr. E. J. McCormick, Chairman of the Council on Medical Service and Public Relations; Dr.

Victor Johnson, Secretary of the Council on Medical Education and Hospitals, and Dr. Olin West, Secretary and General Manager of the American Medical Association. Later, Dr. L. W. Larson, secretary of the North Dakota State Medical Association was added for his familiarity with rural conditions in the Northwest. It is hoped to find others with similar special knowledge of other agricultural sections, who can contribute much in finding a solution for existing medical problems.

From 1936 to 1938 the Committee on Legislative Activities met on several occasions with the Associated Women of the Farm Bureau to consider this same subject of rural medical service. As a result of these meetings we have all learned much.

In July this year your committee met with the Rural Health Committee of the Farm Bureau as their guests. The current rural health situation was reviewed. The growing scarcity of physicians in farm communities is producing a situation that creates alarm among those living in these areas. The reluctance of young physicians to seek locations in the smaller communities, at a distance from good hospital facilities, as well as the advancing age of those now so located, was cited as reason for this concern. This is not a local situation but exists in nearly all states of the Union.

The Hill-Burton bill was favored especially in its possible effect on rural practice. It seemed reasonable to believe that the development in rural communities of centers where diagnostic aids together with public health and other kindred activities could be housed, would attract well trained physicians. It seems quite possible that federal legislation of this kind could be instrumental in improving the quality of medical practice in rural America without placing the profession in a legislative strait jacket.

The Farm Bureau is opposed to federal health legislation of a compulsory type and has appeared to testify against such pending legislation in the Senate.

With the one exception of the Farmers Union, all farm groups have adopted a constructive attitude toward and have registered themselves opposed to compulsory socialized medicine. The nature of their work and the semi-isolation of their living develops them as self-confident individualists, impatient with restraint or limitation of their freedom. We as a medical profession have many things in common with them, many areas of agreement, of approval as well as disapproval where federal legislation is proposed. They are our natural allies in the fight to preserve this nation from regimentation, and it is to our mutual advantage that we work in close harmony.

In the July meeting with the Farm Bureau, our discovery of parallel points of view on health problems made it desirable to take full advantage of cooperation at all levels. The American Farm Bureau, like our American Medical Association, is not organized to work on a state or county level. That must be done by state farm bureaus and county farm bureaus. It was agreed that both organizations would invite the component state groups to appoint rural health committees to cooperate in the exploration and solution of local health problems.

In furtherance of this plan, your committee has written all state associations asking appointment of rural health committees. To date, committees have been appointed and reported to us by twenty-five states. These committees have been created in response to an appeal for help from the Farm Bureau, and the Grange with all interested farm and community groups should enter this activity. The need is very urgent and calls for action now.

While it is recognized that every one in the community must contribute his full share in any plan, we, as the medical profession, are expected to supply many of the answers in the solution of this problem. It might appear that the supplying of well qualified physicians and adequate hospital facilities would be sufficient, but this would not be a complete answer. As consonant with and in development of point number one of the fourteen point program for medical care, as applied to rural America, we also need the building of suitable habitations providing protection from cold and moisture and with proper plumbing, as many rural houses are not fit to live in; clothing;

appropriate for the protection of the individual; balanced diets suitable for the promotion of healthy growth in the young and maintenance of vigorous bodies in the mature, and a knowledge of better living habits, including instruction for expectant mothers, infant care and the home management of common ailments and first aid. All these add up to the need of widespread health education and appreciation which is the duty of the individual to learn if the presence of a physician in the community is to have full effect.

As the individual has his evident duties in this plan, so has the community through provision of qualified public health administration.

The value of all the foregoing may be included under the general term of health education. If the citizens have it, all is well; but if they do not have it or will not learn it the presence of the best trained physician is only partly effective.

Prepayment plans for medical care and for hospitalization have the approval of many farm groups; however, some of them feel that such plans should be consumer operated. Such plans should be made available to farm groups as early as experience permits.

The place of the marginal farmer in prepayment plans has been given much thought and discussion. He is presented as above the indigent but below the level of those able to join a prepay group.

He should be classed as medically indigent and cared for by taxation, but this term gives offense and must not be used, which all makes the situation very difficult.

This marginal farmer needs help, he wants help but he cannot pay for it. He refuses what he considers charity at the hands of the taxpayer but complains of hardship and inequity when he fails to receive care. It is difficult to know how this has been met in the past, but evidently some doctor has given the service, a kind of charity that has no sting to it for the recipient. The \$30 to \$50 premium may be too much for those with an annual income under \$1,000, though it would be interesting to know what is purchased with what they earn. It is possible that some plan for supplementing part payments with tax money could be devised.

A number of states, notably North Dakota, Virginia and Georgia, have sought through surveys of rural health needs to meet the long recognized problem of increasing shortage of professional personnel.

In Virginia a committee has been working on this subject since 1941. "They have advocated twenty set scholarships per year, in the two state supported medical schools to individuals who practice for a period of four years in rural areas." Pointing to the advantages of so-called health centers, the legislature is urged to appropriate \$360,000 to establish six such centers in communities for experimental purposes. (Letter from Dr. Mulholland.)

In North Dakota an extensive survey of medical, dental, hospital, ambulance, x-ray and public health facilities revealed a shortage of physicians in many rural areas. Three counties have no physicians and in many other parts a corresponding lack of hospital and public health facilities. The Farmers Union is sponsoring development of a cooperative health center which will employ physicians on a full time basis and members will receive complete medical and hospital coverage. Considerable experience may be gained from this and other efforts promoted by consumers of medical service. (Report of Dr. Larson.)

Georgia has published a "Public Health Program" for the state, prepared by the Health Panel of the Agricultural and Industrial Development Board. This is a most extensive and complete survey covering the period 1940-1944. It would seem to supply the information on which an immediate and long term plan can be based. This covers urban as well as rural needs. Since Georgia suffers from too few doctors not equitably distributed, the report sought to discover the reason. They concluded "First and most important is the lack of hospital, x-ray equipment and laboratories within easy distance of rural communities." Five types of service are proposed: health centers, shelter health centers, general hospitals, medical centers and tuberculosis hospitals. Health centers would house medical,

dental and public health personnel and be equipped with a small laboratory and fluoroscope, and shelter health centers, a larger unit located in county seats equipped as health centers and with the addition of an emergency and obstetric bed capacity equal to 1 or 1.5 beds per thousand, which, in addition to general hospitals strategically located, would give the doctor in rural areas the diagnostic aids he might have in more favored areas.

It is patently impossible to expect all communities to view their health needs with equal earnestness and foresight. It was recognized by the Farm Bureau as peculiarly their duty to educate their public in the desirability of health information and cooperation in health programs.

It would seem to be our privilege to set up the minimum elements within the framework of satisfactory rural practice. It is recognized that the social environment is an important factor, as is the opportunity to earn a satisfactory income. Assuming that these conditions are met, the rural practitioner should have available the diagnostic facilities and opportunity for consultation enjoyed by those near well equipped hospitals.

The construction by the people of a building wherein may be housed a clinical laboratory, x-ray, the full time public health office with adequate nursing staff, public health supervision, immunization, communicable disease control, control of food handlers, eating places, tourist and vacation camps, sewage disposal and other public health activities and where doctors' offices and dental offices might be housed would go far in placing the practice of medicine in rural communities on a satisfactory level.

This brief report of activity in a few states, pointing to the urgent need for some solution and sketching in general the outline of the conditions that should exist in rural areas for satisfactory professional activities, calls for a corresponding analysis of the plans, the hopes and the desires of the returning medical veteran. This is known only in part. Mention should be made of the valuable work of the Bureau of Information of the American Medical Association. Through cooperation with state societies, complete current information is compiled covering areas needing doctors. This covers "data relating to medical facilities, medical personnel and medical needs and other information concerning medical care within each state, together with the physical and economic aspects of any community in question." This information is made available to inquiring medical officers returning from service. The report cites since V-J day over 2,000 such inquiries. It is interesting to learn that a number prefer country to city locations. Unfortunately, the completeness of this record is hampered by failure of some state associations to cooperate. The integration of this information with the committees of the Farm Bureau and other rural groups should go far in placing doctors. The placing of physicians, however, cannot be considered as completing the job. Some way must be found to establish the facilities needed to keep them there.

In a recent letter Dr. Charles R. Bird, chairman, Procurement and Assignment Service for Indiana, states what may be true generally, that "of the 300 Indiana doctors released, comparatively few ease the situation in stringent areas. . . . Almost universally they inquire about towns of 20,000 to 50,000 population . . . and always demand a town with ample hospital and laboratory facilities. . . . Many of our small communities formerly with one, two or three doctors, now have none or, perhaps, one beyond the age of efficiency."

President Truman, in his recent message to Congress, stressed the inequity of distribution of doctors and of hospital and other health facilities to the great disadvantage of rural areas. He stressed, however, that those served must be able to pay for the service. Since there are places unable to meet this ability test, he proposed to create a pool of tax money on a national scale to assure the creation and maintenance of adequate facilities and supply the financial resources to give the professional personnel pay comparable to that to be had in other places. As he pointed out, these returning veterans cannot be assigned, they must be attracted to the places needing them. Under any plan proposed, several years will be required to build and equip the facilities now being contemplated.

It seems strange that this laudable purpose cannot be accomplished in some simple manner. The need exists now, not five years hence. The solution will not be easily found. It is hoped through a multitude of conferences within the several states, between the profession and farm groups, ways can be found to provide adequate medical care—some way free of the legal shackles which seem to distinguish most proposed legislative solutions.

Respectfully submitted,

F. S. CROCKETT, Chairman.

NEW BUSINESS

Resolution on Christmas Seal Drive of National Tuberculosis Association

Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, presented the following resolution, which was referred to the Reference Committee on Hygiene and Public Health:

WHEREAS, The National Tuberculosis Association has altered its policy and will not permit Christmas Seal funds to finance charitable cases in sanatoriums, a necessary practical relief measure to prevent contagion; and

WHEREAS, Under this new policy the National Tuberculosis Association insists that city and county welfare agencies place and treat all indigent patients, thus placing a greater load on taxpayers and often allowing infected persons to spread the disease because crowded welfare hospitals are unable to treat all patients; and

WHEREAS, This same policy also will not allow Christmas Seal Funds to finance children's camps, a time proved preventive measure to care for children of parents infected with active tuberculosis; and

WHEREAS, The National Tuberculosis Association places educational campaign work in importance over actual care and treatment of tuberculous persons; and

WHEREAS, This educational work, so called, consists in the distribution of literature and propaganda by lay paid social workers and promoters and other nonmedical work; and

WHEREAS, The National Tuberculosis Association exacts percentages ranging from a known 15 to 50 per cent from local community seal drives for nonmedical expenditures such as the aforementioned strictly propaganda campaigns and not for the isolation and actual prevention of tuberculosis; be it

Resolved, That the Board of Trustees of the American Medical Association confer with officers and trustees of the National Tuberculosis Association to determine why the aforementioned policies have been adopted and promulgated in the face of proved medical practice and determine further if the American Medical Association shall continue to support in letter and in spirit the Christmas Seal drive of the National Tuberculosis Association.

Resolutions on Future Medical Care of Veterans

Dr. James C. Sargent, Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Medical Care of Veterans:

WHEREAS, The record of a quarter century of government controlled medical care under the Veterans Administration serves as a shining example of the great difficulties inherent in any program of bureaucratic planning for the care of sick peoples; and

WHEREAS, The strong upswing in government inspired social planning, combined with the patriotic urge of all citizens to do well by those who sacrificed so much in the service of our country, presages a great wave of public and political sentiment toward the giving of free medical care to all ex-servicemen, their wives and families; and

WHEREAS, Activation of tens of thousands of reserve medical officers and the construction of large numbers of temporary army and navy hospitals under the recent war emergency has left a plethora of hastily assembled government medical facilities throughout the country ripe for exploitation by those who, through ignorance or design, would foist socialized medicine on a great block of American citizens by transfer of these facilities from their intended emergency war purposes to a permanent peacetime program of free sickness care for veterans and their families; and

WHEREAS, Any such sudden expansion of government controlled sickness care in America, however well it may be draped with the flag of patriotism, would still be nothing more nor less than one gigantic stride toward the ultimate complete socialization of all medical care in America; and

WHEREAS, The development of any such expansive program of sickness care for veterans and their dependents would cast a withering blight on American medicine that would be tragic for all, including the very veterans it proposed to help; be it therefore

Resolved, That this Association do everything in its power to urge and support the government in providing the best possible medical care for any veteran left disabled, through injury or disease occurring in, this or any other war; but be it further

Resolved, That it reaffirm its long established opposition to any attempt at the socialization of medicine in America by extending medical benefits under the Veterans Administration to encompass disabilities that obviously are not service connected or to the general medical care of the dependents of veterans.

Resolutions on Licensure of Honorably Discharged Medical Officers Without Examination

Dr. James C. Sargent, Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, A large number of recent medical school graduates have been called to active duty in the armed forces without opportunity to submit to examination for license to practice medicine in the states in which they are to locate; and

WHEREAS, Other older physicians, after abandoning their established homes and practices to serve their country, now find it necessary or desirable to relocate in some states other than the ones in which they had been practicing; and

WHEREAS, An obvious injustice will be done if physicians, as they approach the end of their long years of patriotic sacrifice, are required to hold all personal plans in abeyance until opportunity for examination presents and in the end submit to the risk of a highly technical examination the result of which is beyond appeal; be it

Resolved, That this Association hereby record its belief that any physician who has graduated at an approved medical school with the degree of Doctor of Medicine and who has served honorably as a medical officer in the United States Army, Navy or Public Health Service during the recent war has, by the requirements of his commission and his good record of service, furnished proof above any reasonable question that he is ethically and professionally qualified for license in any state or federal district in the Union; and be it further

Resolved, That a proper memorial to this effect be forwarded to the governor and to the board of medical examiners of each state urging each to license, without examination, any applicant who has been granted the degree of Doctor of Medicine by an approved medical school in the United States and who has served honorably in the United States Army, Navy or Public Health Service.

Resolutions on Creation of Committee on Medical Preparedness

Dr. James C. Sargent, Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Postwar Planning:

WHEREAS, In times of war the enormously expanding armed forces of our country always find it necessary to draw on the medical profession for a great number of volunteers from among the physicians in private practice; and

WHEREAS, Recent wars have caught the country and the profession without a well developed plan for the procurement of this large number of volunteer medical officers; and

WHEREAS, This lack of careful advance planning has led to a disruption of civilian medical care to the point, even, of the risk of great national disaster in the event of large civilian casualties of widespread epidemic; and

WHEREAS, The system of peacetime enlistment of reserve medical officers augmented in wartime by Procurement and Assignment under the War Manpower Commission, while succeeding nobly in its primary purpose, failed notably in accomplishing fair and even spread of military duty throughout the profession as a whole; and

WHEREAS, The evident lack of full use of the professional talents of many medical officers in the services raises serious question regarding the true number of physicians actually needed by the military services in time of war; and

WHEREAS, A heavy dual responsibility rests on the medical profession to inspire and lend its informed opinion to the development of a program that will insure, in the event of future war, a prompt and proper supply of physicians to the armed forces and, at the same time, insure adequate civilian medical care at home; and

WHEREAS, The American Medical Association in exercising, as agent for the profession, its powerful control over the lives and fortunes of the individual doctors of America is, by that very token, charged with the great responsibility of doing all in its power to see that physicians will not be pressured into the armed services in time of war beyond the numbers actually needed, that those who volunteer will be utilized for their medical talents only and that they will be required to serve for a reasonable and well defined period at the end of which they may be released to civilian life and replaced by others from among their colleagues; be it for these several closely related reasons

Resolved, That in the interest of the general public health of our country this Association undertake a thorough study of the proper apportionment of physicians to military and civilian needs in time of war; and be it further

Resolved, That in the common interest of all within the profession this Association undertake a review of past experiences in the procure-

ment and assignment of practicing physicians to the armed forces in an effort to devise some workable program whereby the privilege and responsibility of military duty in future wars may be divided more evenly throughout the profession; and be it further

Resolved That in the interest of preserving the professional talents of those physicians serving in the armed forces in time of war this Association undertake a critical study of the duties of medical officers during the war just past with special reference to (1) opportunities for study, research and actual treatment of the sick, (2) rotation of medical assignments, (3) quasimilitary duties for which technicians and specially trained enlisted personnel might replace physicians, (4) nonmedical duties for which the special talents of physicians are not required and (5) periods of total inactivity as pooled personnel, in unit training areas, in staging areas, awaiting separation; and be it finally

Resolved, That, to implement these closely related studies, the Board of Trustees be and hereby is requested to allot necessary funds and appoint a special Medical Preparedness Committee to study, by means of questionnaires sent to medical officers on release from active duty, by conferences with proper military authorities and by other means the problem as herewith outlined, said committee to report its progress at each future meeting of this House of Delegates until such time as its final report, together with recommendations that it may find indicated, has been submitted and the committee discharged

Resolution on Activities of Employees of American Medical Association

Dr. S. J. McClendon, California, presented the following resolution, which was referred to the Reference Committee on Executive Session:

WHEREAS At this time many important problems confront the medical profession; and

WHEREAS, The American Medical Association is in need of the most efficient organization possible in the solution of its problems; and

WHEREAS, Employees who participate in activities outside of the Association cannot render their best service to the Association, therefore, be it

Resolved, That all employees of the Association who are not specifically employed on a part time basis shall be required to devote their full time to the activities of the Association for which they are employed and shall not engage in outside activities from which they derive financial income

Resolutions on Proposed International Congress on Tropical Medicine

Dr. Thomas K. Lewis, New Jersey, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The exigencies of recent years have intensified research on problems in the field of tropical medicine, resulting in numerous and significant discoveries which materially contributed to the success of our military operations in foreign theaters; and

WHEREAS, Since the general interest in tropical medicine is more widespread than at any time in the past and the medical profession is keenly aware of these problems which become more pressing because of the phenomenal growth of international air travel; and

WHEREAS, It is important that information on these discoveries be brought to the world in order that with the return of peace the benefits of this knowledge may be available to promote the well being of the people of the world; and

WHEREAS An international reunion of those who have contributed to these advances with others who may be qualified to disseminate their benefits is the most effective measure to diffuse generally this knowledge and since such an international gathering of scientists will materially contribute to the better international understanding and cooperation so essential to an enduring peace; be it

Resolved That the American Medical Association heartily endorse the proposal of the American Academy of Tropical Medicine that an International Congress on Tropical Medicine and Malaria be held in the United States at an early date and that the American Medical Association join with the American Academy of Tropical Medicine in petitioning the State Department of the United States government officially to sponsor and invite international participation in such a gathering at as early a date as is regarded opportune and direct the secretary of the American Medical Association to advise formally the State Department of this endorsement; and be it further

Resolved, That the Board of Trustees of the American Medical Association be authorized and empowered to appoint a member of the American Medical Association to represent the American Medical Association on a committee composed of duly authorized and appointed representatives of the American Academy of Tropical Medicine, American Society of Tropical Medicine, National Malaria Society, American Society of Parasitologists, Southern Medical Association, American College of Physicians, American Association for the Advancement of Science and the Section on Medical Science of the National Research Council to meet on call from the president of the American Academy of Tropical Medicine for organization and in their organized capacity to assist the State Department in developing, promoting and holding such a congress, and the American Medical Association will give all practicable support to the realization of this project.

Principles Dealing with Medical Care for Veterans Adopted by Medical Society of New Jersey

Dr. Thomas K. Lewis, New Jersey, presented the following statement including a copy of the Monmouth County Plan for Veterans' Medical Service, which was referred to the Reference Committee on Medical Care of Veterans:

The Medical Society of New Jersey is of the opinion that organized medicine should concern itself actively with and should assume a large measure of responsibility for the medical care of the returned wounded and physically unfit veterans of our armed forces. It is of the opinion that detailed plans for such care should be established at a community level.

Based on a study of the Monmouth County plan, which has been established and approved through direct contact with General Hawley, the Medical Society of New Jersey has adopted a set of principles sufficiently broad in scope to provide the framework for the adequate care of veterans in any community.

The Medical Society of New Jersey submits the following principles in the hope that they may be helpful in the production of a formula by the House of Delegates of the American Medical Association to serve as a foundation for county or community organization on a national basis: 1. That there shall be established by each county medical society a liaison committee to serve in close cooperation with the local or regional representative of the Veterans Administration with the following duties: (a) to provide screening or diagnostic teams or clinics in well equipped general hospitals or other suitable locations for the purpose of establishing the medical needs of the veteran and directing him to that physician or institution where he may be most adequately treated, (b) to utilize to the fullest extent the mechanics of the private practice of medicine, (c) to establish fees for service rendered at average reasonable rates existent in the particular community, (d) to utilize in those cases requiring hospitalization the approved general hospitals and specialty hospitals in the immediate locality, except where state, county or Veterans Administration hospitals are indicated as most suitable for the particular condition involved, (e) to obtain, through close cooperation with the local representative of the Veterans Administration, the greatest possible simplicity of forms for obtaining authorization for rendering reports and bills and (f) to serve as an appeal board to determine adequacy of medical service and to be endowed with disciplinary power over physicians for the purpose of protecting the interests of the veteran and the Veterans Administration; 2. that existing general hospitals be used to the fullest possible extent in each community with enlargement where necessary by federal grants, as the indiscriminate erection of new institutions by the Veterans Administration or the federal government would be wasteful and in most cases would remove the veteran far from his home, and it is our studied opinion that new institutions should be erected only where need for special types of cases might require long and continued hospitalization or for large groups requiring unique or unusual type of medical care and the need for such institutions should be clearly demonstrated before establishment; 3. that the eligibility of a veteran for care at government expense should be limited to veterans who (a) have service connected disability or (b) who are in need economically.

It is maintained that any veteran not suffering from service connected disability and not in acute economic want should obtain his medical care in the same manner as any self-sustaining citizen.

THE MONMOUTH COUNTY PLAN FOR VETERANS' MEDICAL SERVICE

The purposes of the Monmouth County plan are to provide individual doctor-patient relationship, a free choice of physician as far as is compatible with good medical practice, the elimination of the psychologically bad situation of treatment by a "government doctor" in whose selection the patient has had no part and the avoidance of the necessity of traveling long distances to a veterans' facility by providing medical and hospital care within a reasonable distance of the veteran's home.

The plan, as authorized by Major Gen. Paul R. Hawley, Acting Surgeon General of the Veterans Administration, is as follows:

1. All members of the Monmouth County Medical Society and of other county medical societies in New Jersey who are designated by the Monmouth County Medical Society will, with their consent, be designated as part time physicians of the Veterans Administration.

2. The Monmouth County Medical Society will establish in such hospitals as it may determine triage or sorting clinics. Such clinics will be open for the examination of veteran patients at such times as the need indicates, probably once each week or more often. Each such clinic will be staffed by such specialists as are indicated after a trial. The function of these clinics is (a) to determine by examination whether or not the veteran needs treatment, (b) to determine what such treatment should be and where it should be given and (c) in cases in which treatment is authorized by the Veterans Administration to refer the patient to the proper physician or hospital for such treatment.

3. The Monmouth County Medical Society will form a disciplinary or reference committee to see that the patient receives the treatment indicated by the designated physician and to pass on complaints from all sources.

4. The Monmouth County Medical Society will operate this program for a trial period not to exceed three months without pay, except that physicians giving treatment authorized by the Veterans Administration will be paid fees. The Monmouth County Medical Society will submit to the Veterans Administration a schedule of fees which its members believe to be reasonable and just, and the Veterans Administration, after consultation with the society, if necessary, will determine the schedule of fees to be paid. Except for the payment of authorized service to patients, the Veterans Administration will not be obligated financially during this trial period.

5. The Veterans Administration will provide the proper liaison and facilities for making prompt decisions as to service connection in each of the clinics.

It is also anticipated that the foregoing program will be correlated with the Veterans Administration plans to use local hospital facilities, both general and specialized. The veteran hospitalized in a general hospital would be treated by a designated physician who is also a member of the staff of that hospital. Other arrangements will have to be made regarding specialized hospitals, such as nervous and mental, having full time closed staffs.

It should be noted that in the foregoing plan every effort is being made to utilize the services of ex-veteran physicians, both as designated physicians and as members of the clinic staff. The proposal to have the clinic staff made up of specialists follows the previous practice of the Veterans Administration, and it is felt to be the quickest and most efficient way of arriving at exact diagnosis. Treatment will be put in the hands of the general practitioner whenever possible.

Resolutions on Permanent Conference on Medical Care

Dr. Thomas K. Lewis, New Jersey, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, It has long been the objective of organized medicine in America that satisfactory distribution of the best possible quality and quantity of medical care shall be available, physically and economically, to all the people of the United States and in all parts of the United States; and

WHEREAS, The government of the United States is now officially committed to the attainment of the same objective; and

WHEREAS, The realization of such an objective can be most effectively accomplished through wholehearted participation by the medical profession and through the satisfactory integration of any plan with the mechanics of the practice of medicine as developed in this country through the experience of one hundred and seventy years incidental to the evolution of the American way of life; therefore be it

Resolved, That this House of Delegates instigate the formation of a Permanent Conference on Medical Care to be created immediately either by (1) the American Medical Association, (2) the Congress of the United States or (3) the President of the United States, to be composed of an equal number of official representatives of (1) the American

Medical Association and (2) the governmental agencies concerned with health services and that the members of such conference be given equal powers of action to the end that the American people may be provided in our time with the best possible quality, quantity, availability and distribution of medical care by concerted American democratic action with resultant peaceful solution of the medical care problems which concern us all, and further be it

Resolved, That the representatives of the American Medical Association to this conference be appointed by the Speaker of this House of Delegates

Resolution on Recognition of Physicians Who Served on Procurement and Assignment Service in Various States

Dr. William D. Stovall, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Postwar Planning:

WHEREAS, The need of the military for physicians during the war period was acute and required large numbers of them; and

WHEREAS, The selection of these physicians was delegated to the Procurement and Assignment Service in the various states; and

WHEREAS, This service rendered loyal, energetic and effective effort in the selection of those men who were to be made available to the military service at the least possible hazard to the civil population; therefore be it

Resolved, That the House of Delegates authorize the recognition of this devoted and unselfish service by awarding an appropriate symbol to the medical personnel of the Procurement and Assignment Service of the nation and the various states which will be an expression of the appreciation of the medical profession of the nation

Resolution on Early Return of Physicians and Medical Students Now in Military Service

Dr. William D. Stovall, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, It is acknowledged that our national medical resources have been such as to provide the armed forces with the finest medical service available in the world; and

WHEREAS, Despite the efforts to utilize the supply of medical personnel to the best advantage there existed to a considerable extent ineffective distribution and poor utilization of medical personnel within the armed services; and

WHEREAS, The medical resources of the country are impoverished for civilian usage and this condition has been accentuated with full effects only to be felt in the future by the refusal of Selective Service to defer prospective medical students; and

WHEREAS, There exists under the control of military officials a large pool of medical students and prospective medical students who, in the interest of the health of the nation, should be released to the pursuit of their chosen profession; now therefore be it

Resolved, That the State Medical Society of Wisconsin, through its House of Delegates in annual session in Milwaukee in October 1945, urges its officers and official representatives to initiate or support such programs as may be desirable to assure not only the early return of medical veterans to civilian practice but the return of medical school students and prospective medical school students to additional training

Resolutions on Appointment of Committee for the Study of Nursing Problems and Education

Dr. William D. Stovall, Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

WHEREAS, The medical profession of Wisconsin has over a period of several years interested itself vitally in the problem of nursing education and classification and functional utility and believes there is a definite need of reevaluation and alignment with contemporary economic, social and public health need; and

WHEREAS, There is formulating a movement on the part of nursing educators and leaders to restudy the problem of nursing education and functional level of practice in the light of prewar, war experience, social need and public health expediency; and

WHEREAS, The problem is so definitely one of multiple jurisdictional interest and responsibility in which the medical profession as well as hospital management have a major part and obligation to the public to use the weight of their experience and authority in assisting to bring about the most perfect program possible in the nursing field; and

WHEREAS, It is necessary in the interest of reciprocal arrangements for interstate movement and practice of nurses to reach the national level of influence; therefore be it

Resolved, That the American Medical Association emphasize the need for the constituent state associations to interest themselves in this problem and to bring about a truly national picture and analysis of the problem; and be it further

Resolved, That a committee for the study of nursing problems and education to act as a unit of a joint committee composed of hospital and nursing personnel, each to be appointed by their respective national organizations, be appointed by the President of the American Medical Association and that the American Medical Association request these respective national organizations to appoint similar committees

Introduction of Major General Paul R. Hawley

The Speaker announced the presence of an honored guest, Major General Paul R. Hawley, and requested Dr. Fred W. Rankin, Past President, to escort him to the platform.

Address by Major General Paul R. Hawley

The Speaker introduced Major Gen. Paul R. Hawley, acting surgeon general of the Veterans Administration, who addressed the House as follows:

Mr. Speaker and Officers of the American Medical Association, Members of the House of Delegates: I consider it a high privilege to be permitted to appear before you. You are the representatives of the best in American medicine. I want to report to you as one medical man to another what we propose to do in the medical care of the veterans. There have been several things said here today that I should like briefly to comment on before I plunge into my subject.

I know of no better place than this to pay the greatest possible tribute I can to the sixteen thousand American doctors who served our forces in the European Theater of Operations. The great majority of these—and certainly all of those in the key positions—were members of this Association. I was impressed this morning by a statement made from this platform—mention of the great work done by American medical colleges in the past twenty-five years. I heartily endorse this statement. I have been asked frequently what was the greatest advance in medicine between World War I and World War II which had accounted for the great reduction in the case fatality rate among the wounded in World War II.

I was expected to say plasma or whole blood, sulfonamides, penicillin. I know that these certainly played a great part; but, from very close association with the wounded, I am quite sure in my own mind that the greatest advance between the two world wars was the better education of doctors. There is no substitute for a good doctor.

I should like also briefly to comment on a resolution which was offered here on the inclusion of osteopaths in H. R. 4717. I objected strenuously before the subcommittee rewriting this bill when that proposal was made; and General Bradley, in his official report on the bill, also objected to that provision.

Now I come this afternoon to present for your consideration the greatest single problem that has ever faced American medicine, and perhaps one of the greatest problems ever in the history of medicine. This is to give a very high standard of medical care to approximately twenty million men.

The medical care of the veteran was attempted, after the last war, largely by a full time corps of doctors. There were only four million veterans at that time, and I think that, no matter what misstatements may have been made of the medical service of the Veterans Administration, it is at least a safe statement to say that that standard of medical care was never quite high enough to satisfy the medical profession, the veteran or the people of the country.

I think we should inquire into the reasons why it was not a complete success. One reason was that this full time corps was organized hurriedly. There was no nucleus around which to organize, and doctors were procured often without too much attention to their qualifications. The Army, I know in my experience, obtained a great many new doctors after the last war; and, with an old organization behind them, with every facility for making determinations of qualifications, there were mistakes made. So it is not surprising that mistakes were made by the Veterans Administration.

Then, when this corps was organized, the medical service was submerged under lay administrators—both in the central office in Washington and in the field. These administrators not only knew nothing of medicine but too frequently were not very much interested in the problems of medicine. Then, in the procurement of new doctors, the Civil Service dictated the selection. They also prevented the removal of the poor material that did get in.

The doctors in the Veterans Administration were isolated from the rest of the profession and from the advances in medicine.

This Association, for sound reasons of its own, made it almost impossible for a doctor in the Veterans Administration to become a member, and they began to feel that they were outcasts and pariahs in the profession. I have been repeatedly urged to petition you—and a resolution from another source has been placed before you today—to grant membership in the American Medical Association to the doctors in the Veterans Administration. I should like very much to see this done; but I shall not ask you for this until the medical service of the Veterans Administration is reorganized, as it is wisely stated in the resolution, and meets the standard which you want it to meet. I feel quite confident that, when I come before you at that time, you will generously extend the privileges of this Association to the doctors in the Veterans Administration.

It has been charged that, on the whole, the doctors in the Veterans Administration were discouraged and merely drifting along; that they went to work at 8:30 in the morning and quit at 4:30 in the afternoon; that they were holding jobs rather than practicing medicine. I think it is true that there have been, and perhaps still are, some of that type in the Veterans Administration, because it is from that type that I am now getting the most opposition to the reorganization of this medical service. But, gentlemen, I would be very unfair to many fine doctors in the Veterans Administration if I did not assure you that one of the most encouraging things that I have found since coming to the Veterans Administration is that there are some very high class doctors in the Veterans Administration—doctors who have refused to give way to discouragement, refused to admit defeat in a defeated organization. A goodly number of these doctors have qualified themselves by their own efforts, working at night and without any encouragement from above, to qualify for their boards. And what a struggle they must have had!

We have some fine hospitals. We have some fine clinics. Only recently a surgical clinic was held in one of our hospitals. I was unable to attend and I sent Elliott Cutler and Glenn Spurling, both of whom are known to you. They both were enthusiastic about what they saw. Cutler wrote to me "I would have been proud to have had that clinic given on my service at the Brigham." So there are good doctors in the Veterans Administration. The only trouble is there aren't enough of them. We have got to get more.

If we failed to take care of only four million veterans satisfactorily with a full time corps, it seems to me that it would be folly even to approach the problem of attempting to take care of twenty million veterans with a full time corps. However, we must have some full time doctors in the Veterans Administration. There must be continuity in our hospitals that can never be had with part time people. There are other positions requiring some administrative as well as medical background that can be filled only by full time physicians. So we must have some full time physicians, but we can't in any way solve the problem with such a corps. The problem can be solved only by the organized medical profession of this country, and I repeat the word "organized." That is the profession, the organization, that you represent.

The only question is, How shall it be solved? Well, at present we have about 72,000 beds in operation in veterans' hospitals with 11,000 emergency beds, so called, crowded into the halls, totaling about 83,000. To operate these beds and fill the medical positions in the regional office we need about 3,600 doctors at the moment, and the need is increasing every day. We have 2,300, so we are short 33 per cent of the doctors that we now need full time. Of these 2,300, 1,700 are in uniform. A great many of those in uniform are doctors who were formerly with the Veterans Administration and who might be expected, if they were invited, to stay with the Veterans Administration after they have been separated from the service. But a recent canvass of all those 1,700, regardless of where they came from or what they were doing before the war, showed that only 35 per cent would elect to stay with the Veterans Administration after the war.

Now that means that unless we get new blood and get it fast, by the spring of 1946 we are going to have only one third as many doctors as we require at the present time to carry our load, and our load is increasing daily. So obviously we have

got to have help in the medical care of the veteran from the organized profession of this country. That situation is very plain to me; yet in face of this plain situation there is heavy pressure from several sources to force us to take over every existing army and navy hospital built during the war and to try to operate them—I say “try to operate them”—for the veterans. Most of these hospitals were built in isolated places, having been located the same way in which some effort is now being made to locate new veterans’ hospitals—by political expediency. Such are usually out in the country where it is impossible to get any part time help to staff them.

You may ask me now that, since we can’t staff the hospitals that we already have, why do we even think about building more hospitals? Well, we have got to have more beds if we carry out the program of the Congress for the veteran. We would use beds in existing hospitals if we could get them; but there are few places in this country where there are any beds available, and no one knows that better than this group right here. We make every effort to put beds under contract wherever we can get them, but we are not very successful. On the other hand, as you know, as the law now stands we are not permitted to pay for beds in hospitals for non-service connected cases, and the policy has been announced both by the President and by the Congress that we shall provide some beds for non-service connected cases.

So, if we are building new beds now, how do we propose to staff them? If you will see where the great majority of these new beds are being located, you will understand that we propose to staff them almost exclusively by physicians in the private practice of medicine. To solve this particular problem of associating our hospitals with the schools of medicine and with other hospitals of the country—not only the schools of medicine, because we are also going into towns that have a fine medical profession without having a medical school—I have been most fortunate in obtaining the services of Dr. Paul B. Magnuson. He has given up his practice and has come full time because he sees, in this great need, an opportunity not only to serve the veteran but also to serve the medical profession. He has asked to advise him Dr. Bennett of Baltimore and Drs. Pepper and Rodman of Philadelphia, and Dr. Darrach of New York—men that he could easily get to, that lived close to Washington. I offer to you the names of these gentlemen as a guaranty that what we propose to do in the care of the veteran will not only be in the great interest of the veteran but also will be in the interest of the profession. Not one man that I have mentioned here but has your greatest confidence.

We hope to get younger physicians returning from the service, qualified men who have passed their boards, men who have come back without financial resources with which to start practice, having spent most of their money before going into the Army in getting their qualifications. They are coming back now, having to start in practice without much to start with. We think we can help this group of fine young specialists by having them take over services part time in such of our hospitals as are located convenient to medical centers. I need only to say that from such men there will be found attending staffs in every sense of the word, with full responsibility for the patients, and you gentlemen know what an attending staff is and what is required of it. Then we shall provide residencies in these hospitals—also for returning servicemen whose education has been interrupted or who have not even started their qualifications for a board. We have that system now in operation in one hospital. It is being started in another, and a third has been surveyed. This program will be extended as rapidly as it is humanly possible to get around to our hospitals. There has been objection in certain quarters from a misconception of our proposals. It is a curious thing that there has been opposition for many years, from certain groups, to teaching in veterans’ hospitals. These people hold the curious idea that, when you teach in a hospital, patients necessarily are guinea pigs. Obviously, a veteran is never going to be a guinea pig. The veteran is a private patient. The only difference between the veteran and the wealthiest patient in the best hospital in this country is that the government is paying the veteran’s bill.

So much for the hospitalization of the veteran. An even larger problem is his outpatient care and treatment. Here we run into a legal obstacle which causes considerable administrative difficulty. This is that the veteran is entitled to outpatient treatment at government expense only for a service connected disability; and so the service connection of his disability must first be established before the treatment can be authorized by the Veterans Administration.

Now, after World War I this sort of thing was attempted by contracts with individual physicians throughout the country. Too many of these designated physicians were political appointees. Busy physicians usually shied away from these appointments. While the great majority of the designated physicians were scrupulously honest, there were scandals. There was collusion with patients, and fees sometimes were split with patients for unnecessary treatment. We cannot now afford, as a Veterans Administration or as a profession of medicine, to have any scandal in our outpatient treatment of the veteran. We want no small group of designated physicians for veterans. We want every veteran to have the free choice of his physician; and how can he have it? He can have a free choice only if every qualified and ethical physician accepts appointment by the Veterans Administration.

The Veterans Administration can’t deal, obviously, with 125,000 individual physicians in this country. That would be a physical impossibility. We must deal with organizations of physicians. Now, how shall we deal with organized medicine? On our terms or on the terms of organized medicine? Well, it seems to me, since organized medicine is going to have to do most of this work, that we in turn shall have to deal with you largely on your own terms. I hasten to say that we have already found organized medicine most fair and reasonable in the scales of fees which have been submitted to us. The profession has shown every intention of doing its full part in the solution of this problem. We rather think that no nationwide plan can succeed because the situation in the medical profession and the distribution of veterans vary widely in different parts of the country.

On the other hand, we rather shudder to think of having to deal with the three thousand county medical societies in this country. We have two plans under way now with state organizations, and these promise to be very successful even though one of the states is highly urban in certain parts and highly rural in others. We thought that perhaps this would be a factor we would have to consider in every state—the difference between the rural and urban sections of the state—but we are assured by both of these state organizations that this isn’t important, and that they can have one single scale of fees throughout the state.

Our only stipulations in any plan are that the veteran receive adequate treatment—as much as he needs and no more than he needs—and that organized medicine itself set up the necessary control of this medical service—the policing of it, if you will—to insure that the veteran gets such care and that neither the veteran, the doctor or the government is in any way defrauded. We have just started to organize this outpatient service. First came to us those public spirited physicians in Monmouth County, N. J. They first came last May with a plan that was rejected for reasons that we have never discovered. As soon as we heard of that plan we telephoned the Monmouth County Society and asked if they were still interested. They were interested and their plan is in operation.

We now have a Michigan plan, where they have a medical service in the state, and also a Kansas plan. These two plans are interesting in that they vary in this one essential, and in only one essential. From the Michigan Medical Service we buy medical service to the veteran; and we pay the Michigan Medical Service for it. Dr. Callahan, the president of the Kansas Medical Society, for reasons perfectly good to that society, didn’t want it to participate in any of the financial arrangements between the Veterans Administration and the individual doctors. This was quite agreeable to us. The state society was to act only as an agent for the individual doctors of the state. In both plans we are to set up an administrative office in connection with the state agency, whether it is a prepayment medical service or a state association, taking away from

them, as much as possible, the administrative work connected with service to the veterans, and to provide an agency which can immediately determine service connection and authorize outpatient treatment.

We should like to deal with every other state in the Union. We are so limited in staff that it is difficult for us to get around and interview you; but we have immediately seized on every proposal that has been made and have worked out agreements that were mutually satisfactory.

In conclusion, I want to assure you that, even though I have spent thirty years in a highly organized government service of medicine, I should deeply regret a government control of the medical profession. I have a great respect for the profession of medicine. I was brought up in an atmosphere of medicine. I have a respect for the dignity of the profession. My grandfather was a physician. My father was a physician. I have respect for organized medicine. My grandfather and my father and myself were at one time paying members of this Association. They kept on paying until they died; but, by the courtesy of this great Association, when I put on a uniform as a career I was made a Fellow, which I have been for many years. Before I joined the Army I too was a member of my county medical society down in Indiana and my state medical society and the American Medical Association. So organized medicine is nothing new to me.

The people in this country have not lost any respect for the physicians of this country. It has been stated today on this platform that there is some doubt as to whether or not the people of the country have lost confidence in the organization of medicine. Whether this is true or not, it is something to be considered.

How better can we establish this great organized profession in the esteem of the people of this country than for us together to attack this great public problem and show our people that a free and unregimented and ungoverned profession can solve the problem and that it is not necessary for the government to tell the medical profession how to run its business? I am just as much interested as you are in keeping the government out of the medical business. I am committed to only one principle, that the veteran shall receive the best in American medicine. I can't support any program which denies him the best in American medicine, and I am quite sure it will be a long time before we find the best in American medicine, in any quantity at least, in other than the civil practice of medicine.

If I am not permitted to bring the best in American medicine to the veteran, I shall withdraw at once from the program. I shall neither let down the veteran nor betray our own great profession.

The Speaker, with permission of the House and General Hawley, referred the address to the Reference Committee on Medical Care of Veterans for a report.

Resolution on Survey of Medical Societies in Metropolitan Centers Re Qualifications of Their Physicians

Dr. C. B. Conklin, District of Columbia, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The charge is frequently made that in metropolitan centers of the United States there is no reliable source of information with respect to the qualifications of physicians, especially if they are engaged in specialties; and

WHEREAS, In the opinion of the Medical Society of the District of Columbia it is desirable for medical societies to make available to the public such information about physicians; and

WHEREAS, The Medical Society of the District of Columbia has classified its members according to type of practice, setting up qualifications for listing in the specialties and in so doing has rendered a public service; and

WHEREAS, The public has taken full advantage of an information center established by the Medical Society of the District of Columbia, calls for information having steadily increased and commendations having been received from business establishments, the government and other institutions and organizations; therefore be it

Resolved, That the House of Delegates of the American Medical Association instruct the Secretary of the Association to make a survey of the medical societies in the metropolitan centers of the United States to ascertain to what degree they have made information with respect to the qualifications of their physicians available to the public and, where this has not been done, recommend that such classification be undertaken.

Resolution on Development of Specific National Health Program

Dr. C. B. Conklin, District of Columbia, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The Medical Society of the District of Columbia has long favored the adoption of a constructive program by the American Medical Association where social and economic issues relating to medicine are concerned; and

WHEREAS, In recent months there have been encouraging signs of positive action by the Association's Council on Medical Service and Public Relations; and

WHEREAS, In the opinion of the Medical Society of the District of Columbia efforts should be continued to project a program which will receive wide public support; be it therefore

Resolved, That the House of Delegates of the American Medical Association instruct its Council on Medical Service and Public Relations to proceed as promptly as possible with the development of a specific national health program, with emphasis on the nationwide organization of locally administered prepayment medical plans sponsored by medical societies to be submitted to the House at its meeting in 1946 for its consideration.

Resolutions on Use of Sulfonamides

Dr. C. W. Lane, Section on Dermatology and Syphilology, presented the following resolutions adopted by the section at its 1944 session, which were referred to the Reference Committee on Miscellaneous Business.

Dr. Howard Fox and Dr. Marion B. Sulzberger presented the following resolutions, which were passed by the section:

WHEREAS, Local and general sensitization to sulfonamides sometimes of a serious nature are being reported with increasing frequency following topical applications in relatively minor diseases; and

WHEREAS, The local use of these drugs may prevent their subsequent administration in illnesses of a serious nature; be it

Resolved, That the Section on Dermatology and Syphilology condemn the present indiscriminate local use of sulfonamides in diseases in which other ordinarily less harmful remedies are equally efficacious; and be it further

Resolved, That a copy of this resolution be sent to the Food and Drug Administration of the federal government.

Resolutions on Minimum Wage Standard

Dr. F. W. Winslow, New York, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The House of Delegates of the Medical Society of the State of New York agrees fully with the sentiments expressed by Dr. Edward R. Cunniffe, president of the society, regarding the advisability of organized medicine showing its attitude on matters concerning the economic welfare of the public; therefore be it

Resolved, That the House of Delegates go on record as favoring a minimum wage standard sufficiently high to permit the worker to be and to remain an independent individual able to pay his or her way in the purchase of the necessities of life; and be it further

Resolved, That the House of Delegates of the American Medical Association be urged to adopt a similar resolution; and be it further

Resolved, That the House of Delegates of the American Medical Association be urged to adopt a similar resolution; and be it further

Resolution on Change in System of Medical Care

Dr. T. K. Gruber Michigan, presented, without reading, a Resolution on Change in System of Medical Care, which was referred to the Reference Committee on Legislation and Public Relations.

Resolutions on Transfer of Children's Bureau

Dr. O. W. H. Mitchell, New York, presented the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health:

WHEREAS, The U. S. Public Health Service is the official agency of the federal government primarily responsible for the prevention of disease and the protection of the public health; and

WHEREAS, The U. S. Public Health Service carries on these activities through the state departments of health and other state agencies in the field of public health; and

WHEREAS, The health services for mothers and children now conducted by the Children's Bureau of the Department of Labor parallel and in many instances overlap the responsibilities of the Public Health Service and require duplication of district facilities and personnel and a confusing duplication of federal relationship with state health departments and other state agencies in the field of public health; and

WHEREAS, It would be more logical, more effective and more economical to have all public health responsibilities concentrated in one federal agency and establish one direct channel of relationship with state health departments; therefore be it

Resolved, That the House of Delegates of the Medical Society of the State of New York hereby memorializes the House of Delegates of

the American Medical Association to petition the Congress and the President of the United States to transfer the personnel, facilities and budget of the Health Services of the Children's Bureau from the Department of Labor to the U. S. Public Health Service; and be it further

Resolved, That the House of Delegates of the American Medical Association directs that a petition be sent by the proper officers to the Congress and the President of the United States urging this transfer of the personnel, facilities and budget of the Health Services of the Children's Bureau from the Department of Labor to the U. S. Public Health Service.

Resolution on Opposition to H. R. 2969

Dr. E. M. Gans, Montana, presented, without reading a Resolution on Opposition to H. R. 2969, which was referred to the Reference Committee on Legislation and Public Relations.

Resolutions on Opposition to H. R. 525 and S. 1271

Dr. Stanley H. Osborn, Section on Preventive and Industrial Medicine and Public Health, presented the following resolutions, which were referred to the Reference Committee on Industrial Health:

WHEREAS, There has been introduced into Congress two bills, H. R. 525 and S. 1271, which propose an extension of the activities of the Department of Labor to undertake industrial hygiene activities; and

WHEREAS, These bills empower the Secretary of Labor to make grants of money to state agencies administering labor laws to undertake industrial hygiene work; and

WHEREAS, Industrial hygiene is a function of public health authorities and is now being done by the United States Public Health Service and by the health departments of forty states; and

WHEREAS, Money for industrial hygiene purposes is already allocated by the United States Public Health Service to state departments of health through Sec. 314, Public Law 410, 78th Congress; and

WHEREAS, The undertaking of industrial hygiene activities by the Federal Department of Labor and state agencies administering labor laws, already being done by the United States Public Health Service and state departments of health would result in confusion and waste of public funds; therefore be it

Resolved, That the House of Delegates of the American Medical Association go on record as opposed to H. R. 525 and S. 1271 in their present form, which permit labor agencies to undertake industrial hygiene activities now being done by federal and state public health agencies; and be it further

Resolved, That any expansion of tax supported industrial hygiene services be developed in a manner to provide immediate or ultimate responsibility for direction of the program by the state departments of health in cooperation with the United States Public Health Service.

Resolutions on Earliest Possible Release of Physicians from Military Service

Dr. C. R. Keyport, Michigan, presented the following resolutions, which were referred to the Reference Committee on Postwar Planning:

WHEREAS, With the cessation of hostilities the need for medical officers in the armed forces is greatly reduced; and

WHEREAS, The President of the United States has announced that the number of civilian physicians was reduced by some 60,000 who volunteered for military service and was further reduced by more than 20,000 deaths among civilian physicians; and

WHEREAS, During the period of the war, replacement of physicians in civilian practice has been practically nil; and

WHEREAS, There is an urgent need for the return to civilian practice of many thousands of physicians now in the armed forces; therefore be it

Resolved, That the American Medical Association strongly urge that every physician in the armed forces who can possibly be spared and whose duties are not essential to the health and care of our own military personnel be released from service with least practicable delay; and be it further

Resolved, That copies of this resolution be forwarded to the members of both houses of the Congress of the United States.

Duration of Session

The Speaker requested the Reference Committee on Rules and Order of Business to bring in recommendations concerning the possibility of the adjournment of the House on Wednesday instead of Thursday.

Resolutions on Expansion of Medically Sponsored Voluntary Group Health Care Programs

Dr. James Stevenson, Oklahoma, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Group health care programs sponsored and operated by the medical profession in many parts of the country are providing the means whereby millions of persons are able to secure good medical care and hospital service on a voluntary budgeted basis; and

WHEREAS, This health care has been rendered in a manner highly satisfactory to both patient and physician, resulting in better understanding between the two; and

WHEREAS, The voluntary type of group health care is to be preferred, in the interest of the people's health, to compulsory, political control; and

WHEREAS, Some areas of the country have no such programs in operation at the present time; and

WHEREAS, A large proportion of the people desire group health service on a national basis; therefore be it

Resolved, That the president and other officers of every state medical association use their best efforts to secure prompt action by their state association in inaugurating new, or increasing the benefits of existing, prepayment health care programs in every state; and be it further

Resolved, That the Council on Medical Service and Public Relations of the American Medical Association be instructed by the House of Delegates of the American Medical Association to correlate the various voluntary state and local programs in order to develop a group health care plan on a national basis, with uniform principles, rates and reciprocity between all, for the benefit of subscribers located in all parts of the country.

Resolutions on Expediting Return of Physicians on Duty with Military Forces to Civilian Practice

Dr. Frank R. Reeder, Michigan, presented the following resolutions, which were referred to the Reference Committee on Postwar Planning:

WHEREAS, The Senate of the United States has seen fit, by Senate Resolution 134, to cause a subcommittee of the Senate Military Affairs Committee to investigate the disparity between the ratio of civilian doctors to the population as compared with the ratio of medical officers to soldiers; and

WHEREAS, In 1942 the War Manpower Commission set up the ratio of one doctor to each 1,500 of the civilian population as a safe ratio for adequate medical care in this emergency; and

WHEREAS, It is reliably reported that the civilian ratio is now one to 1,800, while the military ratio is one to 180; and

WHEREAS, Since 1942 there have been practically no replacements in the field of civilian medicine despite an annual death rate among civilian physicians of more than 7,000 and an appreciable increase in the total civilian population; and

WHEREAS, The Army is in the process of discharging several million men, thus reducing the over-all need for medical officers; and

WHEREAS, Rather than reducing the number of medical officers there has been a net gain of approximately 600 since Jan. 1, 1945; therefore be it

Resolved, That the House of Delegates of the American Medical Association, in convention assembled, commend this action on the part of the Senate of the United States and urges that every effort be made to expedite the return to civilian practice of every medical officer who it is found can be spared from military service without endangering the lives or health of our armed forces; and be it further

Resolved, That a copy of this resolution be forwarded to each member of the United States Senate and to the Secretary of War.

Resolution on Medical Care of Veterans

Dr. Frank R. Mount, Oregon, presented, without reading, a Resolution on Medical Care of Veterans, which was submitted to the Reference Committee on Medical Care of Veterans.

Resolution on Hospital Staff Meetings

Dr. Frank R. Mount, Oregon, presented, without reading, a Resolution on Hospital Staff Meetings, which was referred to the Reference Committee on Medical Education.

Resolution on Spokesman for American Medicine

Dr. L. S. Goin, California, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The past few years have seen the development of several organizations designed to protect the corporate body of medicine from governmental encroachment, this development being the reply to the obvious demand and need for such protection; and

WHEREAS, The American Medical Association only recently has created a Council on Medical Service and Public Relations, which by reason of red tape and administrative difficulties has scarcely yet begun to serve its real purpose; and

WHEREAS, The delegates from California believe in this Council, approve of its stated objectives and are desirous of so implementing the Council that it may in fact as well as in theory accomplish those things for which it was intended; now therefore be it

Resolved, That this House directs that the Council on Medical Service and Public Relations shall be the sole spokesman for American medicine; that it shall be given whatever funds it may require to carry out the purposes for which it is intended, and that the Council be directed to retain an executive for full time service, with such secretarial assistance as he may require, the House of Delegates stating explicitly that the qualifications of such executive shall be determined only by the Council.

Resolution on Council on Medical Service and Public Relations

Dr. Dwight Wilbur, California, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The American Medical Association has created a council on public relations, known as the Council on Medical Service and Public Relations, which Council is charged with the responsibility of representing the American Medical Association to the public and governmental agencies of the United States; and

WHEREAS, The presentation of the official point of view of the American Medical Association by other councils, committees and individuals leads but to confusion and to different and divergent views, with the effect, of apparent disunity in the profession; and

WHEREAS, At this time the profession is in need of greater unity than ever before in its history; therefore be it

Resolved, That the Council on Medical Service and Public Relations shall be the sole agency for presentation of the attitude of the American Medical Association relative to matters in which the organized profession should or must make representation to the public or to the government.

Resolutions on Willingness to Cooperate in National Conference of Labor

Dr. A. F. R. Andresen, for the Medical Society of the State of New York, presented, without reading, Resolutions on Willingness to Cooperate in a National Conference of Labor, which were referred to the Reference Committee on Legislation and Public Relations.

Resolution on Asphyxial Accidents

Dr. J. Stanley Kenney, New York, presented a resolution dealing with asphyxial accidents, requesting its reference to the Council on Medical Education and Hospitals. The resolution was so referred.

Resolutions on Prompt Discharge of Medical Officers

Dr. Ivan Fawcett, West Virginia, presented the following resolutions, which were referred to the Reference Committee on Postwar Planning:

WHEREAS, Many complaints have come to us that medical officers are being kept in the Army with little or no work to do; and

WHEREAS, Many complaints are coming that medical officers since V-J day are being given combat training without any probability of it ever being useful to them in after life; and

WHEREAS, The need for civilian physicians, certainly as far as West Virginia is concerned, is very acute, some emergencies finding medical care unavailable; therefore be it

Resolved, By the Council of the West Virginia State Medical Association, that we urge on the Surgeon General of the Army and of the Navy the necessity for prompt discharge of all medical officers who can possibly be spared from the armed services; and be it further

Resolved, That a copy of these resolutions be sent to each Senator and each Representative from West Virginia, asking their aid in securing the release to civilian life of West Virginia medical officers in the armed services not actually needed; and be it further

Resolved, That a copy of these resolutions be sent to our representatives in the House of Delegates of the American Medical Association with the request that they present this matter to the House of Delegates of the American Medical Association for appropriate action.

Resolution on Establishment of Section on General Practice

Dr. H. A. Luce, Michigan, presented, without reading, a resolution dealing with the establishment of a new section, which was referred to the Reference Committee on Sections and Section Work.

Appeal from Medical Director of Northern Permanente Foundation from Action of Washington State Medical Association

Dr. Olin West, Secretary, at the request of the Board of Trustees, presented, without reading, an appeal from the medical director of the Northern Permanente Foundation, which was referred to the Reference Committee on Legislation and Public Relations.

Communications on Social Hygiene

Dr. Olin West, Secretary, presented, without reading, communications referring to social hygiene, which were referred to the Reference Committee on Hygiene and Public Health.

The House recessed at 5:40 p. m. to meet at 10 a. m., Tuesday, Dec. 4, 1945.

Second Meeting—Tuesday Morning, December 4

The House of Delegates was called to order at 10:10 a. m. by the Speaker, Dr. H. H. Shoulders.

Roll Call

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, duly seconded and carried, the House dispensed with the roll call.

Presentation of Minutes

Dr. George W. Kosmak, New York, moved that the House dispense with the reading of the minutes. The motion was duly seconded and carried.

Report of Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, reported that one hundred and seventy members of the House of Delegates had been registered.

Report of Reference Committee on Rules and Order of Business

Dr. Francis F. Borzell, Chairman, presented the following report:

Your Reference Committee on Rules and Order of Business recommends to the House of Delegates the following order of business: Tuesday: Proceed with the Order of Business for today as published on page 24 in the Handbook; Wednesday: Convene at 9:30 for the reception of reference committee reports and other business and recess in time to reconvene at 2 p. m., and proceed with the Order of Business scheduled for Thursday as published on page 25 of the Handbook; adjournment at the close of this session unless necessary business requires the House to reconvene on Thursday morning.

Respectfully submitted.

FRANCIS F. BORZELL, Chairman.
E. G. WOOD.
F. S. CROCKETT.
SAMUEL J. MCCLENDON.
LUCIUS F. DONOHOE.

Dr. George W. Kosmak, New York, moved that the report of the reference committee be adopted. The motion was duly seconded and carried, after it was definitely stated that the report carries the instruction that the election of officers would take place on Wednesday instead of Thursday.

The Speaker announced that a two-thirds vote of the House was necessary before the date of holding elections may be changed. He called for a rising vote, which indicated that the date of election was changed from Thursday, December 4, to Wednesday, December 5, by a vote of 110 for to 4 against.

Report of Reference Committee on Sections and Section Work

Dr. William Weston, Chairman, presented the following report, which was adopted on motion of Dr. H. B. Everett, Tennessee, duly seconded and carried:

Your reference committee approves a resolution by the Council on Scientific Assembly and by the Michigan State Medical Society and recommends that a proper amendment to the By-Laws be made to include a new section to be known as the Section on General Practice.

Respectfully submitted.

WILLIAM WESTON, Chairman.
O. H. WEAVER.
HUGH SMITH.
WARREN L. ALLEE.

Report of Reference Committee on Miscellaneous Business

Dr. James R. Reuling Jr., Chairman, presented the following report:

1. Resolutions on Use of Sulfonamides: The resolutions introduced by Dr. C. W. Lanc, Section on Dermatology and

Syphilology, regarding the local and general sensitization to sulfonamides was considered. Your reference committee agrees in principle with the purpose of the resolutions and recommends that the Council on Pharmacy and Chemistry use all means at its command to implement the purpose of the resolutions.

2. Resolutions on Minimum Wage Standard: With respect to these resolutions introduced by Dr. F. W. Winslow, New York, your reference committee submits that the House of Delegates of the American Medical Association has always recognized the fact that the American workingman should receive a sufficient wage so that they may all become independent individuals able to pay his or her way in purchasing the necessities of life. Your reference committee recommends that this principle be reaffirmed.

3. Resolution on Proposed International Congress on Tropical Medicine: Your reference committee has changed the last part of that resolution, as follows:

Resolved, That the American Medical Association heartily endorse the proposal of the American Academy of Tropical Medicine that an International Congress on Tropical Medicine and Malaria be held in the United States at an early date and that the American Medical Association join with the American Academy of Tropical Medicine in petitioning the State Department of the United States government officially to sponsor and invite international participation in such a gathering and direct the Secretary of the American Medical Association to advise formally the State Department of this endorsement; and be it further

Resolved, That the Board of Trustees of the American Medical Association be authorized and empowered to appoint a member of the American Medical Association officially to represent this Association at such an International Congress on Tropical Medicine and Malaria.

Respectfully submitted,

JAMES R. REULING JR., Chairman.
STEPHEN E. GAVIN.
HENRY A. LUCE.
LEONARD W. LARSON.
WILLIAM BATES.

On motions of Dr. Reuling, duly seconded and carried after discussion, the first and third sections of the report of the reference committee were adopted.

The second section of the report was tabled on motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by several and carried by a rising vote of 67 to 29.

On motion of Dr. Reuling, duly seconded and carried, the report of the reference committee was adopted as a whole with the exception of the section that was tabled.

Resolutions Rereferred

The Speaker, on motion of Dr. James R. Reuling Jr., New York, duly seconded and carried, received permission to refer the two resolutions presented by delegates from California, previously referred to the Reference Committee on Legislation and Public Relations, to the Reference Committee on Executive Session.

Report of Reference Committee on Medical Care of Veterans

Dr. W. G. Phippen, Chairman, presented the following report:

1. Address of Major General Paul R. Hawley: Your reference committee was asked to consider and comment on the address of Major General Paul R. Hawley.

Your reference committee was impressed with the sincerity and straightforwardness of General Hawley's remarks and feels that the members of the House of Delegates were likewise impressed with the desire and intention to give wounded and sick veterans the best possible medical care. It feels that he is fully cognizant of the deficiencies in the care of veterans after the first world war and some of the causes thereof and is determined to avoid them. The emergence of the medical department from the domination of lay administrators is evidence of this intent. He reasons that if a full time corps of medical officers could not take care of 4,000,000 veterans well, it certainly cannot take care of 20,000,000. He therefore looks to organized medicine to help, and largely on its own terms. He assures us that this in no way implies an entering wedge for the government control of medicine, a situation he would

deplore as much as we. It is the intention of the Veterans Administration to attract young physicians returning from the service, both to staff positions on a part time basis and to residencies, and to utilize the services of specialists wherever possible. General Hawley deplors the pressure brought to bear by Congress to force the Veterans Administration to take over army and navy hospitals but fears some new hospitals must be constructed. He is finally convinced however that, if built, they should be built where good medical service is available.

In outpatient care the Veterans Administration must lean most heavily on organized medicine. General Hawley wants the veteran to have free choice of his physician and believes this possible if all physicians participate. One difficulty that he points out is that the veteran is allowed outpatient care at government expense only for a service connected disability, which must be established before the treatment begins. Several plans for this outpatient service are being tried. One in Monmouth County, N. J., focuses around a liaison committee of the county medical society to provide proper screening and proper fees and to see that adequate treatment is provided. In Michigan the Veterans Administration buys service from the Medical Service Corporation. In Kansas the state association acts as agent for the veterans. The Veterans Administration sets up an administrative office in each state. Throughout his address General Hawley expressed absolute confidence in organized medicine and was loud in his praise of what it has accomplished, particularly in the education of doctors.

Your reference committee therefore recommends that the House of Delegates pledge its support to General Hawley in his effort to provide the best medical care under the Veterans Administration.

2. Principles Dealing with Medical Care for Veterans Adopted by Medical Society of New Jersey and Resolution on Medical Care of Veterans: Your reference committee was also asked to consider three resolutions, all pertaining to the medical care of veterans. Those resolutions presented from New Jersey and Oregon we feel have been fully covered in principle by the action on the address of Major General Hawley just considered by the House and need no further action.

The committee begs the indulgence of the House for permission to make a supplementary report concerning the third resolution.

Respectfully submitted,

WALTER G. PHIPPEN, Chairman.
FORREST L. LOVELAND.
JAMES C. SARGENT.
HENRY R. VIETS.
LELAND S. MCKITTRICK.
PARKE G. SMITH.
BRITTON E. PICKETT SR.

The first section of the report of the reference committee, referring to the address of Major General Hawley, was adopted without dissenting vote, on motion of Dr. Phippen, duly seconded and carried.

Dr. Phippen moved that the second section of the report of the reference committee, dealing with two resolutions on medical care of veterans, be adopted. The motion was duly seconded and carried.

The House, on motion duly made, seconded and carried, recessed at 11 a. m. to reconvene at 11:30 a. m.

The Speaker called the House to order at 11:45 a. m.

Communication Rereferred

The Speaker, on motion of Dr. Arthur J. Bedell, Section on Ophthalmology, duly seconded and carried, rereferred to the Judicial Council the appeal from the Medical Director of the Northern Permanente Foundation from the action of the Washington State Medical Association which had been referred to the Reference Committee on Legislation and Public Relations.

Report of Reference Committee on Medical Education

Dr. Fred M. Smith, Chairman, presented a report, which on motion, duly seconded and carried, was adopted section by

section and as a whole as amended. The amended report reads as follows:

1. The report of the Council on Medical Education and Hospitals as it appears in the Handbook of the House of Delegates, pages 139-162. Your reference committee approves this report.

2. The Supplementary Report of the Council on Medical Education and Hospitals recommending support of the proposals in the report of Vannevar Bush to the President: Your reference committee also approves this report with the addition of the following paragraph:

"Of the legislation thus far introduced into Congress, the Magnuson bill (S. 1285) most nearly follows the recommendations of the Bush report, especially as regards the method of appointment and organization of the National Research Foundation. The recommendations of the Bush report and the provisions of the Magnuson bill on this question give more promise of achieving the desired ends than do the provisions of other bills before Congress."

3. Resolution on Asphyxial Accidents: Regarding the resolution concerning instruction of doctors of medicine in the treatment of asphyxial accidents, your reference committee approves the resolution in principle and recommends that it be implemented by sending reprints of the survey report by the Council on Physical Medicine of the American Medical Association published in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* on Oct. 6, 1945 to the heads of the physiology, surgery and, if possible, obstetric departments of approved medical schools as well as to hospitals approved for internship and residency training.

4. Resolution on Hospital Staff Meetings: Regarding the resolution concerning the frequency and content of hospital staff meetings, your reference committee recommends that the wording of the resolution be changed as follows:

"Resolved, That the frequency of staff meetings in a hospital should be determined by the needs of the hospital itself and in conformity with the regulations set forth by the House of Delegates in the 'Essentials of a Registered Hospital' reading as follows:

"Staff meetings should be held for the review of the work of the hospital, the discussion of results, the report of autopsies, pathologic studies, presentation of papers and such other matters as concern the professional work of the hospital."

5. The recommendation of the Council on Medical Service and Public Relations that "... the American Medical Association request the Procurement and Assignment Service and the Army, Navy and Public Health Service to ascertain at the earliest time the future policy relating to the deferment of medical officers to serve as residents ...": Your reference committee finds that this has already been carried out and the policies of these governmental agencies were published in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*, Nov. 17, 1945, page 808, under the title "Reconversion of the 9-9-9 Program."

6. The further recommendation of the Council on Medical Service and Public Relations for "... the more prompt approval of hospitals for residencies ... and for arrangements to provide ... temporary approval until formal inspections can be made": Your reference committee finds that this has been receiving the attention of the Council on Medical Education and Hospitals, which is developing a plan to meet these ends in collaboration with the Advisory Board for Medical Specialties and the various American boards in the specialties. It approves of the recommendation.

7. Resolution on Early Return of Physicians and Medical Students Now in Military Service: Your reference committee approves this resolution with the following modified wording:

"Resolved, That the American Medical Association and its official representatives continue to support strongly such programs as may be desirable to assure not only the early return of medical veterans to civilian practice but also the early return from military service of qualified medical and premedical students whose training was interrupted by induction into the armed forces. The strongest efforts directed toward the deferment of qualified premedical students should also be continued."

8. Resolutions on Appointment of Committee for the Studying of Nursing Problems and Education: Your reference committee approves the resolutions with the following rewording:

"Resolved, That the activities of the Council on Medical Education and Hospitals of the American Medical Association, collaborating with the

National Nursing Council for War Services, the Special Committee on Accrediting of the National League of Nursing Education, the National Organization of Public Health Nurses and the National Association of Practical Nurse Education, be continued and that there be carried out a joint exploration into the problem of nursing education, establishment of national standards in nurse education, definition of the aims to be sought in nursing education and the level of professional competence most desirable among nurses; and be it further

"Resolved, That the Board of Trustees of the American Medical Association give consideration to lending financial assistance in the furthering of these goals, especially as regards the establishment of acceptable national standards for schools of nurse education."

Respectfully submitted,

FRED M. SMITH, Chairman.
THOMAS S. CULLEN.
GEORGE W. KOSMAK.
LEON J. MENVILLE.
A. W. ADSON.

Proposed Amendments to By-Laws, Chapter XV

Dr. A. A. Walker, Alabama, presented the following proposed amendments to the By-Laws, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws:

In order to make effective the recommendation of the Council on Scientific Assembly creating a Section on General Practice, which recommendation has received the approval of this House, the following amendments to the By-Laws are hereby proposed: Change chapter XV, section 1, subdivision 1, to read "Internal Medicine." Change chapter XV, section 1, subdivision 17, to subdivision 18, and insert a new subdivision 17 to read "General Practice of Medicine."

Resolutions on Health Legislation Beneficial to the People

Dr. H. H. Bauckus, New York, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, It is the earnest desire of the medical profession of this country to provide better health care for the American people and improve health facilities and standards, therefore be it

Resolved, That the following principles for a health legislation program be adopted:

1. Establishment in the President's cabinet of a Secretary of Public Health and Medical Welfare, who shall be selected from the ranks of actively practicing physicians and under whose jurisdiction every federal bureau and office whose duties are related to health and medical welfare shall be grouped;

2. Encouragement of medical and other scientific research and study for the continuous improvement of medical care by government grants-in-aid;

3. Provide federal or state loans or guaranties of private loans for the expansion of hospital and educational facilities, the operation of same to be entirely supervised, controlled and carried on by those who own such facilities and by the medical profession;

4 (a). Establish statewide voluntary nonprofit health care programs, in every state, based on the free choice of purveyors of health care; such programs shall act as a service plan to all in groups classified as within a special income level as determined by the plan in each state or regional unit; as an indemnity plan for those classified as above that income level by each state or regional unit; as a service plan to the indigent and semi-indigent by contractual arrangement for payment of charges from county, state or federal funds; as a service plan for all other governmental categories eligible for health care; as a service plan for all physicians' services to veterans of the armed forces for all illnesses or disabilities eligible under the law;

4 (b). Any further federal or state programs for expansion of medical service to be developed within the structure of the before described program;

4 (c). National cooperation with the proposed plans of Major Gen. Paul R. Hawley of the Veterans Administration in the therapeutic administrations to veterans for service connected disabilities. Also for the development of veteran facilities as teaching hospitals under the medical direction of civilian consultants in the respective specialized medical departments;

4 (d). All statewide medical care programs on either a service or indemnity care basis shall be incorporated under special state enabling acts or by already existing state statutes relating to nonprofit producers' cooperatives. This will provide for either a prepayment or a reimbursement contractual service;

4 (e). Group cooperation and reciprocity, on a national level, by all voluntary state medical and hospital care (Blue Cross) programs should be accomplished;

5. We suggest establishment in communities where feasible of a public information and educational service adequately financed, to prevent illness, to provide hygienic and sanitary measures and to inform where to go to seek help when ill or injured;

6. The function of government, federal and state, should be to encourage and assist, rather than to compete with, reputable voluntary health insurance plans, and be it further

Resolved, That every state medical society be invited to study, adopt and activate these principles on the state level and that they be submitted to the Council on Medical Service and Public Relations of the American Medical Association for immediate consideration as a pattern for a national health program

Resolution on National Physicians Committee

Dr. G. Henry Mundt, Illinois, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The members of this House of Delegates as well as physicians throughout the United States are cognizant of the increasingly effective work of the National Physicians Committee for the Extension of Medical Service in familiarizing the public with the values, methods and achievements of American medicine, therefore, be it

Resolved, That we reaffirm our approval of the activities of the National Physicians Committee and commend the Board of Trustees and the management of this institution for the effectiveness of their efforts

Resolution on Removal of Sex Discrimination from Medical Students

Dr. Emily D. Barringer, New York, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, In these postwar days, the equality of the sexes is one of the fundamental concepts of freedom on which a true and lasting peace may be built and so was voiced at the San Francisco Conference, and

WHEREAS, There is a recognized shortage of physicians to meet the postwar needs; and

WHEREAS, The quota of women students is still limited in the medical schools and women physicians are still approximately only 5 per cent of the total number of licensed physicians, and

WHEREAS, In a recent article in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION statistics show that a high percentage of women physicians make use of their education and continue active in their medical work, therefore be it

Resolved, That the American Medical Association go on record as approving the removal of sex discrimination from the medical student and that henceforth a woman medical student be judged purely by her individual qualifications

Resolutions on Modern Medical Public Relations

Dr. C. C. Sherburne, Ohio, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The economic trends of medicine point to an increasing effort on the part of organized minorities to regiment medicine; and

WHEREAS, The medical profession must take the public more and more into its confidence and tell all the people what medicine has done, is doing and intends to do for the public good, and

WHEREAS, Organized medicine urgently needs full time public relations activity not only on a national level but in every state of the Union to inform the public properly of its ideals and programs; therefore be it

Resolved, That the president and other officers of each state medical society use their influence to create a well financed public relations program in every state medical association at the earliest possible moment, and be it further

Resolved, That the Council on Medical Service and Public Relations of the American Medical Association be instructed by the House of Delegates of the American Medical Association to offer sustained leadership to state medical associations in their public relations programs, especially through the example of an immediate and outstanding program of medical public relations on a national level employing newspapers, commercial radio and movies, and all other modern mediums to bring medicine's glorious story to the American people

Resolution Rereferred

The Speaker, with the consent of the House, rereferred the resolution introduced by Dr. G. Henry Mundt to the Reference Committee on Miscellaneous Business instead of the Reference Committee on Legislation and Public Relations, to which it had previously been referred.

Resolutions on Formation of a National Health Congress

Dr. E. S. Hamilton, Illinois, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Proposed federal legislation to socialize health service would regiment doctors of medicine, dentists, hospitals, nurses, pharmacists and the people whom they serve, and

WHEREAS, The medical and allied health professions are intensely interested in bringing the greatest amount of health protection to all

people in this nation, through those means which will both preserve and extend the high standards of health now prevailing in this country; and

WHEREAS, In order to preserve quality health care for the people of this nation, each of these groups favors voluntary nonprofit prepayment plans instead of health services under compulsory governmental control; and

WHEREAS, While each of the groups in the health field has its own organization, working independently for the preservation of the American system of health care, an overall body or council is necessary to integrate the necessary collective thinking and activity of all organizations or units, and

WHEREAS, A serious and immediate need exists to develop a working liaison or congress of all agencies in the health field to secure the most effective results of action and public education; therefore be it

Resolved, That this body recognizes the need for a National Health Congress representative of the medical, dental, hospital, nursing pharmaceutical and allied professions, and that it approves the creation of such a coordinating body, and be it further

Resolved, That the Council on Medical Service and Public Relations of the American Medical Association be instructed by the House of Delegates of the American Medical Association to take the initiative in bringing together the interested groups to organize and incorporate immediately a National Health Congress, this congress to undertake to bring to all the people of this nation the complete benefits of modern medical dental science and the finest hospital facilities, to arrange for budgeting the cost of such services at monthly rates within the financial means of all Americans through voluntary, nonprofit health plans and to work speedily for the institution of such voluntary nonprofit health plans in those places or localities where they do not now exist.

The House recessed at 12:30 p. m. to meet in Executive Session at 2 p. m.

Tuesday Afternoon, December 4

The House of Delegates was called to order at 2 p. m. by the Speaker, Dr. H. H. Shoulders.

Report of Reference Committee on Rules and Order of Business

Dr. F. F. Borzell, Chairman, presented the following report, which, on motion of Dr. Robert E. Schlueter, Missouri, duly seconded and carried, was adopted:

Resolved, that the House now go into executive session to receive the report of the Reference Committee on Executive Session; and further be it

Resolved, that in addition to the accredited delegates and members of this House of Delegates the following may be in attendance: all accredited Fellows of the American Medical Association, officers, executive secretaries, lay secretaries who are approved by their accredited representatives, and editors of state and county societies, all others to be excluded.

Executive Session

The Sergeant-at-Arms polled the House, and after a short recess the House went into Executive Session.

Report of Reference Committee on Executive Session

Dr. Walter F. Donaldson, Chairman, presented the following report:

Three resolutions were referred to the committee, the first being a resolution regarding the activities of employees of the American Medical Association.

1. Resolution on Activities of Employees of American Medical Association: Your reference committee, aided by the comments of those who attended its hearing and by careful subsequent consideration, respectfully submits the following as its reaction to said resolution: Article 2 of the Constitution of the American Medical Association in twenty words sets forth the objects of the Association as being to promote the science and art of medicine and the betterment of public health. Section 1 of chapter VI of the Association's By-Laws states that the Board of Trustees shall appoint a General Manager and an Editor of THE JOURNAL and such assistants as may be necessary and shall determine their salaries and the terms and conditions of their employment. Therefore there seems to be little doubt that this resolution, if adopted by the 1945 House of Delegates, would, in effect, express a definite criti-

cism of the administration by the current Board of Trustees, whose multiple, year-round activities involve interim supervision and responsibilities for the success or failure of the policies and plans authorized and approved by each succeeding House of Delegates. Never has this Association stood in greater need of harmony between its legislative and administrative bodies than in the coming year 1946. Your Reference Committee on Executive Session is confident that the Board of Trustees is devoted to and capable of developing and maintaining the most efficient organization possible in the solution of the Association's present pressing problems, provided it has the support of the membership. To this end we would call to the attention of the entire membership of the Association that in the interim between meetings of the House of Delegates the Board of Trustees is an ever open and easily approached avenue for criticism or complaint. We also urge each member of the House of Delegates and others present to make it clear to their constituency that Fellows of the Association will always find warm welcome should they care to attend the meetings of the House of Delegates. Your committee heartily recommends this in order that the members throughout the constituent associations may be properly impressed with the democratic structure and processes of the House of Delegates. Your reference committee recommends to the House that this resolution be not approved.

2. Resolutions on Spokesman for American Medicine and Resolution on Council on Medical Service and Public Relations:

Your reference committee has taken the liberty of considering these resolutions jointly, which deal with expansion of the functions and the implication of the already multiple duties and activities of the Council on Medical Service and Public Relations. The present duties of this council are clearly defined in the By-Laws of the Association, which, of course, are at all times subject to amendment. The members of your reference committee have learned through interviews with members of similar councils of constituent state medical associations that it has been a common experience that the magnitude of the subjects assigned to each such council, none of which have been in existence more than two years, has tended to create a certain degree of confusion strongly suggestive that more time will be required for crystallization of activities within the limitations of time available to the personnel of such councils. The members of our committee learned at its hearing this morning, from a former and the current chairman of the Council on Medical Service and Public Relations, that the Board of Trustees of the American Medical Association has throughout shown a completely cooperative attitude and has been generous in the provision of funds and of personnel. It learned too from those who presented the resolutions that their basic objective was and is to encourage the Association and to assist in every way possible in bringing about not only effective but timely action by this new and important council.

With these ideas in view, your reference committee unanimously recommends that the resolutions dealing with the future of the Council on Medical Service and Public Relations be not approved.

Respectfully submitted,

WALTER F. DONALDSON, Chairman.
EDWARD JELKS.
JAMES R. McVAY.
WILLIAM R. BROOKSHER.
THOMAS P. MURDOCK.
W. CLARK BAILEY.
ALLEN H. BUNCE.

Dr. Donaldson moved that the first section of the report of the reference committee, disapproving the Resolution on Activities of Employees of the American Medical Association, be adopted, and the motion was seconded by Dr. A. A. Walker, Alabama. After discussion by several, it was moved by Dr. James P. Kerby, Utah, duly seconded and carried by a vote of 88 to 48 that the vote on the adoption of this section be by secret ballot.

The Speaker requested the tellers to spread the ballot for a vote on the adoption of the first section of the report of

the reference committee. The tellers spread the ballot, the Speaker declared the ballot closed and the Secretary announced that 166 votes had been cast, of which 106 were for the adoption of the first section of the report of the reference committee and 60 were opposed.

The Chairman ruled that the first section of the report of the reference committee, disapproving the Resolution on Activities of Employees of the American Medical Association, had been adopted.

It was moved by Dr. Donaldson that the second section of the report of the reference committee, disapproving two resolutions dealing with the functions of the Council on Medical Service and Public Relations, be adopted. Dr. L. S. Goin, California, desired to enter a motion for the amendment of one of the resolutions, which amendment he read and moved its adoption. The motion was seconded by Dr. John W. Cline, California. After discussion, the Speaker ruled that the House hear Dr. Donaldson's report before considering any amendment.

Dr. Donaldson completed the reading of the second section of his report and moved its adoption. Dr. L. S. Goin moved that this be rereferred to the reference committee, and the motion was seconded and carried after discussion by several and this section of the report of the reference committee was rereferred to it.

Report of Reference Committee on Legislation and Public Relations

Dr. E. S. Hamilton, Chairman, presented the following report:

Assigned to the Committee on Legislation and Public Relations was the message of President Harry Truman submitting a national health program on November 19 and the latest version of the Murray-Wagner-Dingell bill submitted to the Senate and the House of Representatives on the same day.

The President's program includes five features.

1. The first is the proposal to grant federal aid for the building of hospitals and health centers throughout the nation. The Board of Trustees of the American Medical Association has approved the principles of the Hill-Burton bill, and the committee recommends that the House of Delegates endorse this action of the Board as being within the program of constructive action toward improving the health of the American people.

2. The second recommendation of President Truman is for an extension of maternal and child health services. The Murray-Wagner-Dingell bill would make this effective by increased grants in aid through the Children's Bureau to the individual states. A much more far reaching proposal is that of the Pepper bill for maternal and child health. These programs would tend to turn over to a federal agency the medical care of every mother in childbirth and of the children of the United States up to the age of 21 years. This constitutes an insidious attempt to turn over to the federal government functions that are definitely those of the medical profession. In this connection the reference committee urges that the House of Delegates recommend again the removal of the Children's Bureau from the Department of Labor to the United States Public Health Service in the Federal Security Agency. The American Medical Association has always favored proper aid for the extension of maternal and child health services where the need can be shown.

3. The third feature of the President's message dealt with the development of the National Research Foundation. The Committee on Postwar Medical Service, the Council on Medical Education and Hospitals and the Board of Trustees of the American Medical Association have approved the principles of the Magnuson bill, which would place the control of the National Research Foundation under a scientific board of directors rather than under an individual director to be appointed by the President. Your reference committee approves the action taken by those official bodies of the American Medical Association and urges that the House of Delegates support their recommendation.

4. The fifth proposal in the President's program is compensation for the loss of earnings due to sickness. The American Medical Association through its House of Delegates has consistently favored such insurance. Your reference committee recommends that the House of Delegates again register its approval of such action.

5. Finally, the fourth proposal of President Truman and the main feature of the Wagner-Murray-Dingell bill is the creation of a federal system of compulsory sickness insurance. In commenting on this proposal your reference committee recommends that the House of Delegates endorse the following statement from the editorial published in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*, Dec. 1, 1945:

No one will ever convince the physicians of the United States that the Wagner-Murray-Dingell bill is not socialized medicine. By this measure the medical profession and the sick whom they treat will be directly under political control. By this measure the great system of private hospitals and community hospitals that has grown up in our country will depend for their continued operation on funds paid to them by a federal government agency. By this measure the philanthropic efforts for the care of the sick, which have been the pride of our nation, will be forever deterred. Through this measure competent young men who would enter the medical profession will be forced to seek other fields of action still remaining under our democracy which still permit the exercise of individual initiative and freedom of thought and action. By this measure doctors in America would become clock watchers and slaves of a system. Now, if ever, those who believe in the American democracy must make their belief known to their representatives, so that the attempt to enslave medicine as first among the professions, industries and trades to be socialized will meet the ignominious defeat it deserves.

Your reference committee recommends that the House of Delegates express official disapproval of section 4 of the Wagner-Murray-Dingell bill for the following reasons:

1. The Wagner-Murray-Dingell bill is founded on the false assumption that solution of the medical care problem for the American people is the panacea for all of the troubles of the needy.

2. This is the first step in a plan for general socialization not only of the medical profession but of all professions, industry, business and labor.

3. Positive proof exists from experience in other countries that inferior medical service results from compulsory health insurance.

4. A program such as outlined is enormously expensive. It will result in greatly increased taxes for the entire population of the United States.

5. Voluntary prepayment medical plans now in operation in many parts of the United States and which are rapidly increasing in number will accomplish all the objects of this bill with far less expense to the people, and under these plans the public will receive the highest type of medical care without regimentation.

Respectfully submitted,

EDWIN S. HAMILTON, Chairman.
LLOYD NOLAND.
JOHN J. MASTERSON.
EDWARD L. BORTZ.
RAYMOND L. ZECH.

Dr. Hamilton moved adoption of the first section of the report of the reference committee, dealing with President Truman's message on the proposal to grant federal aid for the building of hospitals and health centers, and the motion was duly seconded and carried unanimously.

It was moved by Dr. Hamilton that the second section of the report of the reference committee, concerning an extension of maternal and child health services, be adopted, and the motion was duly seconded. After discussion, it was moved by Dr. Arthur J. Bedell, Section on Ophthalmology, seconded and carried, that this section of the report of the reference committee be rereferred to it.

On motion of Dr. Hamilton, seconded and carried, the third section of the report of the reference committee, dealing with the development of the National Research Foundation, was adopted.

Dr. Hamilton moved, and the motion was seconded, that the fourth section of the report of the reference committee,

with respect to President Truman's message regarding compensation for the loss of earnings due to sickness, be adopted. On motion of Dr. Francis F. Borzell, Pennsylvania, seconded and carried, this section of the report of the reference committee was rereferred to it.

The fifth section of the report of the reference committee, recommending disapproval of section 4 of the Wagner-Murray-Dingell bill, was adopted on motion of Dr. Hamilton, seconded and carried.

On motion of Dr. Francis F. Borzell, Pennsylvania, seconded and carried, the House rose from Executive Session.

Tuesday Afternoon—Continued

On motion of Dr. Walter E. Vest, West Virginia, seconded and carried, the House reconvened in regular session.

Report of Reference Committee on Hygiene and Public Health

Dr. Felix J. Underwood, Chairman, presented the following report, which on motions of Dr. Underwood, duly seconded and carried, was adopted section by section and as a whole:

Your reference committee has considered that portion of the report of the Board of Trustees dealing with the activities of the Bureau of Health Education, as shown in the Handbook, pages 61-68. It notes with satisfaction the excellence of the report. It is in complete accord with the substance of the report and the work done and urges on the Board of Trustees the necessity of furnishing adequate funds to carry on and develop further the program and activities of this Bureau.

1. Present Views of Profession on Social Hygiene:

Your committee has considered the letter of Dr. Ray Lyman Wilbur to Dr. Olin West, under date of November 28, 1945, relative to previous resolutions as to social hygiene (a) as adopted in 1917: "1. That sexual continence is compatible with health and is the best prevention of venereal infections; 2. That steps be taken toward the eradication of venereal infections through the repression of prostitution, and by the provision of suitable recreational facilities, the control of alcoholic drinks and other effective measures; 3. That plans be adopted for centralized control of venereal infections through special divisions of the proper public health and medical services; 4. That the hospitals and dispensaries be encouraged to increase their facilities for early treatment and follow-up service for venereal diseases as a measure of national efficiency; 5. That the members of the medical profession be urged to make every effort to promote public opinion in support of measures instituted in accordance with these principles of action in the control of venereal diseases."

(b) as adopted in 1942: "First, that the control of venereal disease requires elimination of commercialized prostitution; second, that medical inspection of prostitutes is untrustworthy, inefficient, gives a false sense of security and fails to prevent the spread of infection; third, that commercialized prostitution is unlawful, and physicians who knowingly examine prostitutes for the purpose of providing them with medical certificates to be used in soliciting are participating in an illegal activity and are violating the principles of accepted professional ethics."

Your reference committee is in accord with the declaration of the House of Delegates of the American Medical Association at the annual session in 1917 and again in 1942 and recommends the reaffirmation of these principles and that the public health authorities and the medical profession of the country be entrusted with the responsibility of carrying them out.

2. Resolution on Christmas Seal Drive of National Tuberculosis Association: Your reference committee has considered the resolution presented by Dr. Burt R. Shurly, Michigan, relative to the distribution of the funds secured from the tuberculosis seal sale in Detroit. Except for this resolution and Dr. Shurly's personal remarks, your reference committee is not informed as to any change of policy on the part of the National Tuberculosis Association. It recommends that this resolution be referred to the Board of Trustees for such action as in its judgment is appropriate.

3. Resolutions on Transfer of Children's Bureau: Your reference committee has considered the resolution presented by Dr. O. W. H. Mitchell, New York, relative to the transfer of the health services of the Children's Bureau to the U. S. Public Health Service.

It is the opinion of your reference committee that the Children's Bureau of the United States Department of Labor should be transferred to the Federal Security Agency until such time as the Congress creates a national department of health with a qualified physician as its director with cabinet status, and it recommends that the House of Delegates of the American Medical Association go on record accordingly.

Respectfully submitted,

FELIX J. UNDERWOOD, Chairman.
WARREN F. DRAPER.
D. F. CAMERON.
WALTER E. VEST.
CREIGHTON BARKER.

Report of Reference Committee on Medical Care of Veterans

Dr. Walter G. Phippen, Chairman, presented the following report, which on motion of Dr. Phippen, seconded and carried, was adopted:

Your reference committee has thoroughly discussed the Resolutions on Future Medical Care of Veterans introduced by Dr. James C. Sargent, Wisconsin, and offers the following substitute resolution:

Resolved, That the House of Delegates of the American Medical Association at this time reaffirms its long established opposition to extending the benefits under the Veterans Administration to encompass those disabilities obviously not service connected.

Respectfully submitted,

WALTER G. PHIPPEN, Chairman.
FORREST L. LOVELAND.
JAMES C. SARGENT.
HENRY R. VIETS.
LELAND S. MCKITTRICK.
PARKE G. SMITH.
BRITTON E. PICKETT SR.

Reference Committee on Reports of Officers

Dr. Floyd S. Winslow, Chairman, presented the following report, which on motions of Dr. Winslow, duly seconded and carried, was adopted section by section and as a whole:

1. Address of Speaker of House of Delegates, Dr. H. H. Shoulders: Your reference committee views with commendation and profound appreciation the thoughts of our Speaker in reference to the ideals of medicine. He sounded a refreshing note in reviewing the impelling motif which has dominated this organization for nearly a century.

He particularly stresses the warning that in the efforts of the profession to stave off political encroachment it should not lose this impelling motif or shirk its responsibility for continuing the preservation of the best in American medicine.

2. Address of President-Elect Roger I. Lee: Dr. Lee, in his own inimitable style, delivered an address in which he gave utterance to his observations concerning organized medicine in America resulting from thirty years of continued activities in many capacities. Our sincere appreciation of his words can best be expressed by the recommendation that every member of the House read carefully his address when it appears in printed form.

Your reference committee recommends that this address be called particularly to the attention of the state and county societies. It recommends that they make use of their rights and duties as members of this democratic organization and instruct their delegates that action of this House of Delegates represents the majority opinion from the doctors of our country. It concurs with Dr. Lee's opinion and recommends to the House of Delegates the authorization of an ad interim meeting.

3. Address of President Herman L. Kretschmer: Your reference committee recommends particularly to the House of Delegates the constructive address of the retiring President, in

which he presents matured views on policy issuing from his recent experience as President and his long prior services as an officer of the Association. The specific recommendations made by Dr. Kretschmer are dealt with as follows: (1) Your reference committee approves his statements on the subject of regimentation of the practice of medicine.

(2) His suggested and well rounded plans regarding programs of county medical societies meet with the approval of the reference committee and it agrees with Dr. Kretschmer that more physicians should actively participate in the work of county medical societies and it recommends that his suggestion be brought to the attention of county and state medical societies.

(3) This reference committee recognizes the problems referred to by Dr. Kretschmer concerning availability of roentgenologic studies, but it believes that his statement should be clarified as follows: "With reference to the President's remarks about the desirability of surrendering to patients possession of films employed in x-ray examinations, the reference committee would point out that the Principles of Medical Ethics requires that 'in their consultation, the benefit to be derived by the patient is of first importance.' Your reference committee believes that adherence to this dictum will adequately protect the interests of patients who are referred to a radiologic consultant for examination by one physician and who later change to another attending physician. The American College of Radiology has promulgated principles for the guidance of all radiologists recommending that, when a patient changes the attending physician, the radiologist should freely transmit the result of his examination to the second doctor. Great harm would be done and disservice to the patient would result if, in practice, patients were given the possession of x-ray films which are the legal property of the radiologist or institution in which they were produced. In actual experience, patients who obtain possession of such clinical records too often take them to an irregular practitioner who is unqualified to interpret them or who may use them to the patient's own injury by reading into them nonexistent pathologic conditions. Any competent physician is entitled to inspect x-ray films used in an examination of his patient regardless of who ordered the examination. It should be emphasized that the roentgenologist considers it ethically obligatory to furnish reports and, as requested, to lend films to the physician currently treating any patient."

(4) Your reference committee decries the exploitation of the hormones as brought up by our President. It wishes to emphasize the necessity of all therapy being based and established on scientific facts and not on claims of the manufacturers and their agents.

(5) Your reference committee emphasizes the recommendation in the President's address that the public be educated to understand that the use of animals is inseparable from the modern practice of medicine and indispensable to progress in the control and alleviation of disease. It suggests, therefore, that the term "animal experimentation" with its unfortunate connotations be replaced with the term "utilization of animals in medical instruction, research, diagnosis and therapy."

(6) As lack of precise knowledge of the pharmacologic action of marihuana delays legal enactment possibly needed and creates confusion in medical practice, it is considered urgent that studies and actions of the effects of the drug be carried to early completion.

(7) Experience shows that it is necessary that steps be taken to maintain an uninterrupted supply of personnel for medicine and its allied sciences during national emergencies.

(8) Your reference committee recommends encouragement of further study in the field of chronic illness.

(9) The subject of returning medical officers is being handled as a problem of professional rehabilitation.

Respectfully submitted,

FLOYD S. WINSLOW, Chairman.
THOMAS K. LEWIS.
DEERING G. SMITH.
HAROLD W. SMITH.
GEORGE H. CURFMAN.

Report of Reference Committee on Postwar Planning

Dr. Charles H. Phifer, Chairman, presented the following report, which on motion of Dr. Phifer, duly seconded and carried, was adopted section by section and as a whole:

1. Report of the Committee on Postwar Medical Service: In reviewing the report of the Committee on Postwar Medical Service, your reference committee was impressed at once not only by the plan and scope of the work of this committee but also by the thoroughness and detail of its efforts. It would commend to the delegates and to all members of this Association the careful reading of this report and particularly the published proceedings of this committee which have appeared from time to time in the columns of *THE JOURNAL*.

These studies will present the accumulation of a mass of information and data which should contribute in a large measure to the ultimate solution of many of the pending and vexing problems confronting us. We note with satisfaction the liaison effected with other national organizations and governmental agencies concerned with many of these same problems.

Your reference committee cannot commend too highly this type of constructive planning and takes this opportunity to compliment and felicitate the gentlemen who have given so freely of their time and great abilities to do this work. The committee has displayed mature comprehension and understanding in the handling of numerous confusing and controversial subjects.

Your reference committee desires also to congratulate the Board of Trustees for its wisdom and judgment in appointing as personnel with this committee men of the caliber and proved competence who make up its membership. It hopes and would respectfully suggest that this House of Delegates express its appreciation and full support of the work the committee is doing. Your reference committee recommends to the House of Delegates the continuation of this Committee on Postwar Medical Service at the pleasure of the Board of Trustees.

2. Conditions in the Philippines: Your reference committee desires to state that after carefully reviewing the special report of Dr. James E. Paullin to the Board of Trustees in reference to the tremendous destruction of hospitals, university buildings, medical schools, libraries and churches in the Philippine Islands it is deeply impressed with the seriousness of the situation and presents for your approval the following resolutions:

WHEREAS, The Board of Trustees of the American Medical Association implemented a special health survey of the Philippine Islands; and

WHEREAS, This investigation discloses the serious need for surgical supplies, x-ray apparatus, drugs, chemicals and other necessary equipment; and

WHEREAS, The American Medical Association feels morally obligated to the members of the constituent medical society; be it

Resolved, That the House of Delegates of the American Medical Association request the Surgeon General of the U. S. Public Health Service and the Federal Security Administrator to use their influence in having any supplies or property not being used by our hospitals in Manila given to the civilian hospitals in the Philippine Islands and to the University of the Philippines; and be it further

Resolved, That a copy of these resolutions be sent to the Surgeon General of the U. S. Public Health Service, the Federal Security Administrator, Hon. Paul D. McNutt, the high commissioner of the Philippine Islands and the secretary of the Philippine Medical Association.

3. Resolution on Recognition of Physicians Who Served on Procurement and Assignment Service in Various States: Your reference committee considered the attached resolution presented by Dr. William Stovall, Wisconsin. The committee would like to restate for the information of all physicians that the idea of an organization like the Procurement and Assignment Service for Physicians, Dentists and Veterinarians was initiated by the the Committee on Medical Preparedness of the American Medical Association created by the House of Delegates. It was created by the executive order of the President of the United States on the recommendation from this body. It represented an exceptional and singular achievement in the war effort. It operated quite apart from the other functions of Selective Service. These professions were the only divisions of our civilian society accorded the right and privilege of processing its own men for military service. This was an outstanding voluntary service, and those physicians who served in the various capacities in this office did so unstintingly and unself-

ishly. It is the opinion of your reference committee that suitable recognition of these services will be forthcoming from the proper government authorities. Your reference committee recommends disapproval of this resolution.

4. Report of Section on Placement of Medical Officers of Council on Medical Service and Public Relations:

(a) Intern Resident Policy: Your reference committee has information that the recommendation in the resolution of the Council has been accomplished since it was adopted on October 19-20 by the Council.

The Vice Speaker assumed the chair.

(b) Payments Under Public Law 346: "It is recommended that all discharged medical officers be given terminal leave pay at the termination of their active duty and prior to the expiration of such accrued leave as they may have, thus enabling them to participate immediately in the benefits provided by Public Law 346 (78th Congress, G. I. Bill of Rights). Such a procedure will enable the returned medical officer to commence immediately his training in hospitals or medical schools after leaving the armed services." Your reference committee recommends the approval of the recommendation of the Council on this subject.

(c) Approved Hospital Residencies: Your reference committee is informed that the Council on Medical Education and Hospitals has endorsed this problem and it recommends its approval.

(d) The Bureau of Information: Your reference committee recommends approval of the recommendation of the Council with respect to the Bureau of Information.

"Each state medical society should be urged to establish an information service. This state information service should collect from various public and private agencies data relating to medical facilities, medical personnel or medical needs and other information concerning medical care within the state. This information service should at all times be in a position to furnish information concerning areas in need of physicians and a complete picture of the medical facilities, physical and economic aspects of any community within the state."

Your reference committee also recommends approval of the Council's recommendation regarding establishment of information services by constituent state medical associations.

5. Resolutions on Expediting the Return of Physicians on Duty with the Military Forces, Resolution on Prompt Discharge of Medical Officers and Resolutions on Earliest Possible Release of Physicians from Military Service: Your reference committee has received these three resolutions, the first one from Dr. Frank E. Reeder, Michigan, the second from Dr. Ivan Fawcett, West Virginia, and the third from Dr. C. R. Keyport, Michigan. As the figures contained in these resolutions are somewhat out of date, it is the opinion of your reference committee that these figures should be deleted, the three resolutions combined and acted on as one. Your reference committee is heartily in accord with the principles contained in all the resolutions, namely that those medical officers in our military forces who are not vitally needed should have immediate consideration for release, and an effort should be made promptly to initiate and consummate their immediate separation.

Resolved, that a copy of this recommendation be sent to the Secretary of War, the Secretary of the Navy, the Surgeon General of the Army, the Surgeon General of the Navy, the Surgeon General of the United States Public Health Service and the Federal Security Administrator.

Respectfully submitted,

CHARLES H. PHIFER, Chairman.
J. STANLEY KENNEY.
LEO G. CHRISTIAN.
F. J. L. BLASINGAME.
HARRY V. PANYZEK.
B. R. KIRKLIN.
J. MORRISON HUTCHESON.

Telegram on Deferment of Prospective Medical Students

Dr. Olin West, Secretary, presented the following telegram received from Drs. Harvey Stone, Baltimore, and Frank H.

Lahey, Boston, which was referred to the Reference Committee on Medical Education:

We suggest the adoption of this statement by the House of Delegates.

This society, in common with all other medical groups, views with apprehension the effects of the present regulation of Selective Service which makes no provision for the deferment of young men inclined for entrance into premedical education. It believes that continuation of this policy will inevitably result in a lessened production of doctors when more rather than less will be urgently needed.

At this time when veterans' needs, increased demands of military establishments for more doctors and greatly intensified concern with national health exists, the present program of Selective Service of cutting down on the supply of doctors is indefensible.

We therefore urge that the Military Affairs Committee of the Senate (House of Representatives) take immediate steps to correct this situation in the interests of the public welfare.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Thomas A. McGoldrick, Chairman, presented the following report, which on motion of Dr. McGoldrick, duly seconded and carried, after discussion, was adopted section by section and as a whole:

1. Proper Utilization of Services of Physicians in a National Emergency: This statement was formulated by a committee appointed by the Board of Trustees after giving consideration to a suggestion made by Dr. James E. Paulin with a view to proper utilization of the services of physicians in a national emergency.

2. Celebration of Centennial of the Association: The Board of Trustees suggested that the House of Delegates authorize the speaker to appoint a committee to work with the Board of Trustees in the development of a program for the celebration of the centennial in Atlantic City, and your reference committee recommends that the House of Delegates authorize the Speaker to appoint such a committee.

3. Report of Secretary:

A. Membership: Your reference committee notes with pleasure the gain in membership in spite of the war.

B. Fellowship: The decrease in the number of Fellows was more largely due to the fact that thousands of Fellows were serving with the armed forces in all parts of the world. Your reference committee recommends that this House of Delegates authorize the restoration of the names of all Fellows assigned to active duty if they so request.

C. Activities: Your reference committee notes the splendid way in which the many component bodies of the American Medical Association have dealt with the many problems of the times.

D. Appreciation: Your reference committee notes with deep appreciation the amount and high quality of service rendered by the Secretary. His service deserves special commendation because of the condition of reduced personnel under which his work was performed.

4. Plan of Distribution by the American Red Cross of the Dried Blood Plasma Declared Surplus by the Armed Forces: Your reference committee recommends approval of the plan submitted, which will be published at a later date.

5. Liaison Officers: Your reference committee endorses the commendation of the Board of Trustees for the fine services of the late Col. Charles G. Hutter, M. C., U. S. Army, of Lieut. Col. H. C. Luth and of Lieut. Col. R. D. Bickel, which were rendered in accord with the highest traditions of medicine and of the U. S. Army. It recommends that the House of Delegates approve these commendations.

6. Date of the San Francisco Session: The dates selected by the Board of Trustees for the San Francisco Session of the Association are July 1-5, 1946. Your reference committee recommends that the House of Delegates approve the place and dates for the 1946 session.

7. Report of Board of Trustees:

A. General Report: A study of the Report of the Board of Trustees as published in the Handbook and of the supplementary

report reveals the tremendous amount of work done by this body. It shows the amount of unselfish service to the many duties and responsibilities devolved on them. The very careful management of the income of the Association and the close attention to every expenditure for the protection of our resources should be fully recognized by every member of the medical profession. Your reference committee recognizes that the work of the Board has been performed under abnormal conditions of wartime and particularly with a greatly reduced personnel necessitated by government regulations. It notes with satisfaction the increased circulation of our journals and commends the maintenance of the high quality of the material offered by them.

B. Joint Committee on Physical Fitness: When the Congress of the United States failed to supply the necessary funds, this joint committee was forced to disband. The Board of Trustees recommended that organizations in the individual states cooperate with other agencies in the ultimate formation of a foundation under voluntary auspices to be known as the Keep Fit Foundation.

C. Bureau of Investigation: The work of the Bureau of Investigation by its constant collection and distribution of information has been of inestimable value to the state organizations, physicians, departments of government and the public at large. In 1944 there were 3,000 inquiries on 4,600 separate subjects. Among the leading subjects of inquiry were diabetes "cures," vitamin preparations, so-called "alkalizers," laxatives, cancer "cures" and various products that are advertised over the radio and in the lay press. It is urged that more physicians avail themselves of this valuable source of information.

D (1). Council on Physical Medicine: Your reference committee reads with great interest the report of the activity of the Council during the past year. The amount of work has been very great. The Council has made thirty-two reports, and other devices have been investigated and will be reported on later. Your reference committee noted the cooperation of the Council with the Federal Communications Commission in an effort to solve the problem of electrical energy from diathermy apparatus interfering with radio transmitters. It is expected that all diathermy equipment manufacturers henceforth will maintain the frequency within the limits prescribed and that within a period of probably five years the existing apparatus now held by physicians will be screened or new equipment purchased will be frequency controlled.
